The climate and soil of Northern Michigan are well adapted to the growth of all the fruits mentioned. In fact it is a very good region for general fruit growing, although peaches are rather tender there. The Delicious apple originated in Iowa where the temperature goes down to 30 below zero at times. The Wolf River and Wealthy are still hardier and are among the safest to plant in Wisconsin and Minnesota where they originated. Northwestern Greening is another good one. The Montmorency is the best sour cherry to grow there for market. Trees two years old are the limit as to age and one-year-olds are as good but either will be all right. About five or six quince trees are enough for home use on a small farm. Orange is the best variety to plant there.

H. E. VAN DEMAN.

Saving the Soil.

A few years ago Mr. B. F. Viquesney, of West Virginia, wrote us about a farm proposition. The soil he had in mind was wet, sour and very poor for most crops. There was a supply of wood ashes which could be obtained at a low figure, but to most men the outlook did not seem brilliant except perhaps to the untried imagination of a back-to-the-lander. We advised draining this poor land as far as possible and building up the soil by means of cover crops with the wood ashes to start them. Now we have the following letter to show what has happened:

I have about 15 acres, of which I planted three acres in potatoes. They produced about 1,400 bushels; half an acre entered in a contest produced 325 bushels; 1½ acres of cabbage 60,000 pounds, at 1½ cents per pound. Potatoes are selling around $1 per bushel. I had about two acres of sweet corn, and produced about 2,000 dozen, and same plot in the sweet corn had green beans, turnips, rutabagas, parsnips, peas and a general garden crop. When all is sold I shall have over $3,000 worth of goods; beside this had pasture for two cows and two horses, and cut hay, etc. So much for under drainage, wood ashes and cover crops. I don't use much stable manure because I cannot get it, and the crops that I am plowing down every year are cheaper made than buying manure.

There are many places throughout the country where soil of this kind can be made to "come back" and go into production. It should be deep soil with fair quality to start with. Drainage will take out the water, lime will sweeten it, and cover crops will fill it with organic matter, and in time make it "productive soil." Sometimes it is possible to buy ashes or other wastes at a very low price, to take the place of lime or fertilizer. A man must have capital and courage and great patience to carry such a job through, but it can be done.

363.1 Bushels Potatoes

From One Acre of Massachusetts Land

A. Webster Butler of Brockton, Mass., won the first southern zone prize offered by the Bowker Fertilizer Company for the largest yield of best quality potatoes grown exclusively on Stockbridge Potato Manure. His acre was a "rocky loam" producing about 2 1-2 tons of hay per acre in 1912 on manure. Rows were 36 in. apart and Green Mountains cut to two eyes were planted 14 inches apart. The piece was cultivated five times. The acre was sprayed with Pyrox.

STOCKBRIDGE POTATO MANURE

was applied 2100 lbs. broadcast and 700 lbs. in the drill. No other fertilizer or dressing of any kind was used. The entire crop weighed 21,783 lbs. or 363.1 bushels. His total score including quality points was 589 points, the highest in the southern zone.

Other Winners secured yields ranging from 311.1 bushels to 502.6 bushels in the northern zone, (Me., N. H., Vt.,) and from 183.8 bushels to 363.1 bushels in the southern zone, (Mass., R. I., Conn.)

Send us your name for complete and intructive statement concerning the results of the contest and how these great yields of potatoes were obtained. No other fertilizer than the Stockbridge Potato Manure was used.

P-H-O-S-P-H-O-R-U-S
THE MASTER KEY TO PERMANENT AGRICULTURE

Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.

DAYBREAK ROCK PHOSPHATE
13% Phosphorus, Ground 95% Through 10,000 Mesh Screen

Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficient in Phosphorus, and the the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to the first 100 farmers who write to us for delivered prices on *Rock Phosphate,* and state where you saw this ad.

Cover Crops on the Turning Row.

We expect to put in 15 or more acres of corn for silo, will have to rely on the horse and two-row cultivator. We drill in the corn, so can go but one way to cultivate. We expect to leave about two or three rods at the ends of corn rows to turn the team on each side of the field. We wish to sow this strip of ground to oats, millet or Hungarian to cut and cure for Winter feed. Which do you think would stand the hard usage best by the time the corn was too large to cultivate? S. S.

Little Falls, N. Y.

This is a new proposition to us; we have never seen it tried. If the corn is properly cultivated, the crops at the end of the field would be so badly trampled down that it would be hard to cut them. The best crop for such a purpose would be a late one, which could make its best growth after the corn was laid by. For such a crop we should prefer Japanese barnyard millet. Seeded early in July on good soil and with a fair amount of moisture, this crop would make a fair quantity of cow feed by September. You might sow oats earlier, cut what was left after the tramping, then work up the ground and follow with Japanese millet. But if the corn was well tended these oats would not amount to much. At the last cultivation of this corn, we should seed a combination of barley, Crimson clover, and Cow-horn turnips. These turnips will be a fair amount of feed; the Crimson clover will provide pasturage, and the barley will give a fair amount of hay late in the season after the corn has been taken off. Another plan would be to wait until the cultivation was ended and then sow barley and Canada peas.

Life in Sunny Florida.

The two pictures shown on page 251 came to us at about the same date, and were apparently taken just about the same season of the year. We print them to show in a striking way what a big country this is, and how wonderfully conditions vary as the seasons go on. The boat landing shown is built near Fort Myers, in Florida, and is a typical scene in that country. All through the Winter the ground is open, and there are very few frosts to trouble vegetation. Considerable of the travel, and a good deal of the recreation is taken in a boat, for by stepping into this boat an oarsman can quickly get himself over to the neighbors, or can fish, or enjoy himself upon the water. It is truly life in the open air under Southern Florida skies during this season.

The other picture, taken at about the same time, shows what was happening in Northern Pennsylvania, even in this Winter of light snowfall. If a man was situated so that he could spend three or four of the colder months near this Florida boathouse, and then go back to the cooler North for the rest of the year, he would have in theory at least an ideal way of passing through the seasons. Some of our readers do this, but it requires considerable capital to carry out such a plan, and is really more of a play than work.

Florida is certainly a beautiful place, or at least parts of the State may be called so for spending the colder months of the Winter; provided, as we have said, a man has the price and doesn't much care whether the Florida farm pays or not. As for giving up the Northern home entirely, and going to Florida for the purpose of making a living and building a home, it is an old story that no definite advice can ever be given a man who has never lived in the Southern States. The conditions are so utterly different that we have found it practically impossible to get our Northern readers to clearly understand what they will find south of Jacksonville. We have letters from readers who say they are entirely satisfied with Florida and the conditions there, and that they could not be induced to return. On the other hand, people write us the most bitter letters, saying that they have been deceived, and that they would gladly sell out if they could find anyone to buy their property. These two extreme views are always presented whenever we say anything about Florida, so that it becomes more and more evident each year that the personality of the man who goes to the South must be considered in giving any advice, and, as of course a stranger cannot know about this personality, it is a foolish thing to undertake to tell such a man just what he ought to do. The only advice worth giving is, never, under any circumstances whatever, buy land in Florida from an agent, or anyone else, without going there and looking the land carefully over. Personally, from our own experience, we never would buy such land until we had lived at least one full year in the neighborhood, and thus had a good chance to study the seasons all through.

As for trading Northern property for a Florida farm, without seeing the property, it is just about five times as much of a gamble as swopping horses in the night, or trading jacknives "sight unseen."

Otsego County, New York.—A Sensible Statement.

I was interested in the comparison of Schoharie and Otsego Counties as drawn by Mr. Kling on page 145. I think he is certainly one who believes in giving the first honor to his native home. Mr. Kling is correct in thinking that Otsego County is not in the front in corn growing, and in fact it is not much on any crop requiring hot weather, but the high elevation of any part of the county has it advantages as well as lower sections have. Mr. Kling seems to think Otsego County is not much on grass or grain, but I should take it he has never traveled in this county. I have been around in New York State some, and I think the hay and grain crop here will compare well with any other county, and if Schoharie County can beat Otsego in its big up-to-date purebred cattle farms it is certainly well to the front. The State Agricultural Department reports that around Richfield Springs in the northern part of the county seems to be the most favorable place for the chicken and hen business in the State, or at least that is the conclusion they seemed to draw by the flourishing business there. I think it would be a good thing if THE R. N.-Y. could print more articles along this line, comparing locations, etc., for it would tend to show farmers that they should fit their farming to the location. As for Otsego County, while we cannot compete in growing a certain line of crops like corn, tomatoes, beans, etc., yet besides the dairy or hen business the climate and soil is, I think, well adapted to potatoes, especially in growing high vitality seed potatoes. From my experience I feel sure I can raise just as good potatoes here for planting purposes as they can in Aroostook County, Maine or in northern Michigan. I have bought potatoes from both these sections, planting them by the side of my home-grown stock here, and have never yet seen enough difference to pay for changing seed; in fact I have decided that I would prefer my own seed stock even if it cost me more. One trial, especially, I made with Aroostook County seed planted by the side of my own seed stock, I could plainly see the difference in favor of the home-grown stock, and the comparison was made with common stock and not with special select strains.

I mention this to show that one should find out what his section is best adapted for, and not waste his energies on some crop not adapted to his soil and climate. While traveling about I have repeatedly noticed potato fields in lower sections of the State dead with blight, while getting back to the high altitude of Otsego County I would see potato tops in a green healthy condition. The northern part of Otsego County is especially noted as a health resort; the dry cool air and absence of much fog or damp weather making it far better for many people than lower sections. While the Winters are cold and long, with usually deep snow, the Summers are ideal, and about as perfectly adapted to certain crops, like potatoes, some varieties of fruits, etc., as can be found anywhere, and I think about as good average soil and rainfall. CHARLES L. TODD.

Otsego Co., N. N.

Quantity and Quality Characterize Crops Raised With

E. FRANK COE FERTILIZERS

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

Mr. L. S. Bean, of Aroostook County, Maine, specializes in Potatoes of Quality.

His entire crop is purchased for seed purposes by Messrs. Peter Henderson & Co., of New York, whose standard for seed potatoes is the highest.

The photograph shows Mr. Bean's men digging a field of Irish Cobblers that yielded 418 bushels per acre. On another field Mr. Bean's yield was 566½ bushels per acre, all raised with E. Frank Coe Fertilizers.

Mr. Bean's record with E. Frank Coe Fertilizers is as follows: In 1911, 10 tons; in 1912, 90 tons; in 1913, 150 tons. He expects to use more in 1914. Is there a thought here for you? If so, write us.

THE COE-MORTIMER COMPANY, 51 Chambers St., NEW YORK CITY

Hope Farm Notes

Here is a new one along the line of "The best meal I ever ate." The following statement was made in the daily papers last week:

John Quinn, who weights 250 pounds, recently took dinner at a restaurant with his friend Robert Harris. Quinn made an excellent meal, and after it was finished leaned back in his chair with a deep sigh of satisfaction, all ready for a pleasant conversation with his friend. He did not realize, however, the expansive power of a sigh in a man of his weight. The sigh broke a horn button on his vest. The pieces flew with such power that they struck Harris in the face, probably destroying the sight of one of his eyes, and cutting a deep gash on his cheek, so that the blood ran freely down his face.

I was not there to see this, but it is not impossible, for some of the forces of nature have remarkable power. I am told that a skull may be split or burst open by filling it with beans and pouring in warm water. The expansive power of the beans splits the skull. No doubt there are New England people who will read this and then clear their throats and make certain remarks concerning the close connection between brains and the baked bean habit. At any rate the expansive power of a fat man in giving a sigh of satisfaction is something to remember. And it is the meal back of the sigh which provides the power! Ten to one this man had finished off with a nice baked Baldwin apple, well covered with cream. There may have been in that sigh a bit of the dynamite of disappointment that he could not eat another apple. The Mexicans might organize a regiment of fat men, put bullets instead of buttons on their vests, feed them well and put them in the front rank! Our cooks and housewives will have to be careful how they feed these fleshy veterans. Gentlemen—*have another apple*—but please do not face me.

Will you read the inclosed clipping from a Washington paper and tell your readers what you think about the truth of the statement? It would require a yield of nearly 41 bushels of apples to a tree, and 40 trees to the acre, to produce 1,617½ bushels of apples, which would have to sell at $2 a bushel to bring the amount of money mentioned. I have been raising apples more or less for the past 33 years, and I am guessing how he managed to do it. Can THE R. N.-Y. give me and others a pointer?

Connecticut. Z. C. B.

"Wenatchee, Wash., Jan. 9.—An average of $3,235 per acre annually for seven years is the record made by L. W. Smith on the gross receipts from sales of fruit grown on his five-acre apple orchard on North Wenatchee avenue."

No. I am out of "pointers" on such matters. The experience of one of my boys has rather blunted the point to such a story. This boy wanted to see the world, so he went West—where he is now. He packed apples for a time at this place, but could not earn enough money to carry him over Winter. There seems to be nothing to do in that country. How this man raised 41 bushels of high-class fruit to a tree beats me. He may be like the man recently mentioned who bought four crops besides his own, packed them all in his orchard and then claimed the fruit all came out of his own farm!

BLIZZARD AND BLUFF.—Hope Farm lay right in the track of the blizzard of February 15, and the wind made tracks all over us. It whirled the snow into great drifts, and blew the frosty air into every crack. There was a surplus of buckwheat flour and sausage and fuel, and the joy of the children was unbounded, as they wallowed in the snow. We broke our way to the railroad, but getting back at night was something of a struggle. Mother met me with old Jennie and the sleigh. Flat in the freezing snow lay a man who had tried to warm up with the wrong kind of spirits. He had no overcoat or mittens and a basket full of groceries lay beside him. While Mother held the lines on the old black horse I bundled this unfortunate friend into the sleigh, got the horse blanket over him, and held him in until we got him to his home. There seem to me some unanswerable arguments for Prohibition. The house was warm and bright when we finally reached it, with a pot of smoking hot baked beans on tap. Then before the roaring wood fire, with the children playing about, I was well content to let the wind howl and play with the drifting snow.

It is a glorious place before an open fire to read over your letters. There you get the full spirit of them, and the shy sentiment which often hides between the lines gathers courage to crawl out and show its head. There might be unbounded chances for "making a hit" in the following note:

In looking over the files of THE R. N.-Y. we were much interested to learn that you had known Emerson. I am going to travel all the way to New York to ask you to tell me more about it some time. I read him every day; indeed should find it hard to live without his unfailing inspiration. To have seen and spoken to him seems to us of the younger generation, a rich allowance from fate.

J. D. F.

Now it is something of a temptation to come forward as an old friend of Ralph Waldo Emerson. Who would be likely to disprove it? With a little spur to the imagination I might perhaps give a new color to the "Sage of Concord." Before we start, however, let's open Emerson's Essays at random and see what we get. Here it is on page 243 of the essay on "Intellect."

"God offers to every mind its choice between truth and repose. Take which you please—you can never have both. Between these, as a pendulum, man oscillates ever. He in whom the love of repose predominates will accept the first creed, the first philosophy, the first political party he meets—most likely his father's. He gets rest, commodity and reputation; but he shuts the door of truth."

After that there is nothing for me to say except that when I spoke to Emerson he was the great philosopher, and I was a chunky little errand boy in a book store, homesick in the great city. The great Emerson, with other great authors, sent me out to buy a bag of peanuts. When I got back they wanted me to eat peanuts with them, and in a half bantering way led me on to tell how I had caught fish through the ice. I know that philosophers eat peanuts like other men, and throw the shucks on the floor. When they are not writing for publication they can, on occasion, produce some very ordinary "guff." About the most human description of Emerson I have read is found in "My Own Story," by J. T. Trowbridge—another man who used to keep the Hope Farm man running on errands—once at least in just such a blizzard as the one that has recently stung us. I remember too that some of these great and kindly men "chipped in" and bought me a pair of rubber boots and a coat one hard Winter, when there was no one else to do it. Who could help picking up the reading habit from their books after that?

In your issue of December 6 you say, "Remember that the parents of next year's mosquito crop are probably wintering in your cellar!" What can one do about it? I for one would like to know, for we have to fight them here sometimes for months. E. W. C.

Jonesboro, Ark.

It does not look much like mosquito weather as we look out to the snow drifts and see the wind whirling them, but it may be time to get ready. Some of the mosquitoes winter over in the cellars of farmhouses, tucked away in cracks and corners. Leave them alone, and when Spring opens these pests will come out very ready for business. Brush down all the cobwebs and dirt and burn. Then fumigate the cellar or lower warm rooms. The following "stuff" is suggested for killing those wintering mosquitoes:

Jimson weed (Datura Stramonium) is used for fumigation. Eight ounces of the powdered weed, burned in a close room, will fumigate 1,000 cubic feet. Another material is made by using equal parts by weight of carbolic acid crystals and gum camphor. Put one pound of carbolic acid crystals in a bottle and liquefy by placing the bottle in hot water. Put a pound of gum camphor broken in small pieces in a one-quart jar. As the acid liquefies pour it over the gum camphor. When all has dissolved there will be one quart of a slightly reddish heavy liquid, which will keep indefinitely if covered. Three ounces of this evaporated by burning in a metal pan over an alcohol stove will kill flies and mosquitoes in 1,000 cubic feet of space and not injure carpets or furniture. H. W. C.

So. New Berlin, N. Y., Dec. 10, 1913.

The Rogers & Hubbard Co.,
Middletown, Conn.

Gentlemen—Hubbard's "Bone Base" Fertilizers have given us the best of results this season. We used on 4 acres of Danish Cabbage 1 ton of Hubbard's "Bone Base" Fertilizer for Oats and Top Dressing and 1 ton of Hubbard's "Bone Base" Complete Phosphate. Applied with fertilizer sown and harrowed in just before plants were set. About August 15th 400 pounds of Hubbard's "Bone Base" Fertilizer for Oats and Top Dressing was sown broadcast over the field and worked into the soil. No stable manure or other fertilizers were used. The crop made a strong growth from the start and fully 75% of all plants set produced marketable heads. We sold from the 4 acres 59 tons by weight and about 3100 heads that were not weighed. The Cabbage crop, as a rule, was very light in this section, and we believe our yield was due in a large measure to the use of Hubbard's "Bone Base" Fertilizers.

Yours truly, FRED. GROVER.

Ruralisms

Caring for the Easter Plants.

Every Spring we see an increasing number of flowering plants grown for the Easter season; they are no longer a luxury of the rich, and the big cities absorb enormous quantities of such stock. A woman who receives some blooming plant as an Easter gift usually wishes to preserve it for another season, but this is not always practicable. Some forced plants are quite hopeless under domestic conditions; others will give a rather shabby growth, while a few offer abundant reward. We would never advise keeping worn-out or crippled house plants; window space is too valuable, and only those likely to do well should be retained.

The beautiful greenhouse Azalea, always a leader in Easter plants, is simple of culture, and entirely suitable to grow on for another season. Regular watering is very necessary, but not a soddened soil; an Azalea in full bloom uses much moisture, and will suddenly flag if neglected. As the flowers begin to fade they should be carefully picked off, no seed formation being permitted. As soon as danger of frost is over, the plant should be put outdoors, in a place partially shaded, where it is well to plunge the pot in the ground, first putting in the hole an inch or two of coal ashes, to prevent earthworms from entering the pot. Here the Azalea remains until September, when it is brought inside. During the Summer it should be watered abundantly, and also the foliage frequently syringed, which will prevent attacks of thrips and red spider. Abundant new shoots form during the growing season. If, another year, it has grown enough to demand a larger pot, the proper time for shifting is after flowering, when the new growth commences, the soil being a well-rotted compost of leaf mold, peat and fibrous loam. Potting must be done very firmly, the soil being well rammed down the sides of the pot.

What to do with the Easter lilies is very promptly answered by the florist; he deposits the spent bulbs after forcing on the rubbish heap. The window gardener, however is moved both by thrift and sentiment to try keeping over such bulbs for another season. Supposing the plant to be considered the regular Easter lily (Lilium longiflorum) the bulb should be left in the pot in which it has been forced, and watered as though it was still in bloom, keeping it in a light sunny place. As soon as danger of frost is over the pot may be plunged outside like the Azalea. An occasional watering with very weak liquid manure will help its growth. This care should continue until about August, when the leaves will gradually wither and die. At this time water should be gradually withheld until ripening is complete, when the bulb, still in the pot, should be stored in a dry cellar. In October shake the dry soil from the bulb, and replant in a clean pot, using abundant drainage material in the bottom, and a compost consisting of two-thirds loam and one-third well-rotted manure. Set the bulb in the center of the pot, with two inches of space above it; barely cover with soil. More soil is added as growth starts, to furnish a growing medium for stem roots. Keep the pot in a cool cellar or plunged in a frame outside until plenty of roots are formed, when it may be put in the greenhouse or window.

Small Spring bulbs, such as hyacinths and tulips, that have been forced for Easter, may be ripened in the pots until frost is over, and then planted outside, along the edges of shrubberies, or in perennial borders. They are unlikely to flower the following Spring but are quite satisfactory afterwards. Some may be too much weakened to survive, but most of them give fair results. This applies to Dutch hyacinths, only; the tender little Romans do not survive with us in the latitude of New York. The Paper White Narcissus and Chinese Sacred Lily are not hardy here either, and we think it wasted effort to try forcing them a second season, nor have we had any success with forced lily of the valley afterwards.

The Cytisus or yellow broom, with its mass of golden pea-shaped flowers, is a handsome Easter plant, but we have not found it satisfactory in the living room. If it is desired to keep a plant over, it should be cut back after flowering, and then be kept near the window while it makes new growth, with moderate watering and frequent syringing to keep down red spider. During the Summer it may be plunged out of doors in a sunny place, and brought in before frost.

We do not recommend keeping over Cyclamens from one season to the next, as the plants freshly grown from seed are superior to those from old corms. Cyclamen culture was discussed in our issue of December 20 last.

Hardy roses forced in pots for Easter should have the faded flowers cut off, and may be treated like greenhouse stock; that is, carefully planted out in May, when danger of frost is over. The climbing rose Dorothy Perkins is forced in enormous qualities for Easter sales, and does well in the garden afterwards. We do not advise roses as window plants, though sometimes Teas and Hybrid Teas are seen under these conditions doing fairly well. As a rule, however, foliage troubles and scanty bloom result in shabby and discontented specimens, and it is wiser to give window space to other plants, and be content with garden roses.

The Rhododendrons forced for Easter are usually tender sorts, not suitable for outside planting; they may be handled like Azaleas, but are not very suitable for house culture. The tender Hydrangeas of the Hortensis class are quite manageable, but they take up so much room that it is wiser to flower them at their natural blooming time in the Summer, with protection during Winter here in the North. They are especially desirable in large jardinieres for porch decoration.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

RHODES DOUBLE CUT PRUNING SHEAR

Cuts from both sides of limb and does not bruise the bark. We pay Express charges on all orders. Write for circular and prices.

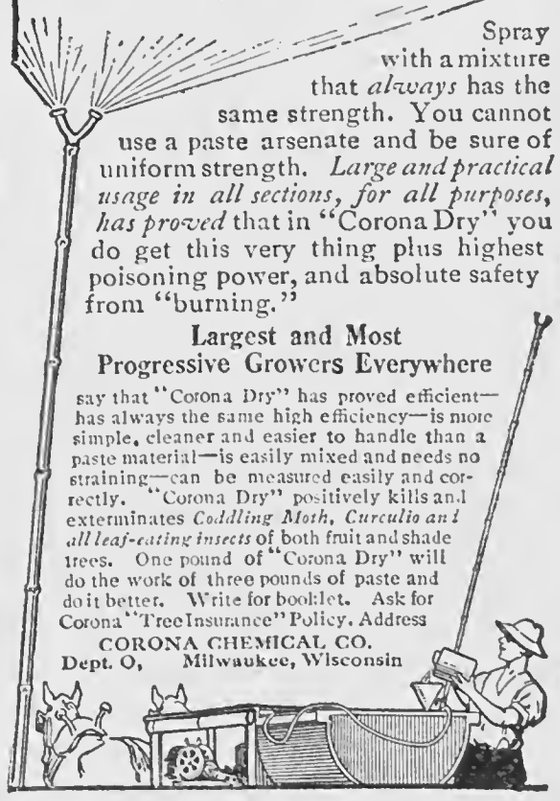
"CORONA DRY"
Arsenate of Lead
Patented June 10th, 1913

Eliminates guesswork. Standardizes the strength of the spray mixture. Saves work in mixing—no straining needed.



Spray with a mixture that *always* has the same strength. You cannot use a paste arsenate and be sure of uniform strength. *Large and practical usage in all sections, for all purposes, has proved* that in "Corona Dry" you do get this very thing plus highest poisoning power, and absolute safety from "burning."

Largest and Most Progressive Growers Everywhere

say that "Corona Dry" has proved efficient—has always the same high efficiency—is more simple, cleaner and easier to handle than a paste material—is easily mixed and needs no straining—can be measured easily and correctly. "Corona Dry" positively kills and exterminates *Coddling Moth, Curculio and all leaf-eating insects* of both fruit and shade trees. One pound of "Corona Dry" will do the work of three pounds of paste and do it better. Write for booklet. Ask for Corona "Tree Insurance" Policy. Address

CORONA CHEMICAL CO.
Dept. O, Milwaukee, Wisconsin

15 MINUTES TO THE ACRE

That's all it takes. Just 15 minutes to the acre with a SPRAMOTOR, twice, three times during growing season and you will have good crops in poor years and bumper crops in good ones. Care for your own crops first, then make big money spraying those of your neighbors. One season's work will more than pay for it, save you money, make you money.
There is a SPRAMOTOR built for every purpose. Simple in construction. Nothing to get out of order. Guaranteed. Write for free, profusely illustrated booklet "A Gold Mine On Your Farm."

SPRAMOTOR COMPANY

121 Erie Street, Buffalo, N. Y.
171 King Street, London, Ont.

HAMILTON-MADE
SPRAYING HOSE

will spray your trees for several years for one cost.
½-in. PERFECT spray hose, 6 ply, 50-ft. pieces coupled, or
½-in. STERLINGWORTH reel spray hose in 500-ft. lengths.
Either grade will stand 600 pounds test and will be satisfactory for any power or hand sprayer,

$15.00 FOR 100 FEET
Cash with order

Freight paid to your station. Shipped direct from factory the day the order is received.

Let Me Send You
MY NEW BIG BOOK
"Why, How and When to Spray"
FREE

HURST

EVERY farmer, truck- or fruit-grower needs this book. It is more than a catalog. Contains 74 different illustrations from photographs of insects and plant diseases that rob the grower of his profits. It gives full details as to how to combat these pests, the various remedies which experiment has proven successful and directions as to how and when to apply them. The book also contains illustrations, some in colors, of the famous HURST SPRAYERS—28 different styles and sizes—from small hand power outfits to large gasoline engine sprayers for field and orchard. It explains in detail the liberal terms on which HURST SPRAYERS are sold—

10 Days FREE Trial—5 Year Guarantee
No Money In Advance—No Freight To Pay

I will ship you any HURST SPRAYER on 10 days free trial, without one cent in advance—no bank deposit—no agreement to keep and pay for the machine unless you are thoroughly satisfied. Our liberal selling plan gives you your own terms of payment. The sprayer will pay for itself in the extra profits of one season. I want to tell you about our

Money Saving Offer This offer goes to the first buyer in each locality this season. So write today. Tell me what size sprayer you need or what you have to spray and get my big free book and raise bigger, better crops, and increase your profit.

E. H. LAMIELL, General Manager
THE H. L. HURST MFG. CO., 287 North St., Canton, O.

Orchard and Garden will bear better

They will also bear choicer crops if you assist nature by Spraying. Fight rust, blight, bugs and all foes of plant life by spraying at the right time in the right way with the right tools. For thorough work and best results, men who know, use

Deming Spray Pumps

The "Gardener's Choice", shown herewith, is one of the most convenient outfits for general use. As a good, allround sprayer, it cannot be beaten. Equally useful for garden, greenhouse and orchard work. Splendid for spraying livestock, whitewashing and many uses to which a good spray pump may be adapted. A strong pump of simple construction. Perfect workmanship and A No. 1 material make it practically trouble-proof. All parts are of easiest access. Ask your dealer for Deming Sprayers, Deming Nozzles and "Deco" Hose.

Complete Catalog & Spraying Guide

is gladly mailed free to all who are interested in farming and gardening. Guide gives formulas and tells how and when to spray. Catalog fully describes Deming Spray Pumps for every need and purpose. Most good dealers sell them. Write us for catalog **Today.**

DEMING PUMPS THE WORLD'S BEST

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

A GOOD suggestion from Mr. Todd on page 305 Each county of New York State can show soils and conditions which make it specifically desirable for certain definite lines of farming. For example, Wayne County and the Hudson Valley are superior for fruit growing, central New York for dairying and so on. Instead of claiming that every product of the temperate zone can be successfully grown in each county it would be far better to state the few particular things which each county can produce in superior quality. This is an age of specialties. A man should know what he wants to produce, and then go where the conditions are right for his crop.

*

THIS education in the 35-cent dollar school goes merrily on. Collier's Weekly has got up into fractions after the following example in division:

> Mr. J. M. is foreman of the composing room which prints *Collier's*. Several weeks ago he bought a barrel of Greening apples in Ulster County, New York, for $1.50. He had them shipped to a suburb of New York City, about one hundred miles away. The express bill was $1.67. These apples cost the consumer $3.17, but the farmer got less than 50 per cent of it. During all this time there were more apples in Ulster County than could be used there, and there were more people in New York who wanted apples than could afford to pay for them. The best of farming papers, THE R. N.-Y., talks a great deal about the 35-cent dollar—meaning thereby that 35 cents is the portion of the consumer's dollar which the farmer actually gets. Isn't this something we can improve upon?

That farmer paid at least 35 cents for the barrel, which left him $1.15 out of $3.17 with which to settle his bills and pay himself a profit. If the apples had gone through the regular trade of commission man, dealer and retailer they would have cost about $4.50 and the farmer might have received $1.25 net! It is a great thing to have these concrete examples crawl into city printer's ink. Many of the better class of magazines have presumed that the blind stupidity and malignant hatred of farmers which the city daily papers show were evidences of wisdom. Thus the farmer has been pictured as responsible for high food prices, and growing rich through his extortions. The medicine needed to correct this bilous view of business is just such experience as Collier's relates.

*

THE supply of limestone in Ohio is practically inexhaustible; its manufacture is simple and inexpensive; and freight rates for carload lots are often less than one dollar a ton. When a high-grade limestone is finely ground, it is as good as the best carbonate of lime on the market, and can usually be secured with freight paid for less than $2.50 a ton. However, it is not uncommon to find farmers who are paying as much as $7 a ton for another form of carbonate of lime sold under a fancy trade name.

That statement from the Ohio Agricultural College is correct, and the trouble is not confined to Ohio or to lime either. Give us the money which farmers have paid for "fancy trade names" and many a wealthy citizen would go to work, while the National debt would look small. There was a man named Jacob G. Brown who tried to do business with his neighbors. "Nothing doing," they all knew "Jake Brown." He went to another county and had a card printed J. Granville Browne, and business came to him on the jump. The fancy trade name is usually a fake and a bluff.

THE express companies are controlled by what one of our readers calls "a smart bunch of men." They are smart enough to work out of a hard situation, but were not wise enough to avoid it. Had they been able to judge public opinion they would have given the public such rates and service that parcel post could not have been obtained for 20 years! Now they are preparing to give parcel post a hard jolt. The new express rates are much lower for weights over 10 pounds and beyond 150 miles. Thus the express companies are preparing to carry the long hauls and then use the parcel post to deliver the goods at the end of the journey! In this way they expect to underbid the parcel post by making the government work for them on the short delivery. It is a very smart scheme and there is only one way to meet it. That is lower the parcel post rate so that the government can meet the express companies on all hauls. This is what we must work for now.

*

MY husband passed on last July, and I was obliged to give up my little country home and remove to the city, therefore did not expect to have any use for an agricultural paper. I am fortunate in being able to retain a flock of fine fowls, and recently found myself in a puzzling situation in regard to disposing of the refuse from the pen. While discussing the matter with the family the carrier left THE R. N.-Y., and I opened it remarking that "I must stop this paper." At the same time, glancing over the pages, I came upon the very subject that was troubling me, and my problem was solved. Thus it is with every copy. I always find something that I am interested in, so have come to the conclusion that I cannot get along without THE R. N.-Y. MRS. S. M. F.
New York.

Every day brings just such evidence as is found in this letter that readers of farm papers consider the subscription as a plain business matter. When they spend a dollar for food or fuel or clothing they expect a full dollar in value. It is right to extend the same principle to the farm paper. The editor and publisher have no right to expect any man to pay his money unless he feels that he receives a full equivalent in value. Now and then we are criticized for giving space to common things—"which everybody ought to know!" Such critics say we should discuss only the newer and "larger problems" of agriculture. Probably one of the best assets we have is a thorough and confidential knowledge of what our readers want and need to help them in their daily problems. We try to fill this need first of all without neglecting the "larger problems" as they arise.

*

YOU are the best scrapper I ever knew that claimed he didn't like war. W. A. S.
Montana.

There is quite a difference between war and "scrapping." Carlyle's essay suits us well as a statement of what war means to the common people. He pictures 30 stout farmers and laborers taken from their families and occupations in an English village and carried to Southern Europe. There they are matched against 30 Frenchmen taken out of productive life in the same way. These 60 men take guns and shoot at one another. They have absolutely no personal quarrel. As poor men, the under dogs of society, they have interests in common and ought to get together as men and make their labor freer and their lives happier. But no—they shoot and kill until half are dead. They do not know what it is all about, or why they should fight, and their lives are made harder and more miserable because they fought. A few big men pull the strings—out of danger—and the common men face the bullets. That is war. It is always "a rich man's war and a poor man's fight." You cannot name a war which did not finally assume that character. Various ideas or emotions prompt men to leave home and fight, but the ultimate benefit goes to a few strong and far-seeing men. Again and again, in history "war" has been used as a scare to take the mind of the common people away from real thought about their wrongs and conditions. In a war the individual soldier can have no personal influence upon the question at issue. He has no more influence than a card or a checker in the game. The "scrapper" has personal and individual influence. It requires more of moral character to "scrap" against powerful interests when the cause may be right, but for the moment unpopular. Such a "scrapper" risks all he has, and years may be required to prove that he was right and that his vision was clear. He does not try to kill men, but attempts the harder task of trying to make them think. Again and again in history the "scrapper" has brought people to the point of clear thinking, only to lose it all in the bloodthirsty demand for war. These are a few of the reasons why we are glad to "scrap," but have no use for war.

As usual at this season there is some confusion regarding cow peas and Canada field peas. Some readers write us that they will sow cow peas with oats early in April. This is just the thing they ought not to do. The cow pea is a hot weather plant and makes its best growth in the hot weather of Summer. It is really a bean and very tender. To sow it in the Spring when one usually sows oats would mean ruin to the cow pea. The Canada field pea, on the other hand, is a hardy plant and will sprout and grow in cool weather. This Canada pea is the one to sow with oats for fodder or hay. Remember that the Canada pea is a cool weather plant which will not endure hot weather, while the cow pea is a hot weather plant which cannot stand the cold weather.

*

It is announced that Prof. W. A. Henry of Wisconsin offered a check for $300 to the manager of the first coöperative laundry in Wisconsin. This offer was made by Prof. Henry 18 years ago, and is now renewed by him. In order to meet the requirements this laundry will have to be owned and managed by Wisconsin farmers or their wives. It may be run alone or in connection with a coöperative creamery. It will have to be generally patronized by farmers, and the prize will not become available until the plant has been in operation at least one year. That sounds good. In the next magazine number of our "Woman and Home Department" we shall tell of a coöperative laundry conducted by farmers in Minnesota. It is the real thing. It cleans up the clothing, puts life into the neighborhood and starch into the backbone of many another coöperative enterprise.

*

WE have stated several times that some of the so-called "molasses feeds" contain what we call sweetened trash. This means that mill sweepings, which contain weed seeds, oat hulls, dirt and screenings are mixed with grain and smeared with molasses. This mixture of grain and trash is used as a carrier, so that the molasses can be fed in dry form. Manufacturers have criticized us for saying this—they say that no such stuff is used. Suppose we get past the manufacturer and the farmer and ask the feed. We have with us today Prof. F. C. Minkler of the New Jersey Station for a few remarks:

> I would say that by actual count 25% of the material found in one of the so-called molasses feeds contained nothing but weed seeds of the very worst sort. This analysis was made two years ago, and since that time those dealing extensively in the production of molasses feeds have taken the precaution of grinding their weed seed products, and thus make it harder to detect their presence. There is no doubt that screenings are used extensively in the production of the so-called molasses feeds. There is no doubt that molasses makes it possible to market a larger amount of wheat screenings, weeds and such products that could not be used at all in their present form, and certainly you are perfectly safe in making such assertions.

Now we think the honest molasses feed has a legitimate place in the dairy business. When we want to feed molasses we buy it by the barrel, dilute it in water and pour it over the fodder and grain. That is the cheapest way, and you obtain the full benefit. There are many farmers who do not care to do this. They prefer the dry form of molasses, and when they can obtain the genuine article at a fair price they are well justified in using it. When, however, they pay their money for sweetened dirt, weed seeds and trash labelled with some fancy name they are victims of a bunco game. There is no reason that we can see why the manufacturer of a molasses feed should not put a label like the following on his bags:

$1000 REWARD WILL BE GIVEN
For any weed seed, mill sweepings or indigestible matter found in this feed.

There would be nothing illegal about that, and they could not make the feed fast enough to supply the demand for it.

BREVITIES.

THIS is the season when good well-drained walks about house and dooryard would be appreciated. If cement or flagging is too costly, good results are obtained by drainage, a foundation of stones and surface of cinders.

HAS your system of vegetable storage proved satisfactory during this changeable Winter? House-cellar storage which permeates the living rooms with a charnel-house smell of dead cabbage and turnips is always to be avoided.

THE Philadelphia Quartz Company has offered a 10 per cent increase in wages to all employees who sign a pledge to abstain from intoxicants. The firm considers that the improved quality of work resulting, will fully make up the increase in wage.

THE death rate in New York City decreased last year, while it increased in the remainder of the State. The State Health Commissioner urges establishment of a Bureau of Rural Hygiene, which would be helpful, not only in controlling epidemic disease, but also in preventive measures.

WOMAN AND HOME

Social Needs and Possibilities of Country Women

By Dr. Kenyon L. Butterfield.

A response to the editor's request for a few words on this subject has been made with considerable hesitation. So much is now being written about country life, and especially about the farmer's wife, that is unwelcome, often unsympathetic, and not seldom uninformed, that one may well be cautious about adding words of unwisdom or vainly multiplying counsel. And especially if one be a mere man! Moreover, the life of rural women in many individual homes, and indeed in many farming areas, is so satisfying that any word of suggestion would be not only superfluous but ungracious.

My only reason for consenting to write on this topic is found in the unquestioned fact that not alone in multitudes of country homes, but even in wide stretches of country, the status of the farm homemaker is far from satisfying, her lot far from a happy one, and her life far from the ideal. I recall reading scores of replies to a question sheet sent out by the Country Life Commission, to country women, seeking light on woman's work, position, and ideas, in American farm life. Doubtless the discontented were the ones who might have been expected to reply; but the answers indicated the existence of many grievances, varying from inexcusable lack of sheer necessities for labor-saving, to pathetic isolation of life and meagreness of opportunity really to live—in all those realms that a human soul needs for growth. I believe, moreover, that the best single test of an adequate rural civilization is the farm woman's part and condition.

First of all, what are the chief social needs of country women? They are legion, but may be summarized in two brief statements: (1) Social contacts that are at once pleasurable and cultural; (2) leadership in securing these contacts. Just what is meant by this somewhat professorial phrasing? Well, we must admit that farm life is relatively isolated. The contact or association of person with person is less frequent than in the city. In extreme cases this becomes a serious deprivation, and brings in its train not only loneliness but a stunted mental and moral development. The need then in such cases is just plain sociability, friendliness, neighborliness—"contacts." The pleasures that arise from human association are both moral and necessary. In fact unless these associations are pleasurable they are of little value.

But there are all varieties of enjoyment. The pleasure that brings relief to loneliness, or gladness to sorrow, or substitutes laughter for tears, is good. But it is not all. We need the breadth of sympathy that comes from meeting people who live in other spheres than our own, who know more than we do, who have read and traveled more widely—people at least who have had different if not superior experiences. We must learn the pleasures of mutual expansion as well as of humor. Hence our "contracts" must be "cultural," or productive of mental and spiritual growth, as well as "pleasurable" or enjoyable.

Illustrations of this philosophy can be supplied indefinitely by Grange lectures and farmers' institute lectures. The lonely country woman awakened to her true life by institute speech, trained to growth and self-expression in the Grange—these are everyday occurrences. And they are precisely the sort of thing needed in thousands of farming communities and in tens of thousands of humble farm homes. Just the opportunity to gain a new life and a new joy by freer human association.

This process is often accomplished by the woman herself. But more often it comes because some other woman, stronger and freer, leads the thirsty one to the waters of life. This need for leadership is then the second great need among multitudes of country women, and is moreover the arena of largest possibilities for country women. This leadership may find its opportunity in at least four ways.

1. In making a "homey" farm home. There is no home in America superior to the best of our farm homes, in all that goes to make for dignity, simplicity, "sweetness and light." Nevertheless the absence of the things that count for most in home-making, is one of our rural deficiencies. The woman who can appreciate the type of furniture and pictures, the setting of house and its environment, most suitable for the rural life and attitude, avoiding both undue simplicity and poor city imitation, can render an immense service in country life leadership.

AN OLD FASHIONED GRANDMOTHER.

2. In establishing the "culture" point of view. The moment the word culture is mentioned, the feeling arises that something is suggested that can be the portion of the few, and something not quite consonant with kitchen work and other household duties. But true culture is appreciation of environment—mental and spiritual. There are degrees and kinds of culture. Every person has some culture of some kind or another. Think of the possibilities of culture in the open country. Nature and all her secrets, the processes of a great industry, the presence of problems that lie at the root of civilization and progress—all this is the material of culture, the rural environment. What shall be the country woman's attitude toward this environment? Shall there be intellectual curiosity and interest concerning the problems of field and market and community? Shall there be a spiritual response to the wealth of plant and animal life, the voice of the forest, the music of the winds? It is chiefly a matter of point of view, attitude—not primarily of capacity. The alert country woman can help create this point of view—that of culture or appreciation.

3. She can also assist in relating the home to the community. We are coming to cherish the idea of community welfare and development as the core of rural progress. The home may minister to the community need and betterment. The home-maker may find the walls of the home widening to take in the good of all the neighborhood. Leadership of a high order is needed here.

4. She may be active in those organized efforts that seek to crystallize with action, ideals such as we have been discussing—church, Grange, school, women's club, Sunday school, study club. In this way ideals will become realistic, personal influence find its widest outlet.

And through and beyond all activities, the country woman may learn that both personal growth and helpful service are not measured in terms of multitudes of people, nor bigness of institution. The farming neighborhood is rich to repletion with opportunities for personal culture and Christian service—and for what else is life anywhere worth the living?

"BACK TO THE FARM."

The students of the Minnesota School of Agriculture have always taken a lively interest in debating and other literary society work. There are at the present time something like a dozen literary societies maintained by the 800 students of the school. These societies hold weekly meetings during the school year, and once each year each society has a chance to show its talent on the stage before the whole school. Formerly each society was allowed to give a play in chapel each year; but since the societies have grown so numerous, it has been necessary for two of them to combine in giving each play, for the reason that there were not enough available evenings during the year to accommodate all. This kind of work has developed the fact that many of the students have real talent for the stage, and also that some are capable of writing really interesting and worthy plays. One of the members of the present junior class has written two or three plays that have real merit. One of these has been played by a group of school and college students at many of the county fairs and towns throughout the State where the extension department has held short courses and other farmers' meetings. So well have this play and the players been received, that the cast is in constant demand, and has been obliged to appear at some place nearly every Saturday evening during the year.

The play is called "Back to the Farm," and is a three-act drama intended to show the advantage of scientific farming over the old-fashioned rule-of-thumb methods. The hero of the play is a young farmer's son who believes that the farm might be made to pay if it could be managed according to modern methods. He does not receive any encouragement from his father, who is satisfied that he knows about all that needs to be known about farming. The young man finally decides that he will go where he can get an agricultural education. This he decides to do after an interview with the heroine of the story, a young lady from the city who is teaching the district school. In this interview she tells the hero that she could not endure the thought of being a farmer's wife because of the drudgery

The hero goes to an agricultural college, where he works his way and saves a little above expenses by work during vacations. During the years he is away from home the farm is constantly running down and the holder of the mortgage threatens to foreclose. The mother finally hunts up the son and begs him to come back to the farm. This he gladly does, for he thinks he sees a chance for working out the theories he has learned and making the old farm "the best in the State." He takes charge of the farm, borrows a little capital of a man who has faith in modern farm methods, and proceeds to put his theories into practice.

The third act shows the farm after two or three years of good management. The dairy herd has been improved by weeding out the undesirable cows and introducing new blood. The whole farm has been improved and made profitable by a system of rotation of crops, and the house made more comfortable and convenient by modern improvements. In the meantime the heroine has taken a course in domestic science at college and is teaching her specialty in a neighboring consolidated high school. The hero seems to have no particular trouble in convincing her that life on a modern farm may be made very enjoyable, and she agrees to join the partnership.

The necessary touch of humor to enliven the play is furnished by a young Swedish hired man and a maid of the same nationality who have some difficulty in absorbing enough knowledge of germs and other mysterious matters to enable them to understand the reasons for care in following sanitary rules. The father in the third act takes great pleasure in telling an old crony neighbor how prosperous the farm has become under the new order of things, and he gives the young man so much credit that the audience is quite willing to forgive the too frequent use of the word "we."

J. M. DREW.

Woman and the Home

From Day to Day

The Mother-look.

You take the finest woman with the roses in her cheeks,
An' all th' birds a singin' in her voice each time she speaks;
Her hair all black an' gleamin', or a glowin' mass o' gold—
An' still th' tale o' beauty isn't more th'n half way told.
There ain't a word that tells it; all description it defies—
Th' motherlook that lingers in a happy woman's eyes.

A woman's eyes will sparkle in her innocence an' fun,
Or snap a warnin' message to the ones she wants to shun.
In pleasure or in anger there is always handsomeness,
But still there is a beauty that was surely made to bless—
A beauty that grows sweeter an' that all but glorifies—
The motherlook that sometimes comes into a woman's eyes.

It ain't a smile exactly—yet it's brimmin' full o' joy,
An' meltin' into sunshine when she bends above her boy
Or girl when it's sleepin' with its dreams told in its face;
She smooths its hair an' pets it as she lifts it to its place.
It leads all the expressions, whether grave or gay or wise—
Th' motherlook that glimmers in a lovin' woman's eyes.

There ain't a picture of it. If there was they'd have to paint
A picture of a woman mostly angel an' some saint,
An' make it still be human—an' they'd have to blend th' whole—
There ain't a picture of it, for no one can paint a soul.
No one can paint the glory comin' straight from paradise—
Th' motherlook that lingers in a happy woman's eyes.

—W. D. Nesbit in The Chicago Tribune.

Thawing Out the Bit.

Women's work is frequently done in the background, unobserved and unrewarded; yet it is of the character which keeps the world sane and good natured.

THAWING THE BIT.

This picture shows how one woman helps take care of the live stock. Many a hurried farmer on a frosty morning forgets how the horse must feel when the frosty bit is jerked into his mouth without warning. The farmer doesn't mean to be cruel, or to injure the horse, but he is in a hurry, and does not stop to realize what effect this frozen steel will have upon the tongue of the horse. The woman of the household never would do that, and the one here shown makes sure that Old Gray or Charlie doesn't go through the Winter with a frosted tongue. She either has the bridle brought into the house over night, or else she gets hold of it before the men folks harness up, and pours a little hot water over the bit. This takes the frost out and saves a sore and burning mouth. Women often think of these little things, where the comfort of the live stock is concerned, and a little care of this sort just at the right time may make all the difference between profit and loss in the service of the horse.

The Barnyard Trolley.

The little picture shown herewith is sent us by Mr. Horace Markley of New Jersey. It represents a barn trolley, which saves many a step or aching back. The wire is hung between the barnyard and the kitchen door, with a little trolley or runner, and a hook fastened below it. As seen in the picture, the woman hangs the loaded pail of kitchen leavings or of warm feed, and away it goes rolling down

THE BARNYARD TROLLEY.

to the barnyard to be cared for by the men folks. By an adjustment on the post at each end of the line this trolley may be made to work both ways, so that the empty pail may be sent rolling back or filled with something to go to the house, and thus returned loaded. At any rate, this device of Mr. Markley's is a good thing, and an excellent way of saving many useless steps, and much use of muscle for the women folks in the kitchen. It is a homemade device too, which any ingenious man could put up, with a light expense for wire, trolley and hook. It is much better for the women to hook her pail on to this trolley, and see it travel off to the barn, than for her to carry it along herself, or spend time in trying to get the men folks to do it. They will take care of it at the other end of the line, but they frequently forget it at the kitchen end.

THE Chinese have begun to eat ice cream as a regular food and the demand for American freezers is enormous.

*

The Virginia "Farmer's Wife" on page 83 says that she moved heaven and earth to obtain a convenient kitchen. This is no figure of speech. Thousands of farmer's wives would know that Heaven had moved far in their direction if they had such a kitchen. They will have to move many "things of earth" animate and inanimate before they reach their desire. This idea of "efficiency" is working booth indoors and out. Here is one of our men correspondents proposing to put the price of the least useful tools in household fixtures!

*

A WOMAN 81 years old is said to have gone on horseback to attend an extension school in Ohio. The roads were too bad to permit carriage travel. This woman had kept house all her life, but went to see how housekeeping could be taught at a school like reading or arithmetic. Another Ohio report is that a father and his son are studying together at the Ohio Agricultural College. We told last year of a New York man who went to college with his boy. This man wanted to be a friend and companion of his son as long as possible, so when the boy was old enough to enter college the man went along too, entering the same classes and working out the same problems. Both son and father were the better for it.

*

IT is often suggested that a coöperative laundry could be started at the local creamery or cheese factory. The dirty clothes are to be brought to the laundry, washed and ironed and sent back. Steam from the creamery boiler could be used for the laundry. This is a good thing in theory, but it is seldom seen in practice. In hunting for the reason, we are told seven times out of 10 that the men folks say there would be no money in it. The milk carried to the creamery gives a profit in money. The laundry would not mean an income but more or less expense. If the women continue to do the washing this expense will be saved! Now then, we would like to have the women's side of it. Is that argument strong enough in your neighborhood to settle it?

*

THERE is a good story of a helpful man who wrote an article telling how he helped his wife in the kitchen. He kept the wood box filled, brought in coal, churned and helped at the washing, and did a dozen other things to help his wife. This man told the story, and it was printed without his name. His daughter read it and thought it a very fine statement of what a man ought to do. She took pains to give this opinion to a young man who was beginning to call quite frequently. Then this girl learned that father was the man described in the article. That seemed to take the romance out of it, for it did not seem so remarkable that plain and patient father should be glorified for doing the things which seemed so natural for him to do! Nobody looks upon father as much of a hero. When he is good natured and willing to help in the house he rarely gets full credit for it.

*

So far as we can remember of all the thousands of questions we have asked our readers only three have been given up. One is how women farmers can get the silage out of a tall silo. The question was asked by a woman in Illinois. She is 60 years old, and has held her family together on a little farm by feeding stock. Her boy wants her to build a silo, but as she wrote: "In my mind's eye I see myself 40 feet in the air, digging out silage." Here was a question apparently for the suffragists who show us that there are women mayors, sheriffs, jury "men" and police women. Is the tall silo reserved for man alone? Will not some women farmers give their experience?

*

ALL sorts of stories are told of the sacrifices mothers will make to educate their children. Here is a new one. A widow in Kansas City, Mo., offered to pawn her wedding ring and this is what she told the pawnbroker:

"My husband died two years ago. My only son wants to complete his education at the University of Illinois. He has been working since school let out and has saved $100. I want to leave my ring here and give him the money to go to school. If I could get $125 on my wedding ring he will be able to go back to college." The ring brought the $125. That boy's education ought to carry a blessing with it.

*

IT is said that a woman who is a grandmother, has entered the freshman class of Washington University. She is taking a course in English, studying composition and the art of expression. Why should not a grandmother take advantage of a college course as well as her granddaughter? Washington University is the place where a novel scheme was tried for getting the young men to work at pulling weeds. The lawn was filled with weeds, and in order to get them out the college authorities started a voting contest for the most popular girl students in the college. The only way to vote was to dig weeds on the lawn, each weed representing a ballot. Thus the most popular girl was the one who had the greatest number of weeds dug out of that lawn and voted for her. It is said that many a young man who would not have exerted himself under any other conditions, made a tremendous record at weed digging.

*

WITH medical inspection of pupils in the country schools New York is far removed from Afghanistan in medical treatment. In a book by J. A. Gray who was medical adviser to the Amir we are told:

The tooth extracting of the village is usually intrusted to the village blacksmith, who has a ponderous pair of forceps, a foot and a half to two feet long, hung up in his shop for the purpose. When an Afghan comes to negotiate about the price of an eligible girl for marrying to his son, one of the first questions asked is, "Has she had the smallpox?" and if not, either the settlement may be postponed until she is older or else some deduction is made for her possible disfigurement if attacked by the disease. Many times fathers have brought their daughters to the hospital with the scars left by smallpox in their face, begging me to remove them, not so much for the sake of the patient as because the market value of the daughter will be so much enhanced thereby."

*

IT would seem as if Miss Ethel Vanderwilt, of Solomon, Kansas, ought to be a wise woman. She is. She won a gold medal worth $100 in an agricultural essay contest. She competed with young men in agricultural colleges all over the country. This girl did not depend upon the name of her home town for her supply of wisdom. She spent four years studying scientific farming, and is now employed at the State Experiment Station. It is said that Miss Vanderwilt can go into the stock ring and judge stock as well as any young man in her class. Here in New York City the young man of only a crage attainments, coming to find a job, finds himself in competition with women and girls, who are as a rule more reliable, neater, and more accurate than the average man. It would seem too that scientific education is giving the new woman a chance to make the educated men step lively in their chosen field.

*

THE writer once took part in a debate, with the following topic for discussion: "Resolved, that the dishrag is a greater agent of civilization than the broom." The dishrag won. But now comes the College of Agriculture of Ohio, taking up the dishrag and describing its dangers. It seems that the dirty dishrag breeds disease, as it distributes germs from one plate to another. The sanitary dishrag is the proper thing, and more attention should be paid to it than to almost any other household necessity. The cloth should be washed in hot soapy water, hung in the sun to dry, and boiled thoroughly twice a week. We would amend this by having it boiled every day, as this takes but little time, and is a sure precaution. There is one particular germ which causes milk to become sticky or slimy. We have had a number of cases where farmers were absolutely unable to learn how this germ ever got into their milk. They boiled and sunned their utensils thoroughly, only to learn finally that the germ was carried in the innocent-looking dishrag, and conveyed to the pans and pails through the washing. When the dishrag was boiled, this germ disappeared. Evidently no one can win the debate in favor of the dishrag in practical work, without getting it into hot water.

*

"GOOD HOUSEKEEPERS."—At a "mother's meeting" several women talked long and learnedly about the proper training of children. One woman never had any children of her own, nor had she ever raised any. Yet she had a perfect system, and was full of advice. Another maiden lady, a school teacher, also told just how it should be done. In the discussion a gentle little woman on a back seat ventured to make a suggestion which was not according to the rule:

"What, may I ask, do you know about the science of children," asked the president.

"Very little," was the humble answer. "I have only raised six of my own, but I cannot give you any rules for doing it."

The best cook in town was a woman of 60 who in her inconvenient kitchen turned out the most wonderful cake and doughnuts and pies. The young woman from the domestic economy class took pencil and paper and went to get the recipe.

"Now, Aunt Mary, tell me just how you make those doughnuts and I will write it down."

"Well," said Aunt Mary, "I take a handful of flour, a pinch of salt, a lump of butter and as much milk and sugar as I think I need and just make them."

You see mother and Aunt Mary could not tell others how to raise great, healthy boys and girls, or how to make doughnuts and pies by rule. They put their personality into their work, and that gave them almost a patent. If the average man could have his future wife trained by one of these natural housekeepers, or a college of domestic economy, which would he choose?

First Christmas Tree by Parcel Post.

The picture is of a Christmas tree my wife and I sent my younger cousin on Long Island by way of parcel post, all trimmed and finished as picture shows. The tree measured 32 inches in height, with a spread of branches 20 inches in diameter. After trimming we carefully drew the branches up and tied them the same as you would fruit trees for shipment, and packed in box. After packing the bundle measured length, 33 inches, girth 37 inches, weight five pounds, cost insured 14 cents parcel post. It was received in excellent condition. We sent it partly as an experiment and partly as a lark, but since we sent it the thought has occurred to us how happy it would have made some of the poor children of the city, who hardly know what a Christmas tree is, to receive one like it on Christmas morning WM. A. CASE.

CHRISTMAS TREE SENT BY PARCEL POST.

Farm Manufactured Food.

MEAT PRODUCTS.—I have had abundant opportunity to observe the many things sold and called for every day in the average grocery, that could be manufactured or produced on the average farm. First come the meats. Sugar-cured or otherwise, hams and bacon would find a ready sale. I know of no farmer making a business of this for our market, but there is a man located about eight miles from Ft. Wayne, who makes a business of country sausage, and twice a week he brings a wagonload of sausage and lard to town, which sells to the grocers at about 15 cents for the sausage and 10 to 12 for the lard. Sometimes the demand for sausage is so great that he cuts up the hams and tenderloin into sausage. This sausage is all put up in the casings, and these are coiled in bushel and half-bushel baskets. The lard is put up in 50-pound cans with his name on them. These cans when empty are replaced with full cans. The sausage retails for 20 cents and the lard for 15; 10-pound lard pails could be used for private or family trade.

BUTTERMILK.—One of the best sellers I know of is fresh buttermilk. The average city never gets enough; it can be used for so many things in cooking, and as a beverage is unexcelled. Buttermilk naturally calls to mind cottage cheese. Any woman who could make good cottage cheese would find a number of people who would take a supply each week or twice a week. This could be put up in one and two-quart butter crocks and these exchanged when empty for others.

CANDIES.—Home-made candies would find a ready sale over the doctored, adulterated glucose kinds now sold. I would suggest a person making a specialty of some one kind, preferably one of the old-fashioned kinds, like butterscotch, molasses taffy or peanut candy. Where anything is made that must be sold in small quantities, an arrangement with some storekeeper to handle the goods on commission should be made, even to paying for a few lines of advertising inserted in his regular "ad."

A WOMAN'S EXCHANGE.—One merchant here who is in the tea and coffee business has a department called "The Ladies' Exchange," which occupies one section of his store. It costs $1 for membership and 10 per cent. commission on sales. Regular members of this exchange make certain things. Formerly this exchange sold anything from embroidery to doughnuts, but now it handles baked goods almost exclusively. One of my friends makes a white layer cake with frosting, nothing else. She has developed quite a business, buys eggs by the case, sugar by the 100 pounds, and other supplies in proportion. I asked her what she did with the yolks of the eggs. "Oh! give them to the neighbors." Now suppose some one making a yellow cake or something that would use those yolks, could coöperate with her; think of the saving! These cakes sell for $1 each, 50 cents for a half, and this woman has regular customers for these cakes, besides many extra orders. She supports her home (her husband being in poor health) with her baking. All the jams, jellies, preserves, pickles, etc., would find some one clamoring for them, but in all this remember you must have a clean, neat, attractive package, and a bright tasty label would enhance the chance of sale. We found that we could put up a nine-ounce glass of jelly for five cents. Many of the stores retail a seven-ounce glass for 10 cents, and it isn't to be compared with a good homemade product. Dill pickles retail 15 cents per dozen, others one cent each. Another thing that is in demand is apple butter. I talked with one woman who sold all she could make at $1 per gallon. Homemade sauerkraut is retailed in large quantities every year. This year it sells for 10 cents per quart, cabbage being scarce, but usually at eight cents per quart. The stores sell this in ordinary oyster pails, pints and quarts.

HUGH HARTMAN.

"I Will Trust You Gladly Wherever You Live" "I believe in every man who earns a living. I am for the average home lover—the man who wants home pleasures but hasn't a whole lot of money to spare all at once. My credit plan of buying is for him. I want to get acquainted with all those who desire to make their homes cheerful and comfortable. I can help them get what they want. Thousands are saying, 'Spear helped us to beautify our homes on his liberal credit plan.' I want many more friends like that. Send for my bargain book now and let me explain how I give 'Credit to the Nation.'" Spear, Pittsburgh

Spear's Room-Size Brussels Rug Only $11.95

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards their property and their children. There will be direct answers to actual questions and general statements of law.]

Will for Charitable Purposes.

If I should make my will and leave all my estate to charity except $1 each to my brothers and sisters after all of my just debts are paid, such as doctor bills, nurse bills and funeral expenses, including all grocery bills and any other debt I may have contracted during my sickness, can my brothers and sisters break this will and take all my estate, which they are not entitled to, as they have never done anything for me and never came to see me until the doctor said I would soon die? I have known several cases of this kind, and I am only writing it this way for example.

You may leave any part or all of your estate to charitable uses, and your relatives cannot break your will, provided your will is attested by two credible and disinterested witnesses, and made at least one calendar month before your death, for the laws of Pennsylvania provide that no devise of property may be made for charitable uses by a will executed within one month of the death of the giver.

Married Woman's Property in Cows.

If a woman buys a cow with her own earnings, outside of the home work, can she hold the increase from that cow, or does it belong to the husband and heirs if the husband dies?

You may own in your own right all the cows you pay for out of your separate money, or all the cows which you may have acquired by agreement with your husband. You are not limited to one cow or to any other number. You would naturally own the increase also, but if your cow was fed on your husband's feed you should make some agreement with him as to the calves. If he would feed the cow for all the bull calves, you to have the heifers, that is a lawful and enforceable agreement, and you would then own all the heifer calves as against him or his heirs or all the world.

Woman's Right to Property.

I would like to know if I have a legal right to my home. My mother died in 1900, leaving a house and lot with a mortgage of $750 on it. There were two daughters, myself and Mrs. S. Mrs. S. had died, and left two sons over 21 years of age and married. They and their wives signed deeds to me for a consideration, and I hold the same now. There were no personal debts, and it never went through the surrogate's court. If I should die without a will would my property go to my husband and daughter? E. J. L.

If you have not already done so, it would be well to have the deed from your sister's sons and their wives to you recorded and then there could be no question of your title to this property. If you should die without a will your real property would go as follows: First, your husband would have a life interest in it, and then it would all go to the daughter in fee. If you own real property, it would be well for you to make a will in a short form, such as appeared in this paper some time ago.

Rights of Guardian.

What is the legal difference between the rights and duties of a parent, and of a guardian? Suppose a woman is appointed for a child, with no estate to pay for it. What actual control or right does the guardian have over the child as compared with her own son or daughter, and is she obliged to protect and care for the child as a guardian? What right has she, if any, to the labor of the child until it becomes of age?

There is no practical difference between the rights and duties of a parent and those of a general guardian who has charge of both the person and the estate of an infant. In the case given where the guardian of a child is appointed without any estate out of which to pay for the care and tuition of the child, the guardian may do one of two things: care for and support the child out of the guardian's own estate, or the guardian may with the approval of the court or officer which appointed the guardian, send the child to an incorporated orphan asylum. The guardian is not, of course, bound to pay for the care of the ward out of the guardian's funds. The guardian exerts the same control over the ward as she would over her own child, and she is obliged to protect and care for the ward practically the same as for one of her own children. She has, however, not the right to the fruits of the labor of the child except that where the child has no estate of its own, its labor may be used toward defraying the expenses of its support.

It is well to note that a married woman is a joint guardian of her children with her husband with equal powers, rights and duties in regard to them as has the husband, and the surviving parent may, upon the death of the other, by a deed or by a will duly executed, appoint as guardian for an infant child during its minority or for any less time, any person or persons they deem suitable, always having in mind that the paramount issue is the welfare of the child, and, as above stated, the guardian so appointed, or one appointed by the court has practically the same rights, duties and liabilities as a parent.

The Youngest Grange Lecturer.

Miss Winnifred Whitcomb, whose picture is shown below, is said to be the

THE YOUNGEST GRANGE LECTURER.

youngest Grange lecturer in the United States. She was installed as lecturer of Everett Grange in Massachusetts when only 15 years of age; and what is better, did the work effectively. The office

A CHAMPION CORN GROWER.

of lecturer is really the most difficult of any in the Grange. It is the duty of the lecturer to think out and provide programs which must be educational as well as entertaining. It is no small job in a country neighborhood to provide these programs for a full year, so as to keep up interest in the organization. The Grange is not only a fraternal organization, but it is educational as well, and that is why it has always had such a strong hold upon country people. The efficient lecturers who spend so much time and thought in preparing good programs, are largely responsible for the fact that the true Subordinate Grange in this country represents the very cream of our rural people. The National Grange may be subject to fair criticism, but the Subordinate Grange back in the country towns and among the hills, is the strong part of the organization, and has had much to do in the development of rural life. The lecturers of these local Granges who in their quiet way supervise or direct the thought of the members, rarely receive proper credit, yet to them is largely due the great strength of the order. Perhaps we may be able to print later a picture of the oldest lecturer in the country. This month, however, it is the youngest one, Miss Winnifred Whitcomb.

A Girl Corn Grower.

The picture printed below shows the 11-year-old girl of Mercer County, Pennsylvania, who won first prize in a corn contest. Our space is too short this week to tell all her story. Later, in the corn-growing season, we shall tell how her crop was grown. Miss Aleen Fell belongs to a family which in its turn has belonged to the soil for at least 200 years. Her father had no boys to enter this contest, and so Miss Aleen entered under her nickname of "Pete." She grew 98.65 bushels of shelled corn on one acre, doing practically all the work herself, except the plowing. She ought to be able to raise good corn, if there is anything in pedigree, for her grandparents moved into the county where she lives in 1788. About their first duty was to clear off a piece of land and plant corn, and every year since then corn planting has been a similar duty. This girl performed that inherited duty so well that she won in competition with 80 boys, and the citizens of her home town put up the money and sent her to the State College for the entire "Farmers' Week," where she made a speech to 600 farmers, and told them how to raise a prize corn crop. She also won $10 as a prize for the best 10 ears of corn, and received a letter from Justice Fell of the Supreme Court of Pennsylvania. The story of how this girl came into the contest as father's boy and won this prize, is one of the best things brought out in agricultural literature this year. We would much rather print, as we do, the picture of this plucky farmer's girl, than to print pictures of a dozen society women, or people who so frequently get into the public eye without deserving a place there.

THIS WASHER MUST PAY FOR ITSELF

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse. But, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right, but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse wasn't "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse although I wanted it badly. Now this set me thinking.

You see, I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way.

So, thought I, it is only fair enough to let people try my Washing Machines for a month before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that, without wearing out the clothes.

Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman and it don't wear the clothes, fray the edges nor break buttons the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight, too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months, in wear and tear on the clothes alone. And then it will save 50 cents to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in 6 minutes.

Address me this way—H. L. Barker, 1201 Court Street, Binghamton, N. Y. If you live in Canada, address 1900 Washer Co., 357 Yonge St., Toronto, Ont.

BETWEEN SEASONS ACCESSORIES

Show windows and shop counters are already gay with new Spring furbelows. Such an alluring array as there is! It positively makes one feel shabby to behold them, for even the best of Winter wardrobes have a way of appearing dingy at this between season, when it is still too early to discard old plumage for new. Forehanded women are, therefore, refurnishing their costumes and giving them the smart little touches that will make them appear up-to-date these last Winter days.

First of all the very newest thing is the cutaway jacket. It is not a difficult matter to perform the feat of shortening the front of an old one, thus making it conform to the new style. The very latest cut is that which is long behind and extremely short in front, extending just below the bust. With this idea was born the waistcoat girdle as an accompanying accessory. I mentioned this transforming waistcoat girdle last month, but in this paper I am able to illustrate the very newest thing, with a hope that it may serve as a suggestion for numerous variations. Of course it may be worn with any jacket, but to appear really smart it will be wise to abbreviate the length of your coat in front. All that is necessary is a pair of shears and a little confidence in yourself. Perhaps it would be better to mark the front of the coat with white chalk, just where you wish to make it a "cutaway," then try it on before the shears have done their work. It will be easier to change your mind about the length before you have cut into the coat than afterwards. The fronts may be left loose, or they may be gathered blouse-fashion. If the latter, a belt will be required. If the former, the fronts should be lined with silk or satin. I know one clever girl who always makes the most of materials at hand, who lined the loose fronts of her box coat with a flowered rose silk she emancipated from an old pair of rose velour portieres. She then proceeded to make just such a waistcoat girdle as I have pictured from a piece of the plain rose velour curtain, the latter having seen its best days. Another section was used to make a handbag, mention of which will be made later.

No pattern is required for the girdle, as it is cut even all around with the exception of a slight curve in front. Fold a seven-inch width of material together, allowing about five inches longer than the actual waist size, for the lapping which simulates the vest. In any event, the girdle must be loose when finished, otherwise it will wrinkle. After the girdle is cut, pass it around the waist, and pin the ends just as you wish the diagonal slashing to appear when it is finished. Then cut, and proceed to line and stitch tailor fashion. In fact, it will be better to stitch the girdle before lining, as the latter should be blind-stitched by hand.

Chamois, suede, plain and figured velour or a piece of broadcloth to match the skirt with which it is to be worn may be used for the waistcoat girdle. It may be boned before lining or left to wear crush fashion. Figured cotton eponge, with a sprawling rose, or any other floral design, will make a smart waistcoat girdle, and give a little "Springy" touch to a suit. These eponges are inexpensive, and are quite the newest thing in fabrics. L.. season we called eponge "ratine," but the new material is practically the same coarse, Turkish towelling weave with the exception that formal effects and Bulgarian colorings are seen on the plain backgrounds. These are exceptionally adapted to waistcoats, and cuffs and collars for wear with a tailored suit, as they launder and may be kept immaculate.

So long as the fingers and hand-seams of long suede and kid gloves persist in wearing out before the arm sections, just so long will uses be contrived for the pieces of soft smooth suede, and delicately tinted kid that only a reckless needlewoman would ever dream of throwing away. Perhaps they will be just the thing to utilize in fashioning a waistcoat girdle (as they are easily seamed on the machine) or one of the new bags for which an old frame may be used.

From the uppers of a pair of brown suede gloves, with a couple of yards of gold braid a half-inch wide, a fascinating hand-bag was made. The two pieces of suede were opened along the seam with as little sacrifice of material as possible, and were then laid together and trimmed exactly the same size, the upper edges being left straight, and the lower ones curved to a middle point. A lining of gold satin was cut a trifle larger, even when seams were allowed for; possibly a quarter of an inch on all sides except the top, where plenty for turning in and finishing was allowed. The lining was made first, then the two sections of suede were laid on it and stitched neatly down, without the edges being turned in at all. This left the little space between them, all around the sides and bottom, open, showing the raw seam of the lining. Over this was then stitched the gold braid, joining the two suede sections. The upper ends of the braid were turned down and were covered by the lining satin, which was turned in at the top and stitched to the suede just below a row of eyelets, through which ran a heavy gold silk cord, with brown and gold tassels. The gold braid would have worn too harshly against the suede. Of a narrower gold braid a handle was plaited, each end of which was attached to the center of a suede panel. The ends of the braid were sufficiently long to be curved and sewed on to the suede in a pattern resembling the Celtic interwoven designs. Another combination well worth trying would be black suede with violet moire for lining, using a black cord and tassel for carrying and finishing.

Simple but Frenchy mode of trimming a last year's straw hat to wear the "between season."

There is no article of apparel which begins to look quite so passé as the hat one has been wearing every day for the past few months. The woman who would discard her Winter chapeau and freshen up her last year's shape for wear until she is ready to replace it with a new Spring creation, may do so with excellent results. Remove the trimming, if you have not already done so, brush the straw until every particle of dust has disappeared, then give it a coat of shoe polish of the liquid variety. Set in the sunshine to dry. Almost any scrap-bag has a roll of black moire, satin or velvet ribbon which may be used in some such form of trimming as that pictured, or even ordinary velvet, cut on the bias, will answer every purpose. First, there should be a straight fold across the front of the crown with a "fan" trimming on either side well toward the back. To make such a rosette, side-plait the ribbon or velvet, one plait on top of the other until it has the required fulness; then secure the entire mass of plaits at one edge with coarse thread. When there is no danger of the plaits falling apart, they will drop naturally into a flare as pictured, fan-fashioned. Each end of the ribbon fold may be secured to the rosette on either side, leaving the puffy center free. It is a simple, Frenchy mode, and easy of achievement.

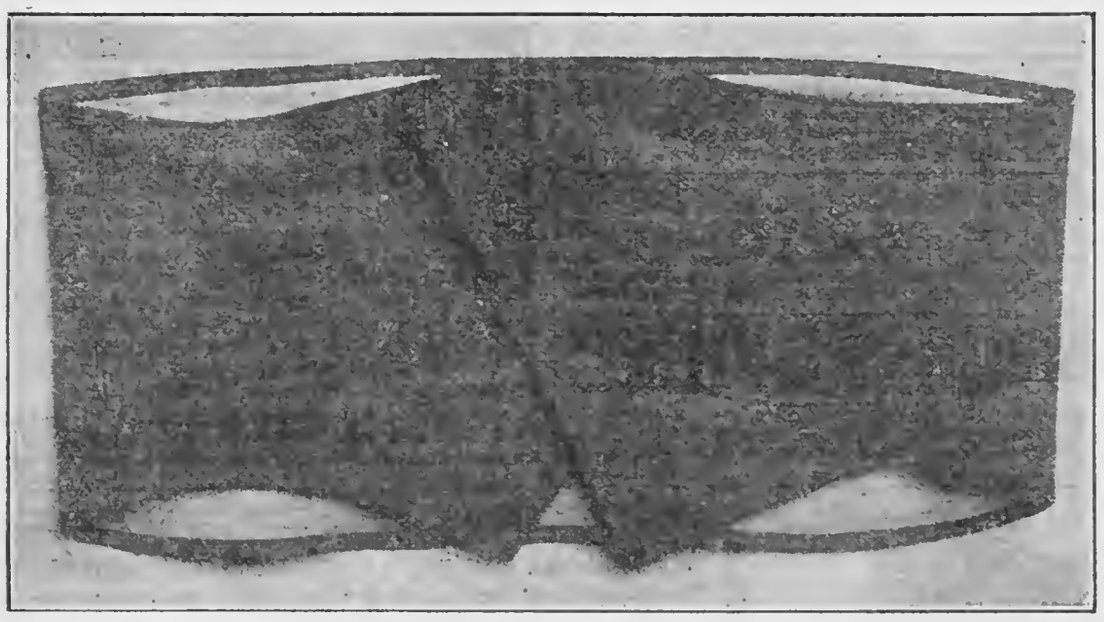
Either a soft lace collar with a frilled edge of net, or one of the high-at-the-back crepe de chine or crepe meteor collars with the wide flare hem-stitched, may be worn with such a costume. The newest of these Medici collars rolls in graduated points over a simulated vest. Speaking of collars, I saw a costume on Fifth Avenue the other day the most noticeable feature of which was the high upstanding starched collar. Not the old-fashioned circumspect stand-up kind, but a picturesque flaring accessory with high points in front, such as our great-great-grandfathers used to wear, with a skirt of linen that lies flat on the outside of the bodice. A black satin fold passes around the neck to disguise the joining of the collar and its linen skirt. The collars look exactly as I have described them, and any woman who wishes to cut one after her own fancy is safe in doing so. The more picturesque and flaring it is fashioned, the better style it will be. It requires a half yard of linen to make a collar and its "skirt."

And remember, while you have your hat box of materials out to make one of the little boutonnieres of the different flowers at hand, to add an attractive touch of color to your costume—a pink rose, a gardenia, a few violets, a spray of lily-of-the-valley, and forget-me-nots make as charming a boutonniere as one would wish for, and which to purchase would cost a small fortune.

If you have a party gown you wish to refurnish, why not make a minaret girdle? They cost $4 in the shops, and may be fashioned at home for but little, and perhaps at no expense. There is a wide band of material at the waist—satin or silk, supporting a quaint flounce of the same fabric. In the front is a "tablier" of satin finished with a silk tassel. This can be worn with any skirt and has the effect of a tunic.

Should you wish a pretty scarf to wear over your shoulders for an evening affair, there is nothing more attractive than black or white tulle. A two-yard length will be required. As it is wide, one width is sufficient. Turn a hem in each end and gather with silk thread. Draw in a knot and secure with a silk tassel. The latter cost but 10 or 15 cents apiece, and they come with a little hooded top that fits in the "frill" of the tulle. There is an elegance about tulle that sets off a costume as nothing else can do.

LOUISE E. DEW.



Waistcoat girdle made from the uppers of an old pair of evening gloves. Lined with white satin.

"VOTES FOR WOMEN."

I am glad you have taken up the "votes for women" subject, and as usual, in a perfectly fair way. It is very true that many, perhaps a majority, of our eastern farmers' wives do not care for the ballot, because they have given but little thought to the matter. Those of us who have tried to do something along moral reform lines have found that education without legislation is slow work. We would like to sit at home election day and let our husbands and brothers "protect" us at the polls, but we see that the odds are against them singlehanded, and so, like good wives and sisters, we want the chance to go out and help them. Our brothers need us, not only in the family housekeeping but in the town, State and National housekeeping as well. It works well where it has been tried. Some say it would only double the number of votes without changing results. The brewers and liquor dealers' associations do not seem to think this, as everywhere they are among the bitterest opponents to votes for women. They are wiser and far more experienced in political matters than we and I bow to their judgment and believe the liquor men have reason to fear the women's vote.

HATTIE E. MILLER.

Ever since you started out to get the opinion of the women, in regard to this question, I have wanted to criticise your method, and the wording of your questions. It is not a question of "whether we would vote if we had a chance." It is whether the women of New York State *should have the privilege of voting*, whether they wanted to or not. I for one want to vote; if for no other reason, because I brought a daughter into this world and taught her the duties of citizenship. She is now living in Illinois, having the privileges which I am denied. I never have heard of, or seen anyone through this part of the country who was trying to find out what percent of the women wanted this privilege given to their sex, so how was the result obtained when the conclusion was reached that "only 10 percent of the women wanted equal franchise?" They didn't ask me or any of my neighbors and I can tell you right now, this country is just throbbing with eagerness to cast a mighty ballot, to help right some of the wrongs existing everywhere throughout this broad land. At all the former elections, the op-State counties have been factors to be reckoned with, so don't say again that "only 10 percent of New York State women want to vote," until you hear from little Warren, for there are many hundreds of women who have for many years been anxiously praying, wishing, and working, for this end.

EMMA B. WILKIE.

We have had long experience in learning the sentiments of our readers, and naturally we will follow our own plan in this case. There have been several very long and bitter articles sent us by the anti-suffragists. We cannot print such long documents. It seems a remarkable thing to us that women should indulge in such fierce denunciations as these "antis" do. Their favorite argument seems to be that immoral women in town and city would be most likely to vote and control elections. At the recent registration in Chicago over 153,000 women registered. Our private reports from Western States do not show any such conditions as these "antis" claim. As one on the other side puts it, "Anyway, it is no worse for such women to vote than for the men who profit by them!" What we make out of it thus far is that "votes for women" is at present in the East, largely an industrial movement of city working women. Country women are not yet specially interested so far as we can learn, except here and there where some strong workers are to be found. The Democrats in Congress have decided to consider this a *State* question. This means that under the present Administration there is not likely to be any National legislation on the subject.

Our Suffragette.

Last Spring, when we began feeding our new calf, she was so very militant that we named her for that leader of militantism in England, who has so recently visited our own land.

It was not long before our two-year-old daughter was entertaining all visitors by saying: "My bossy—name En'line Pankhurst—say Ma-a-a—Votes for Women!" As the Summer passed she said it more and more seldom, till we supposed it was forgotten. In November we took her home to New England to exhibit her to her grandparents. While waiting in the Canadian Pacific Station in Montreal, the young miss, now 2½, discovered the lovely echo in the waiting room and amused herself for some time by shouting "Oh" and "Ah." Suddenly the room rang with, "Votes for Women" vociferated with all the force capable from a tiny pair of lungs, till to our embarrassment so many eyes sought our direction that we hastened to the platform thus diverting our young suffragette.

A. G. I.

"THE MAID WAS IN THE GARDEN HANGING OUT THE CLOTHES."

Little Brown Baby.

Little brown baby wif spa'klin' eyes,
Come to yo' pappy an' set on his knee,
What you been doin', suh—makin' san' pies?
Look at dat bib—you's ez dirty ez me.
Look at dat mouf—dat's merlasses, I bet;
Come hyeah, Maria, an' wipe off his han's.
Bees gine to ketch you an' eat you up yit,
Bein' so sticky an' sweet—goodness lan's!

Little brown baby wif spa'klin' eyes,
Who's pappy's darlin' an' who's pappy's chile?
Who is it all de day nevah onces tries
Fu' to be cross, er once loses dat smile?
Whah did you get dem teef? My, you's a scamp!
Whah did dat dimple come f'om in yo' chin?
Pappy do' know you—I b'lieves you's a tramp;
Mammy, dis hyeah's some ol' straggler got in!

Let's th'ow him outen de do' in the san';
We do' want stragglers a-layin' 'roun' hyeah;
Let's gin him 'way to de big buggah-man,
I know he's hidin' erroun' hyeah right neah.
Buggah-man, buggah-man, come in de do',
Hyeah's a bad boy you kin have fu' to eat.
Mammy an' pappy do' want him no mo',
Swaller him down f'om his haid to his feet.

Dah, now, I t'ought dat you'd hug me up close.
Go back, ol' buggah, you sha'n't have dis boy.
He ain't no tramp, ner no straggler, of co'se;
He's pappy's pa'dner, an' playmate, an' joy.
Come to you' pallet now—go to yo' res';
Wisht you could allus know ease an' cleah skies;
Wisht you could stay jes' a chile on my breas'—
Little brown baby wif spa'klin' eyes!

—Paul Laurence Dunbar.

Headquarters for Strawberries and Small Fruit Plants of all kinds. Raspberries, Blackberries, Currants, Gooseberries, Grapes, Fruit Trees, Roses, Shrubs, Eggs for Hatching, Crates, Baskets. Catalog.
L. J. Farmer, Box 420, Pulaski, N.Y.

Get at the root of things

when buying berry and other small fruit plants. Heavy top growth is actually a disadvantage unless the plant has sufficient roots to sustain it. Our bigger, better roots—due to unexcelled growing conditions — assure bigger yield of bigger berries. Get our New Catalog—lists only the better varieties, gives full cultural helps. No novelties that have failed to prove their merit under our severe tests are included. This dependable Small-Fruit Catalog is free—contains berries of all kinds, grapes, currants and garden roots. Write for it today.
LESTER LOVETT, Diamond State Nurseries, 32 1st Av., Milford, Del.

My! What Large, Luscious Strawberries
That's what they'll exclaim and then quickly buy—at a good price—all such delicious berries you can produce. It pays to raise large, beautiful true-to-name standard varieties of berries such as
ALLEN'S Strawberry Plants Yield So Heavily
Your success is assured if you start right with ALLEN'S hardy, prolific, correctly grown berry plants. All the early and late strains of standard varieties for every soil and climate requirement. Over 120 acres devoted to strawberry culture alone at the ALLEN Nurseries, 29 years successful experience growing berry plants of the best quality.
Shipments Prompt and Guaranteed in Good Condition
ALLEN'S plants are carefully selected and packed for shipment. They are **fresh** and guaranteed **true-to-name.**
Send for ALLEN'S 1914 Book of Berries
It's full of valuable information to fruit growers. Lists and describes Allen's complete line of Strawberries, Raspberries, Blackberries, Currants, Grapes, Asparagus, etc. Tells how to grow small fruit profitably. A copy will be sent FREE. Write today.
W. F. ALLEN, 72 Market Street, Salisbury, Md.

Grow This Berry for big profits and sure yields. It is hardy and wonderfully productive, coal black and very large, almost as thick through as long. In luscious flavor it surpasses by far all others I have ever grown. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other fungus disease, and I believe it immune to them.

The "JOY" BLACKBERRY

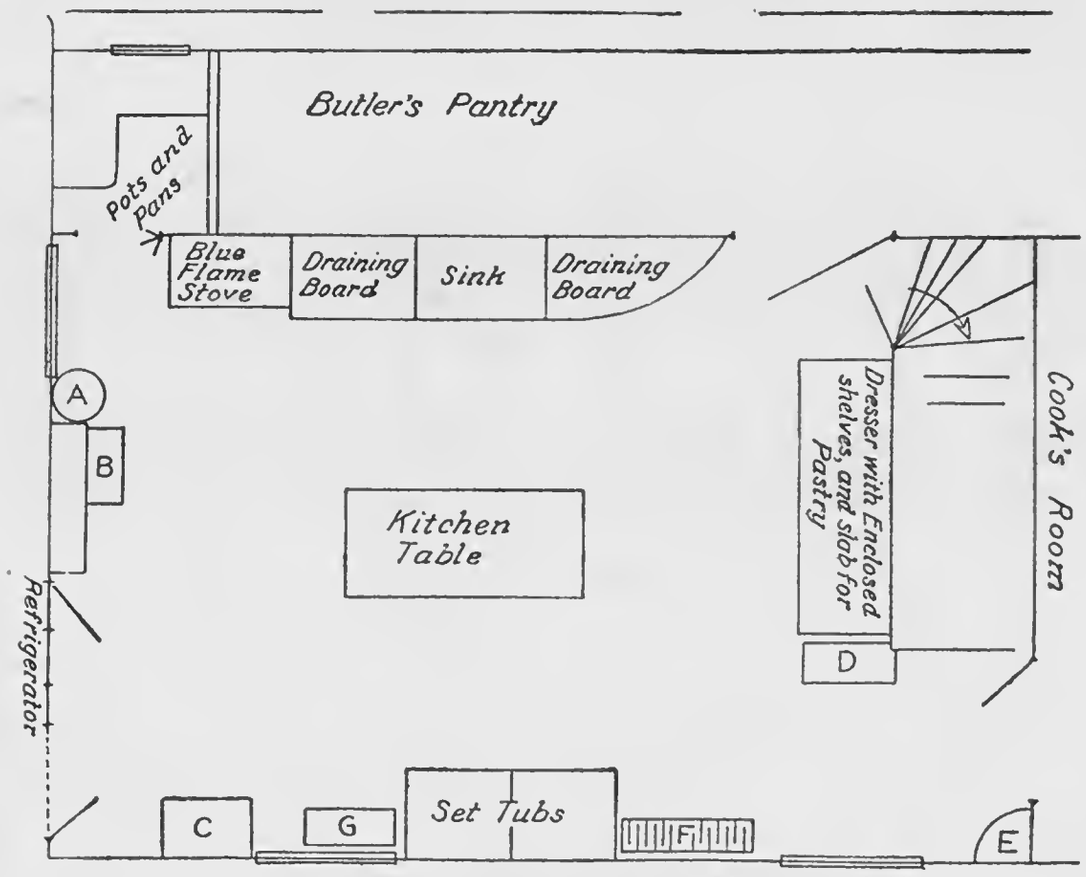
brings joy to all who grow, sell or eat it. It is immensely profitable to the market grower, and "a joy forever" to the amateur gardener. The canes are of iron-clad hardihood, need no staking, and are literally loaded with fruit every year. I know this berry thoroughly and willingly stake my reputation upon it. Illustrated catalog replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed, prices low.
LOVETT J. T. LOVETT Box 162 LITTLE SILVER, N. J.

A Model Virginia Kitchen.

The description of a farm kitchen on page 87 made me wonder whether any one would be interested in what my friends jokingly call "a model kitchen?" We live on a farm in the Virginia mountains, and when we bought the place, the farmhouse was provided with a kitchen that was a triumph of inconvenience. It was everything a kitchen should not be, down a flight of stairs from the dining room, dark, cold in Winter and hot in Summer, with very little storage room, and that so scattered that one walked miles getting one's materials together. I stood it for two years, and then built a kitchen.

It is on the same floor with the dining room, from which it is separated by a long narrow butler's pantry, provided with a pantry sink and shelves for the dining-room dishes behind sliding glass doors. The kitchen is 18x11 feet, with an additional jog that goes to the door of the cook's room. The set tubs are covered so that when not in use they can be used as a table. The lower part of the dresser is divided into two compartments. In one is the flour barrel on a contrivance which allows it to swing in and out; in the other, I hope some day to have a little dumb waiter for carrying fruit jars and so on down to the jelly room. Over the sink is a cabinet with glass doors and shelves for the spices and all the odds and ends that are constantly needed in cooking, such as baking powder, starch, soda, cream of tartar, measuring cups and so on. The radiator really is not necessary, but we did not know surely and thought it wisest to put it in, but now we know that the blue flame oven and burners are ample for keeping a kitchen warm in this climate. We have hot and cold water in the sink, and no dirty coal to carry in and no dirty ashes to carry out, so that compared to the old kitchen, it is heaven to get dinner, and all the work can be done with half the strength, especially as I now have a patent dishwasher.

FARMER'S WIFE.



A MODEL VIRGINIA FARM KITCHEN.

Just Honest Fresh Air.

I have been doing a good deal of thinking lately, as well as too long ago to be called lately, about the lack of fresh air, and the total disregard of the necessity of such a thing as ventilation in most of our farmhouses. My life as a district school teacher before my marriage gave me an intimate knowledge of many farm homes which I could have obtained in no other way. I have one case in mind. One of my pupils, a little girl in a certain family, was very thin and white, positively starved looking, but I knew she was not starving for food in that home. Her mother smilingly replied to my inquiry: "O, Maggie will be all right when it comes Spring so she can get out of doors. She always looks just like that in the Winter."

Soon after Maggie was taken sick. I found her in a little seven by nine bedroom opening from the kitchen. Its one window was muffled in old quilts and blankets tacked firmly down, excluding every possible breath of air or ray of sunlight. I inquired the reason for such precautions. The mother assured me that the wind came in around the window which was old and loose, so badly that Maggie would get "her death of cold" if it were not for the corking and bundling up of the window. No amount of argument would convince her to the contrary, although she admitted that when Summer came and Maggie was out of doors days and slept up in the unfinished chamber nights she was all right. "The others," she added "were just the same when they were small." The others I found were old enough so they were allowed to sleep up there now the year round, which to my mind accounted for the improved state of their health. However Maggie lived and grew up.

NEW USE FOR THE COW.

Later I visited her in her own home. I found two happy-faced, robust youngsters playing in the snow in the door yard, and as I climbed the steps to the veranda I noticed a baby carriage standing in the corner. Later investigations revealed a plump rosy boy of two months, sound asleep with a smile dimpling his little face, such a smile as his mother's babyhood never knew, in her stuffy bedroom with a blanket spread over her face for fear she would take cold. Maggie herself was the picture of health and happiness. The air in her kitchen as well as the rest of her house was pure and sweet. To my inquiring look she answered: "They're not going to die for a breath of air anyhow, and they never have a cold." Last Summer I visited her again, and the children, well the accompanying photograph speaks for itself of their attitude toward life.

Live Stock and Dairy

EXPERT CARE OF DAIRY COWS.

You ask for more in detail about handling my cows, in addition to what appeared on page 232. My cows are all grade Jerseys or Guernseys, mostly the latter now, but a number of them do not seem very good ones, and I hardly understand how they average for the year as well as they do, but it must be because I keep them at it pretty steadily. They are usually dry only from four to six weeks. I feed them grain twice a day, all of the year except when they are dry in the Summer, but I feed a very small amount when pastures are good in early Summer, and I have quite a large pasture, but increase as grass gets short. After corn is in the silo I turn them on the meadow, where they get pretty good grass usually. Perhaps this is not good policy, but part of this land overflows in times of high water, and enriches it, and on the rest I practice a short rotation of crops; corn, oats and clover and Timothy, cutting hay only one year. I do not think much of the oats, as there is not much money in a good crop of them, but I need the straw for bedding, and have to sow something as a nurse crop for the grass seed. Fall being my shortest season for milk I can sacrifice something in order to get butter enough to keep my customers supplied until I have more fresh cows in the Winter.

I have a hired man all of the time, unless it is for a short time that I cannot find one, but I always feed the grain myself, and am around usually to see that the other things are fed right. There are not many milkings in the year but what I am on hand to help and supervise; my cows have water in buckets where they can get it any time they want it, and I am sure that is a great help in producing Winter milk. They nearly always drink after eating; just when it would be very inconvenient to turn them out of doors to get water, and they drink so much less at a time. I get the water from an excellent spring by using 1,500 feet of ¾-inch pipe, with an elevation of about 60 feet, so I have a good pressure to wash buggies, spray the garden, lawn, etc., as the pipe is always full no matter how dry the weather.

I milk at regular hours, run the milk through the separator and feed it to the pigs and calves and sometimes cows while it is warm, using a small gasoline engine at the barn for the separator and grindstone, and another one at the house to operate the churn and washing machine with wringer. I do the heaviest part of the butter-making, but am well assisted by my wife in that as well as many other things. She helps milk occasionally when one of the other milkers is away. We also have an automobile, which helps break the monotony of farm life, and we can see considerable extra country and other things with that, as it is so much quicker and does not sweat and get tired like horses. E. N. RYTHER.

Cattaraugus Co., N. Y.

THE HUMBUG OF THE HEN.

Forty years ago, my father told me to get something "bigger" than a chicken. The reason of this was because at that time the great profits from chickens, or hens, was heralded broadcast as at the present time. On page 162 Mr. Mapes comes forth with a report on "Hens vs. Cows." The comparative report in his case I believe to be true. The product from the cow sold from the farm is sold all over this land at a small loss to the producer. The great profit from the cow is made when the product is sold the second time to the consumer. The particular point I wish to bring out in this report, is the "$4,500 worth of market eggs from 1,800 hens, and $500 more on increase of 800 young birds." I know that a good laying hen will consume eight ounces of food of some kind per day of 24 hours if she can get it. If she cannot get it she will not lay in proportion. If it takes eight ounces of feed per day, how many pounds per year? Answer, 182 pounds; 1,800 hens would consume 327,600 pounds. Now what is the cost of chicken feed where Mr. Mapes buys? At $30 per ton it would cost nearly $4,900 to feed his 1,800 hens one year.

He has an increase of 800 birds. These birds will consume at least two ounces per day for six months. Their bill for feed at $30 per ton will increase the feed bill $270 more, or a total cost for feed $5,170.

The income from each hen is $2.50. If the eggs sold for 60 cents per dozen, they averaged a trifle over four dozen per hen. If 50 cents per dozen they averaged five dozen per hen. If sold for 40 cents per dozen they averaged a little over six dozen per hen. If sold for 30 cents per dozen they averaged a little over eight dozen per hen. If sold for 20 cents per dozen they averaged a little over 12 dozen per hen.

I am a dairyman. If Mr. Mapes will turn his 10 to 12 cows over to me for one year with 100 little pigs, and half the feed it will take to feed his 1,800 hens, with the increase of calves, I will take my wages out of the profits, and give him 10 per cent on the investment. I will make a plaything of the venture besides; I will not work over five hours per day, and play the rest of the time.

Washington. V. W. CLOUGH.

R. N.-Y.—We fear this sort of figuring will hardly go. Mapes says his hen feed for the year cost him $2,366. It will not do to say that a hen ought to eat half a pound of food per day and then multiply by that whether these hens consume that amount or not! We figure about five ounces of grain per day for our own hens.

SOME FACTS ABOUT GOATS.

I note an inquiry by G. W. D., Norfolk, Mass., for information in regard to clearing land with goats. Will you advise him that if he will communicate with this association we can probably assist him in securing goats? I say probably, for the reason that the demand is in advance of the supply. This association maintains a sales bureau which lists stock offered for sale, and supplies inquirers with copies.

I have personally tried sheep (Michigan half bloods and Shropshires) Angoras and common milch goats in clearing land, and prefer the milch goats, although all do good work. All the shelter that is required is a roof to get under when it rains. If there are many stiff high-bush blackberry canes or bull-briers in the pasture by all means select milch goats. Both breeds of goats like a large proportion of brush and a small portion of grass in their rations, and the sheep a large amount of grass and a small amount of brush. This is especially true of the English breeds.

The increase with milch goats is greater than with sheep or Angoras, and the kids will bring a better price and can be more readily sold. For instance, the prevailing price of a goat kid in the Spring for eating purposes is $4, at other times of the year 50 cents to $1 less, but never below $3. The kids are salable when but a few weeks old, and sell by the piece and not by the pound. Goats commonly have twins after the first kidding, and if the owner does not care to milk a goat one of the kids can be sold and the other left to nurse the mother.

It is advisable, of course, to sell the male kids. Goats which are not kept for milking purposes can be bred twice a year; that is some of them will breed twice a year. I have been told that users of goat meat never become tired of it, while they do tire of mutton. I have never tried it myself, as I do not use meat of any kind. If G. W. D. could secure a few purebred Swiss goats he would find a ready sale for the young stock at from $50 to $100 each. To secure quick results in clearing a pasture all the larger trees should be cut down, and the stock will kill the stumps by eating off the young shoots as fast as they appear. ELMER F. DWYER, Pres.

Standard Milch Goat Breeders Club, Lynn, Mass.

"I DESPISE a hypocrite." "So do I." "Now, take Jackson, for example. He's the biggest hypocrite on earth." "But you appear to be his best friend." "Oh, yes; I try to appear friendly towards him. It pays better in the end."—Boston Transcript.

These Seven Cows

May All Be Kept For One Year On

the product of one acre of land. It's hardly believable. And keeping seven cows for a whole year on one acre goes a long way towards reducing the cost of milk. Eureka Corn produced in one year on one acre 70 tons and 800 pounds. Figuring at the rate of 50 pounds of ensilage per day, which is a very liberal allowance, this amount will feed seven cows for one year, with enough left over for 261 feeds. This enormous crop won us our $50.00 gold prize for the heaviest yield. We believe this record cannot be broken by any other corn, but Eureka can still beat it.

We believe our crop of Eureka Corn for 1914 planting will germinate better than 98%. Eureka Corn was introduced by us about 25 years ago. It is a white, smooth dent corn, grows the tallest, usually from 16 to 20 feet, has the most leaves and is short jointed. If planted thin, it will yield two and three ears to the stalk. Planting Eureka Corn is as good as an insurance policy to any farmer. It grows where other kinds fail and the yield is tremendous.

EUREKA CORN

Grows Tallest—Has Most Leaves—Greatest Number of Ears

You do not need to plant your whole farm when you can fill a 200-ton silo from 4 or 6 acres with Eureka. We're selling Eureka at last year's prices. Good seed is going to be very scarce and much higher before the planting season is over. Ask yourself what corn is worth per bushel that will produce 70 tons and 800 pounds. We are not asking you to experiment, we are only asking you to buy seed corn that has been proven by thousands of successful farmers to be the best that money can buy. Read what some of our customers say.

New Hamburg, N. Y.

Ross Bros. Co.,
Worcester, Mass.

Gentlemen:—In reply to your inquiry about the Eureka Seed Corn, will say that there is nothing else like it for fodder. It grows a larger and better stalk and will grow anywhere. The party who filled our silo thought that our corn beat anything that he had seen and wanted me to get him some of the seed for next year.

Yours truly,
(Signed) J. W. CROWELL.

Mannsville, N. Y., Nov. 18, 1913.

Ross Bros. Co.,
Worcester, Mass.

Gentlemen:—The seed I purchased from you last Spring proved to be the best silo corn I ever raised. Most corn in this section was very poor owing to the long, dry spell we had. Most of my corn was 14 feet high. I want you to book me for 4 bushels of the best you have. I want it on the cob shipped same as last year. Several of my neighbors want to buy some, perhaps later will send you an order for them. Yours truly,
(Signed) W. E. WILLARD.

Greenwich, N. Y.,
Nov. 10, 1914.

Ross Bros. Co.,
Worcester, Mass.

Gentlemen:—I have been planting the Eureka Corn for three years, and as long as I fill my silo I shall continue to do so if I can get it. I have sent you each year an order for corn for my neighbors and have always been asked to send again. Quite a few have spoken to me now for next year. I hope to send in a larger order than last year.

Very respectfully yours,
(Signed) THOS. A. HARRINGTON.

SHEFFIELD WORLD'S PRIZE FLINT CORN

still holds the record for the heaviest yield of flint corn, 123.8 bushels, of crib dry corn from one acre. If you grow corn for grain, plant Sheffield. No other flint corn equals it. It can be planted later and will mature earlier than any other kind. It will produce more good ears, well filled out, than any other variety. Look out for your stock of flint corn before it is too late. There is a lot of poor corn on the market. Our stock of Sheffield has been tested and will germinate nearly 100%.

Eureka corn shelled is always shipped in our trade-marked burlap bags, and ear corn is shipped in rat-proof crates holding 70 pounds. Either buy direct of us or some of our agents who have the genuine. Write at once for catalogue and quotations.

Treat Your Sow Right.

"Keep on good terms with your brood sows." That is a suggestion that Jay Snyder of Hillsdale County, Michigan, declares will pay the farmer dividends whether he has but one sow or many.

"I fondle my sows as much as many would a pet. They are not afraid, it is mighty handy when they have pigs. The sows are not afraid of my harming them or their offspring, and I fondle the little pigs as I do the mother. It pays not only in two ways to be on good terms with the sow; in one way in handling the pigs, and the other is that the sow will be a better mother if she is not continually frightened. A sow is, in my opinion, as sensitive as a dairy cow, and should be treated as kindly. This treatment should be extended to every animal on the farm, and it will pay the owner in dollars and cents." W. J.

Chester White Breeders.

I have just received notice from Secretary Moore, of the Chester White Record Association, that the movement looking to the amalgamation of the National Chester White Record Association with the Chester White Record, has progressed so far that the ballot is being distributed to national members for action thereon. I wish you would state for the benefit of Chester White breeders in general and the national members in particular, the present association known as the Chester White Record was formed a year ago by joining the American and Standard Associations. We now have 800 members against 80 in the National, with $2,500 in the treasury, and year book printed up to date. For the good of the breed and to clear the field for our large, strong organization, we offer to accept the National certificates and give in exchange a certificate of membership in the Chester White Record free of cost, also to register the produce of animals registered in National. Without question the good to be derived should make the vote solid for annexation. It is also in order for the New York State members of the Chester White Record to suggest the name of a strong breeder for my place on the National committee for New York State. GEO. E. HOWELL.

Colorado Dairy Cattle.

For the first time in nine years a dairy department was added to the Western National Stock Show held at Denver last week. This Western show is the leading one of the United States in the beef classes, but the dairy interests of the West are growing fast. Last month another condensing plant was opened in this State at Lamar, by the Helvetia Company. This station is built to take care of 8,000 cows.

Holsteins naturally lead in numbers at the dairy show, with some very fine dairy animals. The Jerseys came next with a very complete exhibit from a fine son of San Aloi to little Maggie Dainty's first born, which she added to the show without the usual entrance fees. This little fawn-like calf was a decided attraction. Guernseys made a fine showing and attracted the most attention. Their perfect condition and uniformity made a beautiful picture. A carload of grade Guernseys were gobbled up by practical farmers to whom they looked good from a dairy standpoint.

The Holstein breeders had 36 animals from four herds. The Jerseys represented seven herds, with 30 animals and the Guernseys surprised every one with three herds represented by 18 "yellow and whites." The Ayrshires were represented by one very lively little bull. This breed should make a good record on some of our mountain pastures and should be better known out here. I was asked a number of times if there were any Brown Swiss on exhibition and this breed certainly has some warm friends out here.

Prof. A. L. Haecker judged the dairy animals. Since "Colorado expects every cow to do her duty" the fact that a good cow has on her winter working clothes should not handicap her when she is clean and in good condition under her overcoat. Judges should remember that the last of January is not early Fall.

J. B. P.

A FUTURITY TEST.—The New York State Jersey Cattle Club at its recent meeting in Rochester adopted a futurity contest, open to breeders in the United States and Canada, for heifers beginning under 30 months of age and finishing year tests during 1917, and each succeeding year thereafter. Heifers born after July 1, 1913, will be eligible for the 1917 futurity, and while supposed to be nominated before birth will probably be admitted any time prior to July 1, 1914. To the committee delegated to put the test in force was left some of the details of the test rules. These have not yet been definitely determined upon, and will be announced later. This notice is given that breeders may plan ahead, and begin the early development of any heifers they already have that will be eligible to this most interesting contest. HARRY S. GAIL.

SOCIALIST ORATOR: "Tell me why it is you have to work from morning until night." Auditor: "It is the only time we got. We sleep from night till morning." —Judge.

HOLSTEIN CATTLE
In the production of milk and butter the larger the cow the larger the profit, other things being equal. This principle has been established through the investigations of government experts and is generally recognized.
When a cow's milking days are over, size is still an important factor. The big Holstein-Friesian, weighing anywhere from 1,000 to 1,800 pounds with her clean white fat well distributed through her muscular system, proves a most profitable dairy beef animal.

WILL SILAGE SOUR THE SOIL?

Your article page 1, "Why the Land is Sour," brings a question to my mind that I would like to see discussed. I have been planning to build a silo, but a friend from Orange County, who lives in a section where shipping milk is main feature of farming, and where silos have been extensively used, says the farmers there complain about the fertilizing value of cow manure when silage forms a large part of the feeding rations. My friend admits that silage is a good milk-producing food, but says there seems to be very little if any fertilizing value in manure when silage is fed, and that the growing of corn takes a large area of land and seems to impoverish the soil, notwithstanding that all manure is returned to the land every day. The question in mind is whether, when silage is a large portion of roughage fed, the manure may not be acid, considering the fact that silage creates a large amount of acid in the process of fermentation? Is there any difference in values of manure when silage is fed, or when dry roughage alone is fed? J. J. C.

Stillwater, N. Y.

This question has been asked many times. There seems to be a general belief that manure made from feeding silage is sour. The natural way to find the truth of this is to "ask the manure." This has been done by the scientists who answer below:

There is no ground for the belief that manure made when a reasonable amount of silage is fed has an acid character. The acidity of the soil is due to other causes. I have fed acetic acid to sheep and also acetate of lime, and failed to get any pronounced acid reaction in the manure. J. B. LINDSEY.

Mass. Exp. Station.

I would state that manure made from silage should not be more acid than that made from any other forage, provided, of course, that large quantities of waste silage are not mixed with the manure. The organic acids present in silage are assimilated in the body of the animal, and the manure produced by such animals should not contain any marked quantity of free organic acid.

New Jersey Station. J. G. LIPMAN.

Organic acids in passing through the process of digestion and assimilation are changed into carbonates, which are alkaline. For illustration, potassium acetate is given to persons suffering from an acid condition of the blood to neutralize the acid. The potassium acetate so given is changed into potassium carbonate. There is, therefore, good reason to believe that the acetic acid or other related organic acids present in silage are converted into carbonate and bring about a condition the reverse of acid.

L. L. VAN SLYKE, Chemist.

Geneva, N. Y. Station.

There is no reason why the dung from animals receiving silage would be sour. In the digestive processes in the intestines of the animal the acids are largely neutralized by the alkalies of the bile. The remnants of uneaten silage would be sour, and if swept from the manger and mixed with manure the latter would be in an acid condition if hauled directly to the field. However, if the silage rotted before being placed on the land, its acid properties would be destroyed. A recent bulletin of the Ames, Iowa, Station, which has been conducting investigations concerning lactic acid in corn silage makes the following statement:

"To determine the influence of aerobic fermentation upon the lactic acid, a sample of spoiled silage from the top of the wooden silo was examined. The result for volatile acids on this sample was reported in our previous bulletin. The residue after distilling off the volatile acids was extracted with ether and treated with zinc sulphate in the usual way, but no crystals of zinc lactate could be obtained. In the rotting of silage by molds, the lactic acid evidently meets the same fate as the volatile acids. These acids are not simply neutralized by basic products resulting from the breaking down of protein, but are actually destroyed."

It is therefore evident that the acidity of manure from silage would not be high enough to have any decided effect on the soil when the manure is placed upon the field. A. A. BORLAND.

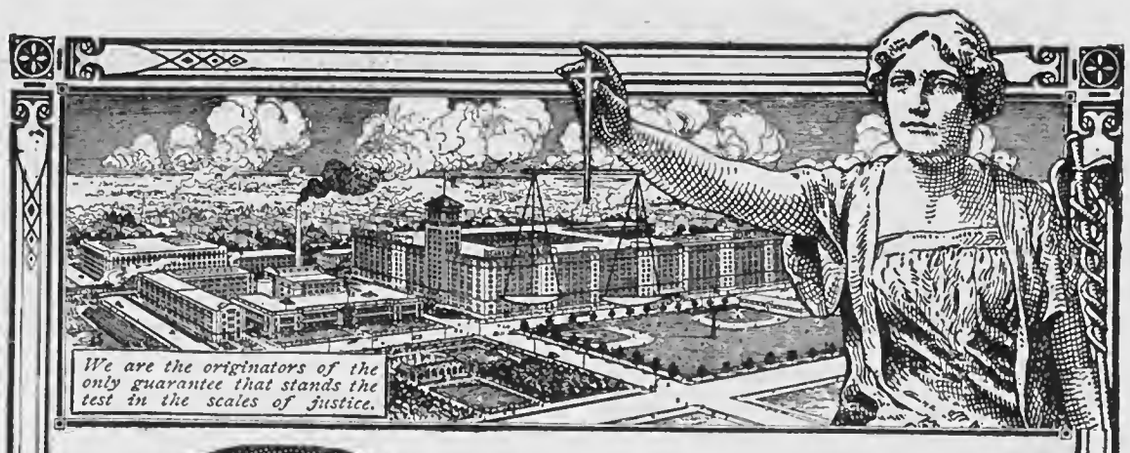
Vermont Exp. Station.

Cows Eating Boards.

My cows are fed silage twice a day and Timothy hay at noon, oat chop for grain fed on the silage. They want to chew old boards, even tear the battens off the barn. What do they require in their food to stop this, and what is the cause? E. B. G.

Castile, N. Y.

These symptoms usually indicate a depraved condition of the system caused by a lack of bone-forming matter in the feed. This is seldom found where cattle are fed wheat, bran or similar feed. Probably the best remedy is to give each cow a good handful of finely ground bone at least once a day in their grain. This usually removes the trouble, although a cow may be sick from other causes.



Solid Comfort Vehicles

Our price for the splendid buggy illustrated below is **$61.90.** It has triple panel auto seat, genuine leather upholstering, highest type body construction, triple braced shafts, best wheels made, full wrought fifth wheel, real long distance self oiling axle. Shipped from a warehouse near you.

CHURNING TROUBLES.

Is there any known reason why butter takes so long to churn at times, and again in only a few minutes, even when it registers 62 degrees? How hot does the cream have to be to be sterilized? If it is heated up and then cooled to churning temperature will the butter show signs of being melted? If the cream has been frozen, does it affect the churning once it is heated up to 62 degrees?
West Vienna, N. Y. J. C. G.

With all the conditions uniform there should be no variation in the time required for churning. However, there are many conditions affecting the churnability of cream, and in home butter making it is not always easy to control these conditions. In fact, the temperature of the cream will vary more than one would suppose. If the temperature of the cream is taken after churning a while it will frequently be found to be higher or lower than when the cream was put in. This may be due to the temperature of the churn, or air outside, or to the fact that the butter particles change their temperature more slowly than the milk in which they float.

I cannot say how hot cream would have to be to insure complete sterilization, probably close to boiling, and it would be necessary to maintain the high temperature for at least 30 minutes. Pasteurization, which kills about all living germs in the vegetative stale, occurs at 140 to 160 deg. Fahr. This will not affect the quality or texture of the butter, if no portion of the cream has been heated to so high a temperature as to cause some of the butterfat to melt and collect.

I have never had experience with frozen cream nor can I find anything about it in the authorities I have at hand. It is my opinion that it would not affect the churnability of the cream, if the cream be warmed slowly and held at the churning temperature for at least half an hour before putting in the churn. C. L. M.

GREEN FEED FOR SWINE.

I have about 14 acres of land that I want to rotate in crops that will furnish the best green feed for my hogs and pigs. At present only about two acres are occupied with a growing crop, Blue grass sod; the remainder is ground that grew oats and rape, cornstalks, and some parts of lots that will be taken off present feed and barn lots. All of it is good rich corn land. I had thought of putting a light seeding of oats with four quarts of clover, and two quarts of Alsike per acre, on the ground that grew oats and rape last year, rape on the stalk ground, and pasture the Blue grass until the rape is ready to turn into. Then fit lot number three, which contains the Blue grass, and plant an early variety of corn, sow rape at the last cultivation, and hog down as soon as the corn is fit. About the middle of August I will fit the rape field for rye, sow not later than September 1, if the weather conditions are right. My plan is to have the grass for early pasture for sows and pigs until the rape is ready; after that the rape and the oats and clover, then the corn and rape, with the early sown rye for late Fall pasture. After the first year, I will drop the oats, as it is used this year, only because I have to have a Spring crop to get started. After that the rotation would be: Winter rye, last year's seeding of clover and Alsike, until rape, sown on last year's corn lot, was ready; then plant clover lot to corn, to be fed off; rape furnishing feed until plowed for rye, the clover following the rye, until corn is ready. Is this rotation practical? If not can you give me one that is? Which would be better, sow clover with the rye in the Fall, or wait till Spring? While the prime object is to have some green feed through all the growing season, I especially desire to have green feed early for the suckling sows and little pigs.
Woodford Co., Ill. E.

The ration you mention is practical, but may be improved upon. You say nothing about sowing Canada field peas, which is one of the best crops to grow to furnish pasture for hogs. A mixture of early oats and Canada peas will afford the earliest grain feed to be obtained from Spring sowing. The peas can be plowed under three inches deep as early as the land is in fit condition, and the oats should be drilled in or broadcast a few days after the peas are sown. In the latitude of central Illinois these will be in the dough stage about the 20th of June, and can be pastured off or mowed and fed to the hogs, furnishing the earliest grain feed of which I have any knowledge.

If peas are not sown perhaps the next best thing is succotash, which can be made of a mixture of Manshury barley, or the Success or some other beardless variety, and Early Champion or Sixty Day oats. These will be in the dough stage at about the same time as the peas, possibly a little later, and will furnish feed as long as it lasts.

A mixture of Kherson or Silver Mine oats and Early Java wheat will furnish later feed, say about the 10th of July. A later variety of oats and the latest Spring wheat would carry the feed on until the first of August. This, of course, involves a separation of the field of grazing grain into different lots. If the hogs taking their grain feed from the succotash can have the use of good clover pasture they can be carried on fairly well until an early variety of corn can be grown. Be sure to plant the earliest variety of corn, either the early types of sweet corn or Pride of the North, or any other of the early Northern varieties—varieties that have been forced from necessity to make their growth in a short time. Pigs that come in March can in this way be pushed along to make weights of 160, 175 and 180 pounds at little expense and will bring a good price in the market. With regard to sowing clover with rye in Spring or Fall; in my experience I have always obtained a better stand by sowing clover in the Spring. Fairly good results, however, may be secured by sowing the rye in the Fall and the clover immediately after, in a seed bed that is well prepared. H. U. W.
Illinois.

THE NEW YORK STATE BREEDERS' ASSOCIATION.

PART II.

The closing session was marked by an original presentation of the theme "Community Interest in Live Stock" by Dr. Eugene Davenport, Dean of the Illinois College of Agriculture. Prof. Davenport's address mingled the philosophy of a great teacher with the discussion of practical details of community effort, and was listened to with appreciative attention. Dr. Davenport believes that individual preferences should be subordinated to community choice in the breeding of animals, and that in making such choice the natural advantages of any locality should be carefully studied and have first consideration. Coöperation is in the air, and in no way can people begin to get together in common effort better than through live stock breeding. The average farmer is, of necessity, conservative; he has no capital for experiments; the steps which lead from pure individualism to coöperation must be short, and each operation must show a profit; otherwise the farm will be lost. Coöperative buying is comparatively easy, and coöperation in selling by small breeders of live stock is absolutely essential. The small breeder cannot afford to find his own buyers. The improvement of breeds, also, is beyond the efforts, or lifetime, of any one man; knowledge must be obtained by consultation and discussion together, and must be handed down from one generation to another. We are not yet ready for community ownership, save in a small way, but a beginning may be made by common ownership of valuable sires.

The closing address was made by Dr. Carl Gay of the University of Pennsylvania, who spoke of "Market Horses." Dr. Gray believes that the commereial draft horse is an important a proposition as he ever was, and that the motor has not displaced him. A large Phildelphia firm found that in delivering sugar, horses saved 50 per cent. in cost as compared with motor trucks. The demand for saddle horses and hunters was never greater, and the profits in breeding them are large. The harness horse in the cities is also "coming back," though his breeding now is probably less profitable than that of draft horses and saddlers. Breeding is only one factor in the production of fine horses; environment must equal ancestry if a standard is to be kept up.

Before closing its final session the Association adopted resolutions favoring the holding of a Winter fair at Syracuse; the adoption of an amendment to the tuberculosis law calling for physical examination of all dairy herds in the State and the elimination of diseased cattle; the compulsory pasteurizing of all skimmilk before distributing it from creameries or cheese factories; the elimination of all unsound and scrub stallions standing for service in the State, and the adoption of a law requiring State registration of all dogs, with a license fee, one half of which should go to the county. M. B. DEAN.

THE stage drivers in Yellowstone Park are bothered considerably by the foolish questions asked by their passengers and often resort to satirical answers. Once a woman tourist who seemed deeply interested in the hot springs inquired: "Driver, do these springs freeze over in Winter?" "Oh, yes, yes; a lady was skating here last Winter and broke through and got her foot scalded."—Everybody's Magazine.

GLOR BROS. & WILLIS MFG. CO.
54 Main Street, Attica, N. Y.
"Everything for the Barn"

AILING ANIMALS.

Rough Skin.

What can I do for my Chester White brood sow that has some sort of skin eruption? Back of her ears and in the wrinkles below and around her eyes there is a dark colored wax or filth. She has clean quarters and bedding at all times. This substance in places around her head hangs in bunches and the skin looks irritated. I have examined for lice but cannot find any. C. W. A.

Cleanse the affected parts and then apply an ointment of one dram each of sulphur and boric acid and one ounce of lard. Repeat the application as often as found necessary. Castor oil well rubbed in will also remove such patches of warty skin. A. S. A.

Lice; Stiff Knees.

1. I have two colts that have lice. What is there will kill them that can be put on the colts in cold weather? 2. I also have a horse that is about 18 years old; was driven on a delivery wagon before I bought him and his knees are quite stiff. Is there anything that can be done to help his knees? E. L. B.

1. Try pyrethrum powder brushed into the hair. If powder does not suffice wash affected parts with a tea made by steeping four ounces of larkspur (stavesacre) seeds in a gallon of boiling water for 12 hours; then strain. This will kill lice quickly and colts should not catch cold if you do the washing in a warm place and blanket them until dry. Then do not let them out in the cold for a few days, but gradually accustom them to cold in the stable, without causing drafts. 2. Such cases are chronic and incurable. A. S. A.

Mud Fever.

I have a work horse that has some trouble with one hind leg. On the inside between the gambrel and ankle the skin has cracked three or four inches every half inch or so. Can you tell the cause and a remedy? I do not work her much this Winter. It has been this way for about two months. G. C. H.

This condition usually is caused by wet and slush and not drying the leg thoroughly when the horse comes into the stable. It is most likely to affect a white leg and if the horse is allowed to stand in a draft in the stable. Poultice the leg with hot flaxseed meal for three days; then wash and dry thoroughly. Do not afterward wash the leg, but twice daily wet it with a solution of four ounces of Goulard's extract, two ounces of glycerine and water to make one pint; shake. If this does not suffice keep the parts well daubed with a mixture of four ounces of sulphur, half an ounce of coal tar disinfectant and a pint of sweet oil, well shaken together. A. S. A.

Scratches.

I have a horse six years old, have driven her nearly every day for over two years. She has been troubled with scratches nearly all of the time—the only time I have nearly healed them is in the Summer. I have tried nearly everything. I think it is in her blood. Have been giving her sulphur this Winter in her grain. Her ankles swell a little at night and sometimes she limps a little when she first starts out. Will you advise me what to do for her as she is worse in the Winter and Spring. E. M.

Do not wash a horse's legs from November to May in any northern climate. Washing induces scratches, as the skin rarely is perfectly dried after the washing. Washing also aggravates scratches. If the parts are not filled with old cracks and hairless, calloused skin, but are simply sore, poultice with hot flaxseed meal for three days, then wash once, dry thoroughly and twice daily afterward apply an ointment of two drams of sulphur, and one dram each of spirits of camphor and compound tincture of benzoin to each ounce of lard. If an old case of calloused, cracked skin blister the parts with cerate of cantharides, wash the blister off in two days and then apply the above ointment twice daily. A. S. A.

Diseased Joints.

I have a three-year-old colt that was kicked a month ago in her hind leg in the gambrel joint. Have tried several remedies, also have had veterinary, three different ones. The last one has helped her some by binding her leg up in lime. It is a bad sore, though, yet I have to help her get up, and she holds her leg up as though in pain. It has also run. I also have a large black horse that got his hind leg over a plank and scratched his gambrel joint and his leg is getting the same as the colt's. It is all swollen. Has broken and is running. He holds it up all the time and acts as though in pain. Can you tell me of anything that will help them? J. B.

Such cases are most unpromising and should have had correct treatment from the first. Do not use lime. Clip off the hair and wash the parts perfectly clean. When dry paint the joint and swelling with tincture of iodine and repeat the painting each other day. Use the tincture freely, but stop for a few days when it blisters. Twice daily inject into the discharging places a little of a mixture of one dram of iodoform in two ounces of sulphuric ether. Keep the mixture tightly corked and do not open it where there is an exposed light. If improvement is not speedy discontinue this treatment and once daily cover the sores and hock with a mixture of one part each of tannic acid and powdered starch and six parts of boric acid; then with cotton batting and a clean bandage. A. S. A.

Overheated Horse.

Would you advise me what to do about a horse? He is about 12 years old, and is in good condition, works and feeds well, but I cannot get him to sweat, and he pants when at work. He has been that way for about six months. I have had him under veterinary care, but he does not seem to improve any. Long Island. J. G.

Heat exhaustion is the usual cause of such symptoms, and the horse rarely recovers. Such horses often are "dummies" with affected brains, and have little sense or vigor. Have him clipped at once. Feed flaxseed meal and carrots freely. Black strap molasses also would be good for him. The veterinarian can cause sweating by administering drugs, if it does not come on when you gallop the horse when warmly blanketed. A. S. A.

Tumors.

I have a cow which is developing small hard lumps on her left shoulder, between the skin and flesh. They are of slow growth, and at present range in size from one-quarter of an inch to one inch in diameter. They can be moved from side to side with the fingers. The cow seems in excellent health otherwise. Will you advise me? E. A. C.

These may be cancerous metastatic tumors, and if so will return worse than ever if removed. Better not cut them out, but once daily swab each of them with tincture of iodine, and if they soften open them for evacuation of matter, after which go on using the tincture until the wounds have healed. A. S. A.

YOU NEED THIS $7.50 Stewart Ball Bearing Machine

It's a valuable outfit that should be in every stable. Those who know the horse best have agreed that to clip him at the proper time improves him in every way. He looks and feels better, does more work, rests better and gets more good from his feed. Insist on having the "Stewart." It's the easiest to turn, does the fastest work, stays sharp longer and is more durable than any other clipping machine ever made. Get one from your dealer, or send $2.00 and we will ship C. O. D. for the balance. Your money and transportation charges back if not pleased.

WORK WITH HOG CHOLERA IN IOWA.

Noting in a recent issue the lament of an Ohio farmer over losses from hog cholera, I offer the brief statement of facts to show what has been done in this, Dallas County, Iowa, toward stamping out the disease. About one year ago this county was selected by the United States Department of Agriculture as one of the three counties in the United States wherein the Federal Government, in coöperation with our State Agricultural College and State Veterinarian, would attempt to eradicate the dread disease, and arrangements were made to begin work on July 1. At that time many herds were infected with cholera, and some farmers had lost heavily from its ravages.

During the first six months Dr. O. B. Hess and his two assistants treated a total of 15,650 hogs, with a loss of only 14 per cent. Some idea of the magnitude of this work will be gained when we state that each hog is caught separately and held while its temperature is taken, and then serum is administered by the temperature, weight and condition.

The total number of hogs treated during the first six months is subdivided as follows: Those with high temperature, 5,773, loss 37 per cent. Well hogs in *infected herds*, 6,815, loss 3 per cent. Exposed hogs in clean herds, 3,149, with no loss. Total loss in six months, 2,222. On January 1, 1912 there were 84,618 hogs in Dallas County. Loss from cholera that year, 19,821, or 23 per cent. On January 1, 1913, there were 118,550 hogs in the county. Loss during 1913, not to exceed 11,000, or about 11 per cent.

In view of the fact that no herds were treated during the first six months of 1913, and that the supply of serum was inadequate during the first two months after treatment was begun, the results are most gratifying. In counties adjoining Dallas losses during 1913 range from 26 to 43 per cent., and in some counties as high as 70 per cent., thus showing that systematic effort will bring the disease under control. In all cases where Government serum is used the treatment is absolutely free to the farmer. The county furnishes the United States Inspectors with office rooms in our court house, with telephone connections with practically every farmhouse in the county, while Uncle Sam has provided an automobile whereby the doctors can respond quickly to the C. Q. D. messages as they come in.

If a probable loss of a half million dollars per year in a single county can be averted by the expenditure of $25,000, or possibly much less than this sum, it would appear to be a good business proposition. These free demonstrations have also been conducted during the past year in Montgomery County, Indiana, and Pettis County, Missouri, with equally satisfactory results, and some preliminary work has been carried on in Nebraska. The recent liberal appropriation by Congress of $500,000, for the control of hog cholera, will enable the Department to carry the good work into other hog producing States. M. J. GRAHAM.

Loud Hired Man and Cows.

A loud boisterous hired man is the most expensive man about a dairy herd. Should he give his services free, then he would be expensive about half a dozen cows. Better hire a good quiet man, even if he is a little slow. See that his disposition is kind toward a cow. If he has children and is good to them, and is kind to his wife, the dairyman can feel sure that he will treat his cows kindly. A good dairy cow is a nervous creature. She is intelligent, and a prominent dairyman declares that she is as susceptible as a person of fine sentimentality. A rude, uncouth bumpkin is out of place in a parlor, and he should be equally so in a dairy barn. One dairyman who occasionally uses an oath, told me that he would not have a man about who swore. When a cow is worried, she loses her appetite as a person does. It stops the functions which maintain the cow, digest her food, and convert it into milk. An abused cow is a hard keeper, and a little kindness will return the owner dollars and cents. W. J.

PRODUCTS, PRICES AND TRADE.

Milk prices remain practically the same as last week—$1.81 for B and 10 cents less for C. The "surplus," purposely manipulated to all appearances, is heavy, making a strong argument against the producers.

*

The higher grades of creamery and dairy butter advanced two cents during the week. Under grades and packing stock remain practically the same. A very wide range is noted in storage—from 20 to 29 cents.

*

The bad weather and snowed-in streets have unsettled the market for eggs, as well as fruits and vegetables. Good eggs, more or less frosted, have been working out at 28 cents and under. Some fancy white sell at 38, and brown, 30 to 31. Trade in European eggs is very dull. 25 to 26 cents being the top for fresh and 19 to 20 for preserved.

*

We imported 52,783,675 pounds of wool in 1913, valued at $12,589,862, and wool manufactured goods worth $13,783,800.

*

The popularity of the five and ten cent idea is shown by the years profits of the leading corporation handling this line of goods, $6,461,118, providing a dividend of 10.82 per cent on the $50,000,000 of common stock.

*

Our imports of raw silk during 1913 were 27,978,805 pounds, valued at $89,770,070; in manufactured goods $31,776,210. Japan sent the largest quantity of raw silk, $63,316,257; China, $15,523,856; France, $9,535,326. In manufactured goods, France led all others, $5,450,372; Japan, $5,450,372.

*

Fig culture in Texas is increasing. Parts of the State appear well adapted to this fruit. Plantings this Spring will make a block of 500 acres of trees in one section. The fruit sells fairly well raw, but is hard to ship and mainly handled preserved or dried.

*

In a case regarding the grading of fruit, the Pennsylvania Supreme Court has ruled that "fancy" and "strictly fancy" are synonomous, and that a buyer who specifies that goods shall be "strictly fancy" can demand no better quality than what by common consent in the trade passes as "fancy." "Extra fancy" is considered to have a different meaning, carrying a higher quality idea.

*

The port of Halifax, Nova Scotia, handled a total shipping tonnage last year of 3,182,923. Customs receipts were $2,198,464. Imports were valued at $12,404,055, and exports, $15,173,230. The Dominion is planning extensive harbor improvements to cost $30,000,000.

*

Can you give the name and address of a reliable commission man in New York who will handle my eggs and make the honest returns at market prices? I will give a guarantee on every egg being strictly fresh gathered from my own nests. Nothing over one week down to one day old. I have from two to three crates a week. W.
New Jersey.

If by market prices is meant the quotations appearing in newspapers and price currents we know of no honest dealer who will make such a guarantee. All he can do is to sell at the best price he can get, and the quoted figures are not always representative of a large volume of the day's business.

Buyers may be divided into two general classes, those who want certain grades of goods and are not limited as to price, and those who must consider price every time. The latter class is far in the majority. There may be, for instance, on a certain day, 25 customers who will pay 45 cents per dozen for choice white eggs by the case, and perhaps 100 whose limit is 40 cents, because their retail trade will not stand a higher price. It is evident that when the 45 cent buyers are supplied, those eggs must sell at the lower price if sales are to be made. Thus two neighbors may send eggs of the same grade to New York at the same time, one getting 45 cents and the other 40 and yet both lots handled honestly by different dealers, or the same dealer, for that matter, because he may have had only one high-priced egg customer that day. We are glad to give the names of commission men who are considered honest and capable in their special lines, but cannot guarantee the price the goods will bring. W. W. H.

VISITOR: "How does the land lie out this way?" Native: "It isn't the land—it's the land agent." — Philadelphia Record.

"A WIFE gets a third of her husband's property, doesn't she?" "No." "Why, I thought the law gave that to a man's wife." "No; only to his widow."—Baltimore American.

MRS. NEWRICHE: "I believe our next-door neighbors on the right are as poor as church mice, Hiram." Mr. Newriche: "What makes you think so?" Mrs. Newriche: "Why, they can't afford one of them mechanical piano-players; the daughter is taking lessons by hand."—Puck.

Molassine Meal
MADE IN ENGLAND
A Perfect Feed for Your Team and Farm Horses
It is not only the value of Molassine Meal in itself but its digestive and antiseptic properties that lend great additional value to the rest of the ration used.
Feed three quarts per day to each horse in place of the same quantity of other fodder. In a few weeks you see improved results in increased strength and glossy coats.
AMERICAN ICE COMPANY
WASHINGTON, D. C.
When your salesman called on me, some months ago, I very reluctantly agreed to try out Molassine Meal on five horses from four of our stables—20 HORSES IN ALL. These were young, green horses, NOT IN GOOD CONDITION.
In less than four weeks they showed most surprising improvement, gained from 40 to 65 lbs. each, and are now working regularly every day.
I cannot say anything too good about Molassine Meal.
Yours very truly,
GEO. A. LOVELESS,
Supt. of Stables.

IT'S FROST-PROOF
AIR-TIGHT PERMANENT
No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

FULLY GUARANTEED
to be as represented. Our 63 years of manufacturing experience is valuable to you. FREE catalog explains all. Write for it today. Agents Wanted.
The E. W. Ross Co., Box 13 Springfield, O.

EVENTS OF THE WEEK.

DOMESTIC.—During the Federal investigation into the loss of the steamship Monroe, it was brought out Feb. 12, that the captain, E. E. Johnson, left his vessel in the first boat that got away. It was brought out that under the rules governing sea traffic under "ordinary conditions" the Nantucket had the right of way. The first officer declared that he had never seen on the Monroe any boat drills in which the boats were lowered far enough to allow their keels to touch the water. There was no chronometer on the Monroe. The ship's clock in the pilot house was set by a time ball at Norfolk at the beginning of each voyage. The first officer said the captain never used the bridge except when the ship was making dock.

The Hazard canning factory at Shrewsbury, N. J., was burned Feb. 14. It was the largest factory of the kind in New Jersey and was built by the late E. C. Hazard. The loss is $100,000.

Five men were killed Feb. 12 by an explosion in the packing house of the Hercules Powder Works at Kenvil, N. J., owned by the Du Pont Powder Company. How the explosion occurred will never be known, as all the men who were in the packing house at the time were killed.

An earthquake shock was felt all over the city and district of Quebec, Canada, Feb. 14. The shock was violent enough to wake hundreds of people.

With nearly half the population of Laytonville, Mendocino County, Cal., suffering from smallpox, and the disease epidemic among the Indians of the Round Valley reservation and throughout the mountainous sections of Mendocino and Lake Counties, the Board of Health has declared a quarantine covering a wide area. Orders have been issued to prohibit the attendance at the schools of any child not vaccinated.

Tides even higher than those which caused so much destruction in the storms of December and January shut off Seabright, N. J., Feb. 14, from all transportation connection with other towns. Tracks were washed out, and in other places are piled high with debris.

A smaller percentage of fatalities in the metal mines of the country in 1912 than in the year preceding is noted in a statement made Feb. 14 by the Federal Bureau of Mines. It shows that in 1912 the percentage was 3.91 per thousand employed, while in 1911 it was 4.19. For coal mines the figures were 3.27 and 3.73 respectively in 1912 and 1911. Fatalities in the metal mines of foreign countries, with a few exceptions, are lower than here, Italy being 1.18, Portugal 1.34, Spain 1.49, Germany 1.51, Great Britain 1.53, Japan 1.76, France 3.16, Transvaal 4.14.

State's Attorney Judson of Connecticut, Feb. 16, quashed the manslaughter indictments against five officials of the New York, New Haven & Hartford Railroad, but refused to annul the indictment against former President Charles S. Mellen. The indictments grew out of the wreck at Westport, Conn., on Oct. 3, 1912, in which seven persons were killed.

Lieutenant J. McC. Murray, attached to the Pensacola Naval Aeronautical Station, fell 800 feet into Pensacola Bay, Fla., Feb. 16, and was killed. His body was recovered floating about 100 yards from the wrecked aeroplane. The death of Lieutenant Murray makes the total number of aviation fatalities 265. Since January 1, 11 aviators have been killed.

J. B. Smith, vice-president and general manager; F. C. Mills, superintendent, and E. H. Mayer, chief weigher of the Western Fuel Company, were found guilty at San Francisco, Feb. 18, of defrauding the United States Government by obtaining illegal tariff rebates through false weights. E. L. Smith, a checker, the other defendant, was acquitted. The specific charge against the directors of the Western Fuel Company was conspiracy to defraud the Government by making false returns on the weights of cargoes of coal incoming into San Francisco. The alleged frauds were said to aggregate between a half million and a million dollars.

FARM AND GARDEN.—The Federation of Jewish Farmers held a Farmers' Week, Feb. 23 to Feb. 26, at the Baron de Hirsch School, Woodbine, N. J. The programme was arranged so that the first two hours in the morning were divided into three kinds of lectures, one devoted to poultry, another to dairy and field crops, and the third to horticulture. The last two hours in the morning were devoted to the general lectures. In the afternoon, the laboratory and demonstration work was divided into three various groups, so that every farmer could attend only those periods in which he was most interested.

The Governor of Utah, William Spry, and other leading officials of that State met in Philadelphia, Feb. 14, with leading Jews of that city and made arrangements to send 85 Philadelphia families to the Clarion colony of Jewish farmers in San Pedro county, 200 miles south of Salt Lake City. The Utah officials came as guests of the Jewish Agricultural and Colonial Association. The association sent 50 families to Utah three years ago, and Gov. Spry said that they have became excellent farmers and are winning prosperity. The association plans to send 100 families to the colony within a short time. They will be taken from the ghetto districts of New York and Philadelphia.

The 27 suits brought by the State Fish and Game Commission to recover penalties aggregating $80,000 from the Franco-American Poultry Company, which has farms at Little Falls, N. J., and Goshen, N. Y., were discontinued Feb. 17, on the payment of a fine of $5,500 by John V. Snyder, one of the officials of the company. The complaint charged that black and mallard ducks trapped in Virginia and brought to Little Falls for breeding purposes were recrated and shipped to Goshen, where they were reshipped to hotels and restaurants. August Silz and other officials of the Franco-American Poultry Company were fined $20,000 in New York State recently for importing the game birds from Little Falls to Goshen.

COMING FARMERS' MEETINGS.

Sixth National Corn Exhibition, State Fair Grounds, Dallas, Texas, February 10-24.

Annual farmers' week, Vermont College of Agriculture, Burlington, Vt., February 23 to 27.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., June 24-26.

Hay, $15; corn, 70 to 80; oats, 50; potatoes, 90 to $1; apples, $1.25 to $1.50; Oregon apples, 30 to 40 cents per dozen; celery, home-grown, 40 cents per dozen; cabbage, 3½ to four cents retail; turnips, 80; butter, retail, 35, further up the road, 26 to 28; eggs, 35, have been 40 and 45 until quite recently. Poultry about holidays ruled at 28 and 30. This is a mining and railroad town and the merchants seem to deal more with Pittsburgh houses than with farmers. I. A. D.

East Brady, Pa.

Steers, seven to eight; veal, 10 to 11; lambs, six to seven; hogs, 8½; potatoes, 80; eggs, 25; butter, 28; Timothy, $11 in mow; clover, $8.50; mixed hay, $9 to $10; oats, 36; wheat, 90; corn, 80 cents per cwt. Apples not as good as I fed my horse last Fall, retail at 60 to 75 cents a peck; at 60 cents, a barrel would bring $6.60. The apples exposed for sale at five cents each and three for 10 are from all appearances Western apples. Spitzenburg, Rome Beauty and Jonathan seem to be the favorite and why this should be so I cannot see, when much better apples are grown all through this section, Southern Michigan, Ohio, New York and Pennsylvania. H. H.

Fort Wayne, Ind.

Corn, 75 cents per 100 pounds; clover seed, $7.50; wheat, 91 cents a bushel; oats, 35; Timothy, $12.65, baled; clover, $10.15; mixed, $10.50; potatoes, 75; apples, $1; eggs, 32; butter, 27 to 30; chickens, 11; steers, six to seven; hogs, eight, dressed 10; lamb, six; veal, 10.

New Haven, Ind. H. H.

CAMBRIDGE STEEL PLOW CO. 700 Foundry St. Cambridge, N. Y.

$1.00 Puts It On Your Farm

THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.

Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)

Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."

Takes Buckhorn from Clover.

Sorts Corn for Drop Planter.

Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.

Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Here's my proposition, and if you are a smart man you will write me before sunrise tomorrow:

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality.* That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

The Henyard.

THE EGG-LAYING CONTEST.

The fourteenth week of the contest shows a tremendous gain in egg production. Last week the number laid was 987, this week it is 1,669; a gain of 682 eggs in one week. The White Leghorns alone made a gain of 375 eggs over the previous week. But the gain is general all along the line. The highest score for the week was made by Dr. N. W. Sanborn's pen of Buff Wyandottes, their score being 39.

Tom Barron's White Wyandottes, Pinecrest Orchard's S. C. Reds and the "sour milk" pen of White Leghorns from Storrs Agricultural Station, all three pens laid 38 eggs each.

Another pen of White Leghorns from Storrs Agricultural Station laid 37, and Dearborn & Sharpe's pen of S. C. Reds also laid 37. Cecil Guernsey's White Leghorns laid 36, and a pen of White P. Rocks from Storrs Agricultural Station laid the same number. Barron's White Wyandottes have laid 524 altogether; the nearest score to this is by Francis F. Lincoln's White Leghorns, 429. Barron's White Wyandotte pullet No. 1, that was broody for several weeks started in to make up for lost time by laying every day. Homer P. Deming's S. C. Red pullet No. 7 also laid every day last week.

The White Laced Red Cornish commenced this week, one pullet laying one egg. The Silver Campines have the distinction of being the only pen that has not yet prodnced an egg. Below are some of the week's scores, and the totals of the leading pens:

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Sunflowers and Corn for Silage.

Can you tell me what I can plant with my corn for silage that will make a heavy growth to be cut and bound with corn harvester? The seasons are short, and corn does not get ripe very often here. O. S.

Clinton Co., N. Y.

I believe that the inquirer will get the most fodder for a silo by adding a few sunflower seeds to his corn sown for silage. Apparently he does not have good conditions for corn culture. Therefore, I cannot advise using Soy beans. The thing to be guarded against is the possibility of getting too many sunflowers in the mixture. If he used a pint of sunflower seeds mixed with the corn planted on one acre I think he will have plenty of sunflowers in the mixture. These sunflowers should be of the kind that has many small heads rather than a single large one per stalk. Sunflowers will make more growth on poor land in a dry season that will corn. It is true that they will rob the adjoining cornstalks of moisture and food. To some extent the result will be an increase in the total amount of fodder produced, and some decrease in its feeding value. It will surprise anyone not familiar with ensiling sunflowers to see how the cattle eat the stalk when it is cut up and softened in the silo. I have known cattle to reject the sunflower leaves and some of the head, but to clean up the pieces of stalk. E. R. M.

Bakery Refuse for Pigs.

I have three shotes, weigh 140 pounds each, and am feeding them corn, also corn and oat chop, half oats, half corn, ground with the cob. I can get the scrapings of the bread troughs and sweepings of the floor of a bakery; would it be wise to mix it with the above? Sweepings, etc., are flour, a little lard and dough, about 20 barrels a week. K. H. J.

Bethlehem, Pa.

No doubt the scrapings from the bread troughs would be all right and add to the value of the ration you are feeding your shotes, but floor sweepings are not desirable at any price, unless they are carefully saved for feeding purposes, and all rubbish and unclean material kept separate. The common practice in such places is to dump everything from sour bread to match boxes and tin cans into the garbage can, and expect the pigs to fatten up quickly. C. S. G.

Green Bone and Mash.

Is green cut bone good for hens as well as beef scrap? I also wish to grind up whole corn, wheat and oats for dry mash, adding to it oil meal and beef scrap. How much by weight should I grind of the corn, wheat and oats. Would I need bran and middlings? The hens are White Leghorns. How much green bone would you feed daily to 100 hens?

New Jersey. E. F.

Green cut bone is a very good feed for the purpose of forcing egg production; but should never be fed to breeders previous to or during the breeding season, as it impairs the strength of the egg and its chances of producing a lively chicken. A good dry mash can be made by grinding up your corn, oats and wheat using equal parts by weight and adding an equal part of bran and middlings mixed. About three pounds per day of green cut bone would be sufficient for 100 hens. While it would be possible to feed heavier than this we do not think it would pay unless you were going to get rid of your hens very shortly. C. S. G.

A Dairy Ration.

Will you balance me a ration for my dairy from the following feeds? I have corn silage and mixed hay, being Timothy, June grass, clover and swamp grass mixed. I can buy the following feeds: Mixed wheat feed, $26; gluten, $32; cotton-seed meal, $34; cornmeal, $29. Give as cheap a ration as you can. My cows weigh from 600 or 700 to 1,000 pounds. I have one registered Ayrshire, two grades and rest are grade Jerseys. I am now feeding four pounds mixed feed, four pounds gluten per day per cow. My fresh cows are giving 24 to 29 pounds per day; one small two-year-old gives 20 pounds. F. T.

Charlotteville, N. Y.

You are feeding a fairly well-balanced ration at the present time and if you are getting the desired results there is no reason why you should change. It would be advisable to watch the condition of your cows closely and if they show any signs of falling off in flesh you can add a little cornmeal to the ration. C. S. G.

Whey and Tankage.

Is there any nourishment in cheese whey for young pigs or any stock? I am using it now for my chickens, to make mash. An article in THE R. N.-Y. regarding young pigs says we can use tankage in the place of oilmeal. I would like to know what tankage is. C. P. R.

Whey has some feeding value for pigs or calves. It contains a little protein, some fat, unless this has been removed by a separator, and most of the carbohydrates of the milk. Experiments in pig feeding show that 785 pounds of whey saved 100 pounds of grain. I have heard of a farmer who, on being asked how he raised such good hogs, said he fed nothing but whey, but admitted, on close questioning, that he "ried it up a little with Injun meal." I should prefer flour middlings to "Injun" or cornmeal. When fed to calves in too large quantities or very sour it is apt to cause scouring. Fed judiciously, and with some other feed, calves do fairly well on it.

Tankage is made from packing-house scraps cooked under pressure, the fat being removed. This is entirely different from fertilizer tankage, to which chemicals are added, and which cannot be used for stock. The tankage is dried and ground. C. L. M.

Feeding Rye.

1. I have a registered Holstein bull, coming year old in Spring. Not very large. What is the best feed I can feed to make him grow and get ready for service in the Spring? 2. What proportion of rye is it safe to feed mixed with oats to a mare with foal? Is rye hurtful to feed cows that are coming fresh in Spring? A. G.

1. Feed him plenty of clover or Alfalfa hay and add roots or silage. As concentrate feed oats, bran and flaxseed meal. Make him take plenty of outdoor exercise every day. 2. Do not feed any rye to horses. Keep it for the hogs, in the form of meal, as a part ration. Rye and wheat are not suitable feeds for horses, tend to cause indigestion and skin irritation and incidentally, therefore, may cause abortion. Mix wheat bran with the oats. Do not give rye to the cows. A. S. A.

Cow Holding Up Milk.

I have a Jersey cow which freshened on January 29. Since her seventh milking we cannot and she will not allow us to take all the milk from her, the udder apparently containing more milk. Her flow is decreasing. The calf was taken from the cow after fourth day—calf being fed artificially. S.

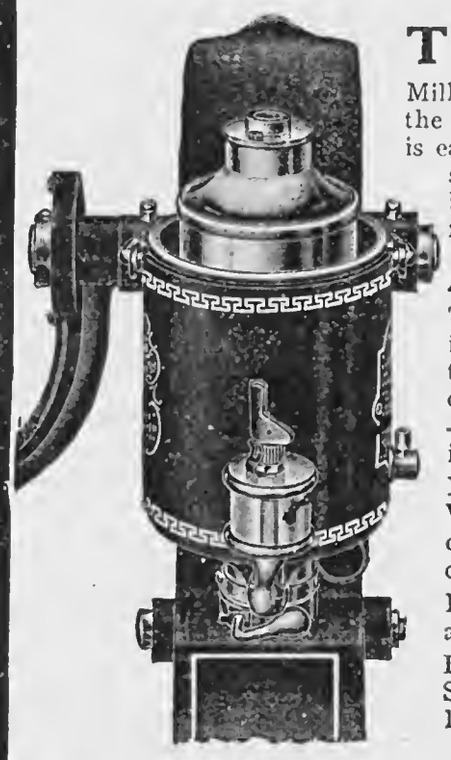
Put the calf near the cow at milking time and gently massage the udder for a time before milking. If she then lets down her milk gradually increase the distance between calf and cow at each milking time and the cow may in time stop holding up her milk. Feed her some relished feed at milking time. If trouble continues rub udder with warm melted lard at night and feed warm sloppy mashes of bran, oatmeal, flaxseed meal and molasses to stimulate a flow of milk. A. S. A.

Here's an Exclusive Feature on the 1914 Model

UNITED STATES CREAM SEPARATOR

This Liner fits into the bowl chamber illustrated below.

This new feature, added to the many advantages the U. S. already has over all other types of separators, makes our 1914 model the most satisfactory one for your dairy-room.



The Sanitary Liner

Milk now never can touch the iron bowl chamber in the frame of a U. S. Separator. This sanitary liner is easily removed to wash with the other parts of the separating bowl. **It is non-rusting.** A unique but simple locking device holds it rigidly in the frame of the separator.

Ask Your Dealer for Our Catalog

The U. S. Cream Separator dealer in your locality will be glad to explain to you the features of this better separator. He will be pleased to place one in your dairy-room entirely at his and our risk—you take no chances. Test it thoroughly right in your own home under actual farm conditions.

Remember the U. S. Cream Separator holds the **World's Record** for **clean skimming** in **fifty** consecutive runs with **ten** different breeds of cows over a period of **thirty** days.

It requires about half the power of other separators and skims twice as fast.

Investigate the merits of the U. S. Cream Separator today. Send a postal today for our 1914 catalog.

What makes good concrete?

Concrete is good — depending mostly upon the quality and tensile strength of the cement. It's a simple matter to get clean sand, water and gravel. To get good cement is the vital thing in getting a good concrete job.

Look for high tensile strength, uniformity of color and fineness in your cement and you can't help but use

LEHIGH PORTLAND CEMENT

Our exclusive, scientific process imbues Lehigh with a tensile strength unusually high. This gives to the concrete increasing strength each year. Concrete structures built with Lehigh Cement grow stronger with age.

Our book, "The Modern Farmer," should be in your hands. It tells all about Lehigh Cement and gives full instructions for making concrete barn floors and other farm buildings.
We send it free

Lehigh Portland Cement Co.
301 Young Bldg., Allentown, Pa.
103 Consumers Bldg., Chicago, Ill.

A concrete barn floor is best. It is sanitary, easy to clean, lasts forever and needs no repairs. Build one. Use "Lehigh."

The Henyard.

The Daily or Alternate Layer.

I should like to learn from some of your men who know, why it is that in the heavy breeds of chickens, some hens lay every day and others only on alternate days, where both are yarded together and receive same treatment. Does the daily layer produce any more eggs in a year than the alternate, or does she lay off longer between spells of production? It would appear at first sight that the daily bird was the better, but is she?

Mobile, Ala. M. A. P.

We have here, of course, a great many individual records. I will give you a few isolated instances, but not enough, I believe, to warrant conclusions. I think I would like to add that the hen that lays every day of course is in a position to rest longer when she needs to.

I find that in our first laying contest we had a Buff Orpington from West Virginia that laid for 25 consecutive days, beginning March 20, which same individual laid 24 eggs in December, 28 in January, etc., and finished the year with a total production of 210. This is of course, not a despicable record by any means.

Coming to the second egg-laying contest, I find a Barred Rock from Pennsylvania that laid for 61 consecutive days beginning February 22. This bird laid only three eggs during the first three months, and yet finished the year with 206 to her credit. A Rhode Island Red from New Hampshire laid for 33 consecutive days, giving us 31 eggs in the month of August, and yielded 245 for the entire period. Another Red in this same pen produced 248 eggs for the year and her longer consecutive laying was over a period of 41 days.

The best individual production in the second contest as you know, of course, was a White Leghorn of Mr. Barron's that yielded 282 eggs. Her largest consecutive number according to our records is 17. To take some other examples: I find a Canadian White Wyandotte that laid regularly each alternate day through January and February and then followed very closely a schedule of laying two days and skipping one for the next three months and finished the year with 174. A White Wyandotte from Pennsylvania laid an average of 15 eggs each month from December to May, both included, yet this bird seemed to have no regular schedule. She would have brenks of anywhere from three days to a week without any production at all and at one time during this period laid no eggs for 16 days. She laid 188 eggs during the year.

A Rhode Island Red from this State followed very closely for about two months the program of producing two eggs and then skipping a day, yet she laid only 138 eggs and produced none at all in the last three months. A White Leghorn from Pennsylvania laid 178 eggs in 10 months, following very closely the rule of two days and skip one for about four months, two of these were at the beginning of the laying period and two months or a little more at the end. For the intervening time she followed very closely the program of laying three eggs and skipping a day, although this would vary a little, as for instance, in the month of June she laid five consecutive days before missing, and twice she laid four consecutive days without missing. During the month of July she laid four consecutive days and made up for this later in the month by laying only two consecutive days so that her average right through the month was three days and skip one. These are all actual facts, but just what they mean I am sure I don't know. They seem to indicate that the longest consecutive layers are not necessarily the heaviest producers at the end of the year, and yet if a bird is going to lay 300 eggs she has got to stay pretty close on the job.

W. F. KIRKPATRICK.

Poor Hatch of Ducks.

I had 500 dneks and 70 drakes, all running together. They hatched well till March; then the eggs began to rot. They tested fairly good, but the second and third week they began to rot badly. Do you consider the fault was in the feeding? I fed twice a day 1½ bushels bran, one-half bushel scrap with a few fish when we could get them; boil 10 to 20 minutes, add one bag cornmeal, which make a nice stiff mash. I use half in the morning, mixing thoroughly, one-half bushel whole corn, one-half bushel wheat and one bushel of green stuff, the same in the afternoon. I would like to know what ration you advise for baby ducks.

S. S.

It is a common thing among duck raisers to have poor hatches in their eggs under many conditions. It is sometimes found that certain makes of beef scrap produce much stronger germs than do other makes. Fresh meat and bone, cooked and ground, seem to give the best results. The very best grade of beef scrap should be used where this is not obtainable. The kind of green food has considerable to do with the strength of the germ, and nothing has been found better than clover or Alfalfa steamed. Of course the fault of the eggs rotting during the second and third weeks might very likely have been with the incubator, but it might be due to the fact that your ducks laid over 100 eggs each in nine months, and were probably somewhat lower in vitality (they could hardly help it) after several months of such continuous laying. The best hatching and brooding occurs when the breeding ducks have not been induced to lay much during the Fall and Winter, and are given water to swim in. A. L. C.

Poor Laying.

How could I make my hens lay more eggs? They have free access to a large rye field, and as they get to pick up silage, etc., at the barn (we keep a dairy) I also feed cane seed. I have about 175 hens. How much ought I feed and what? I get but about a dozen eggs per day and my chickens are healthy. How many roosters ought I keep? R. S. G.

One would infer from your letter that you are letting your hens run at large, and are feeding but one kind of grain to supplement what they pick up. Sorghum seed, which I take to be the cane seed to which you refer, has an analysis which would indicate a feeding value practically equivalent to corn. An exclusive diet of this would not supply the protein necessary for the production of eggs and you could hardly expect good Winter egg production without the addition of other grains and meat food in some form to the cane seed and green stuff which your hens are getting. If you can add such other grains as oats and wheat to their whole grain rations, and provide, in addition, a mash of ground grain to which beef scrap or meat meal is added, or give plenty of skim-milk, you may reasonably anticipate a better egg yield. Six vigorous males should be an ample supply for such a flock running on free range.

M. B. D.

Black on Duck's Bill.

Does the black on bills of White Pekin ducks disqualify them for show stock?

Newburgh, N. Y. J. T. F.

Black on the bill of a Pekin duck does not disqualify, but will cause a cut of one point if on the bean, or from one to one and a half if elsewhere on the bill. Black on the bill of a Pekin drake disqualifies. W. H. H.

Send for Free Booklet

FREE BOOK on How To Increase Cream Separator Profits

THIS is the most important and valuable dairy book printed for a long time—and it is absolutely free. It is important because it tells exactly how you are now losing cream and butter money every day by turning the crank of your cream separator at the wrong speed. It is a valuable book because it tells also how you can *save* all this cream and butter money by using the greatest dairy invention of the age—the

Stewart Speed Indicator for Cream Separators

The Stewart Speed Indicator is an instrument to be mounted on the crankshaft of your separator (see illustration). Its dial is marked from 1 to 65, and as you turn the crank this dial shows exactly how many revolutions per minute you are turning. You can then operate at the precise number of revolutions marked on the crankhandle. If you don't turn the handle correctly, then you are losing butter-fat and money.

Nels Anderson, Wisconsin, Writes:

"I have been using the Stewart Speed Indicator and my separator runs lots better. It skims better than it ever did. If I could not get one like it, I would not sell it for any price. Several of my neighbors have seen it and they think it about the best they have ever seen of its kind."

Tests made at Purdue Experiment Station showed that one dairyman with 20 cows lost $524.10 in one year by turning his separator crank the wrong speed—he guessed at it. Another dairyman with eight cows writes that he lost $18.50 *in one month* by guessing at the speed he turned his separator. No human being can turn the handle of his separator the right number of times unless he has a Stewart Speed Indicator, which shows him exactly the number of turns he is making to the minute.

Fits Any Separator—$10—30 Days Trial

No matter what make cream separator you own, the Stewart Speed Indicator will fit it. Just tell the name of your separator, its number, and the year it was made. The Stewart Speed Indicator will be furnished on a special shaft for that separator—all for $10. (If you own a De Laval, then no extra crankshaft is necessary). If it does not increase your cream production, send it back within 30 days and your money will be returned to you. Order from your dealer or direct from us.

Yes, sir, I want you, the man who is holding this paper in his hand right now to write me right away. I've got something special to offer you. I am making a special appeal to the readers of this great paper. Write me without fail for my catalogs and I will explain my new offer fully. I want you to get my catalogs, first, because they are the first step in our getting better acquainted in a business way on my direct from factory to farm, one-profit, money saving plan. My catalogs are my only salesmen, and they are the best and cheapest salesmen on earth. Get your copy without fail. My line of gasoline engines, manure spreaders, cream separators and my big general line of merchandise, everything for the farm, home and family, can't be beat in quality, and my direct from factory prices are the lowest. Think of it! A regular, guaranteed, high-grade 5 H. P. engine at only $99.50 and other sizes from 1¾ to 15 H. P. at correspondingly low prices. Get my catalog giving all the facts. I will mail you a copy **free,** postage prepaid. Write me today. Now!

Buy on My Direct From Factory Plan and Save $50 to $300

Depending on the size you buy. Put that money right back in your pocket. That's keeping your money at home better than any other way you can think of. Take your choice of any engine in my entire line. They are all designed especially for farm work. They are easy to run, easy to operate and use less fuel than any other engines made. They are built in sizes from 1 3-4 H. P. to 15 H. P. My Light Duty and Pumping Engines 1 3-4 and 2 1-4 H. P. sell from $26.75 up and ready to put right to work when you receive them. No extras to buy. You can equip your power plant with a Galloway Stationary engine at one-half the regular cost. My portable engines are all steel, durable machines, either hand or horse portable trucks. My Horse Portables include friction clutch pulley. Galloway saw rigs are built extra strong and extra safe. They are unequalled today. Yes, sir, you won't find a more complete or better built line of farm work engines on the market. **My Free Service Department** will aid you in selecting your equipment and in installing your engine. This service is absolutely free to the man who buys a Galloway and it will save you a lot of money and time. Get my catalog giving all the facts.

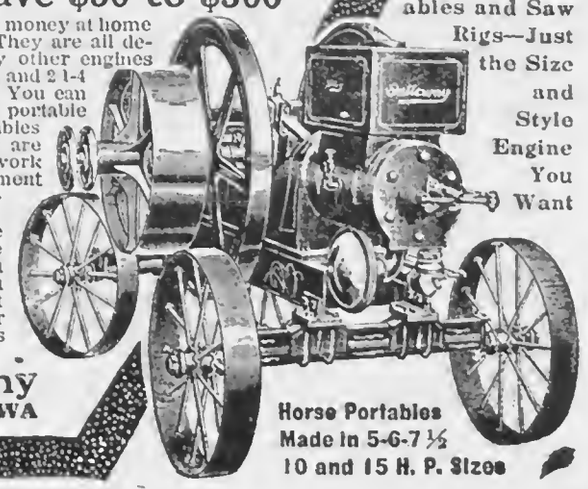
Get My New Special Offer

Write me today for my catalog, either my Big Complete Engine Book or my special Pumping Engine catalog, or both. They are FREE. When you write for my catalog I am going to make you the most liberal offer you ever heard of; an offer that will help you get your engine partly or entirely FREE to you in the end. No soliciting, no canvassing—just a straight business proposition. The most liberal co-operative, profit-sharing offer ever made. You should know all about it. Then write for my catalog, now, before you lay this paper down. Just address

William Galloway, President

William Galloway Company
275 Galloway Station, WATERLOO, IOWA

The Great Galloway Line Includes Stationary, Portables and Saw Rigs—Just the Size and Style Engine You Want



Horse Portables Made in 5-6-7½ 10 and 15 H. P. Sizes

PUBLISHER'S DESK

Will you give information regarding the Coal Lands Securities Company, of Scranton, Pa? F. H. P.

Massachusetts.

We have long tried to reach some intelligent understanding of the affairs of the bunch of Scranton financiers who dominate this and other concerns, issuing securities to the public, but we about give it up in despair. This coterie of financiers is headed by one T. J. Foster, whose son acquired some newspaper notoriety recently through an elopement with the young daughter of a New Jersey family. The girl finally returned to her home, and Foster was held by the authorities and if we remember rightly serious criminal allegations were pending against him.

In addition to the Coal Lands Securities Company the promoters referred to are the International Text Book Company; the Colliery Engineer Co.; the International Correspondence Schools; the Technical Supply Co.; the International Educational Publishing Co.; the International Correspondence Schools of London; the International Poultry Co.; Hoover Incubator Manufacturing Co.; and the International Poultry Sales Company. There may be others, but this is sufficient for the present. These financiers always deal in millions, and all of them are so intermixed and interwoven that we have not been able to tell where one begins or where the other leaves off.

Take the Poultry Company. A New Jersey farm of 241 acres was the foundation, and our information is that the price was around $15,000. It was put into the company for $100,000, and a financial structure of $500,000 in stock and $300,000 of bonds raised on the premises. Some chickens and equipment were added, and the assets figured at nearly a million. If we understand the complicated report, this whole business has now been taken over by the Hoover Incubator Mfg. Co., with a capital stock of $1,500,000; but whether there has been a new writing of securities since or another coming we know not. This 241-acre farm may or may not be worth a million and a half. The other concerns may be worth all the securities that are out against them, but we have not been able to satisfy ourselves that they are; and consequently we would not put our own money into them.

But we go a little further; we would not directly or even indirectly endorse them. Recently we refused a large order for advertising the Scranton Correspondence Schools, because if we advertised them we would give direct endorsement of their methods of securing scholarship contracts, which we could not and do not approve. Besides this, we would indirectly endorse these financial propositions, and as seen above we have been unable to do that. The representative of the company asserted that THE R. N.-Y. was the only paper that refused the advertising, and it is a fact that many, if not all the others, do carry the advertising at one time or another.

What is the commercial rating, reliability, etc., of the Exchange Corporation of Lackawanna, N. Y., a firm selling silos, seeds, etc.? E. C. C.

The Exchange Corporation, Lackawanna, N. Y., is no doubt the same concern that R. N.-Y. readers have known as Equitable Audit Co. of that place, promoted by J. W. Woodruff of American Farms Co., formerly of Buffalo, N. Y. More recently Mr. Woodruff has been operating from Columbus, Ohio, under the title of Universal Exchange Corporation. Last season he promoted a scheme to build a silo factory at Hampton, N. J. A number of people in that community subscribed to stock before learning the history of Mr. Woodruff's previous promotion schemes. A trail of complaints and trouble have followed Mr. Woodruff and his silos wherever we have heard of them.

Referring to your correspondent who has had goods mailed to him which were neither ordered nor wanted, it is useless to write to the Postoffice Department about this variety of fraud, as it advises you to refuse to receive the mail, which is obviously impossible as one does not know what it is until he opens the package. So the remedy is to rewrap the article, address it to the sender, take it to the express office when convenient and ship by express, collect, taking and preserving the express company's receipt for it. Pay no attention to threatening letters. If litigation is started the express receipt ends it, and the schemers must pay the express. H. F.

This is a good suggestion. The practice of sending cheap goods by mail to country people, without order or suggestion, and then demanding pay, has got to be a nuisance. Of course, the threat to sue on such accounts is pure bluff, but the experience is annoying to say the least. No one wants threatening letters fired at them by a collection agency, even when there is no legitimate account to collect. The practice is followed by purveyors of cheap razors, cheap perfumery concerns, and I am sorry to say by cheap farm papers. The papers send a bunch of cards or other premiums, and then place the account for collection with a browbeating collection agency. The suggestion in the above letter is the best we have yet seen for the treatment of such cases. Return the stuff promptly by express, marked collect, and pay no attention to threatening letters.

Last Spring I purchased an incubator from Charles Cyphers, known as the Buffalo Big 4, capacity 1,260 eggs. He sent his printed matter to me recommending this machine. I purchased a machine, paid him $60 for same in advance. This machine is not worth a lead dollar as a hatcher. We cannot regulate it at all, and he could not himself. Now I wrote him a number of times and cannot get a reply from him. Last Summer he wrote he would exchange other machines for it and take it back at his leisure, but since has refused to answer. Please take the matter up and let me hear through your paper. G. W. B.

Mr. C. A. Cyphers has been conspicuous as an incubator manufacturer for a good many years, and more lately as a promoter of various enterprises at Buffalo, N. Y., including a poultry establishment in which he sold stock to the public. The poultry project has since gone out of existence. It is Mr. Cyphers' contention that these incubators were sold without any guarantee expressed or implied, and therefore he is under no obligation to the purchaser to take the machine back and refund the purchase price. He admits, however, that as many as 10 purchasers of the incubator did not get what might be considered fair results, so that poultrymen can draw their own conclusions as to their prospects for success with machines put out by Mr. Cyphers under the name of the Buffalo Incubator Company.

December 24 we received check for $64.50 from Adams Express Company, the full value of the corn shipped to New York last July. We thank you very much for the part you have taken in it and enclose a year's subscription to your valuable paper. H. D. W.

Through some carelessness the car containing this corn was run off the regular track and left standing on the siding so that the shipment did not reach New York until it was spoiled and also too late for the market. The claim as entered by the subscriber was allowed to drag, and he could get no advice as to why it was not adjusted. Some smaller claims were settled, but the larger ones were overlooked. Five weeks after we took it up settlement was made. J. J. D.

ATLAS

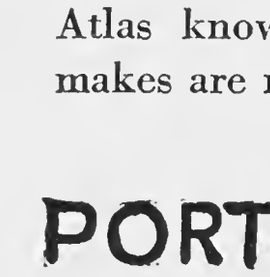
Drawn from a Photograph

While you're cross-breeding for a 300 egg hen, don't forget that all hens are more productive if kept in clean, sanitary quarters. An Atlas Cement concrete chicken house is the wisest solution.

Other cement may be offered you "just as good as Atlas," an indication of the quality which has made Atlas known as "the Standard by which all other makes are measured."

PORTLAND ATLAS CEMENT

Shall we send you free book about
APPLETON
WOOD SAWS
It shows pictures of all our buzz, drag, circular log saws and portable wood sawing rigs, with or without Appleton Gasoline Engines. Tells you straight facts which we guarantee our saws to back up. Opens a way for you to make money this Winter sawing your own and your neighbors' wood. You want a saw to last—made strong—boxes that never heat—don't experiment with cheap saws then, buy an Appleton, 40 years the standard. Send for booklet to-day. Batavia, Ill., U.S.A.
APPLETON MFG. CO. 627 Fargo St.



Three Gallons a Minute
flowing from a stream, artesian well or spring operates a RIFE RAM pumping all the time sufficient water for house or farm use. Costs little to install, requires no attention—no operating expense.

RIFE ENGINE CO., 2429 Trinity Bldg., New York

REAP A LUMBER CROP

Why not take a crop of lumber off the farm this winter? It's there, in your wood lot—and in your neighbors'—waiting to be harvested. You have the time, the team and the engine. All you need buy is an inexpensive "American" Saw Mill. You can run it yourself, and make good lumber for a new house, a new barn, or for the market. Lumber prices are high. Good lumber is in demand. There's big profit in working wood lot timber with an "American" Mill because it does so much at so little cost. An 8 H. P. engine will cut up to 2500 feet a day. When you've cleared your wood lot, go to your neighbor. Saw his lumber for him and share his profits. You ought to know all about this farm lumbering business. Ask us for our new book No. 26—the book that tells. Write nearest office now, while interested.

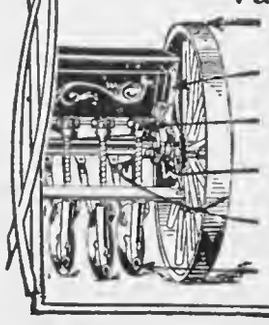
Bigger Crops-Better Grain-Less Seed
VAN BRUNT DRILLS

Famous for accurate feed, correct covering, light draft, light weight and durability.



These features made Van Brunt famous
Wheels always stand true.
Hopper trussed—don't sag.
Adjustable gate force feed.
Bearings extend under frame.
Adjustable spring pressure.
Every seed at bottom of furrow.

Every grain grower should investigate the new and improved features of Van Brunt drills. The adjustable gate force feed, the successful fertilizer feed, the non-chokeable disc openers, the trussed hoppers, the light weight, the light draft,—all of these features combine to make the Van Brunt famous wherever introduced. Don't seed another crop with a poor drill.

Book Free

Every grain grower should have our new drill book. The improved features of Van Brunt drills make them most desirable. Write and ask for package No. VB 33

Turkeys	28	@	32

Breaking Up a Broody Hen.

Can you tell me the most approved method of "breaking up" a broody hen—a Rhode Island Red for instance? Scientific poultrymen must have improved over the old method of imprisonment or a cold ducking. Should the patient be well fed or starved? L. J. S.
Connecticut.

There are probably few things that could more quickly put a crimp into "science" than the attempt to break up broodiness in some hens. My own method is to remove the broody hen to roomy and comfortable quarters where there are no nests or places to make them. A small, open-front shed guarded by poultry netting and fitted with perches serves my purpose. Here the broody ones stay, with plenty of water and food until they stop clucking, when they are put back into the poultry house. The signal to return them is frequently given by an egg upon the floor. In their new quarters my Leghorns do not attempt to sit, and it is usually only a matter of a few days before they can be trusted to go back to their jobs. Many poultry houses are provided with boxes having slatted fronts and bottoms nailed up against the wall in some convenient place. Here the broody hen is confined until her dreams of raising a family are forgotten, or at least, foregone. Starving isn't necessary, and the cold ducking should be administered, if at all, to the owner. He is usually the one who needs cooling off when he finds his layers sitting. A complete change of environment, with humane care, will probably accomplish the desired end as quickly as it can be done, and the more promptly this is brought about when signs of broodiness supervene the more satisfactory will be the results. M. B. D.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

FOR SALE—Small poultry farm near two large cities; house and poultry houses new; gas, trolley and telephone; acreage to suit purchaser. Address A. S. L., care R. N.-Y., 333 West 30th St., New York.

171 ACRES—Farm and orchard, bearing 1,250 five-year-old peach trees; 500 two-year-old apple trees; 40 acres cleared; balance in timber. Price, $2,000. W. E. BEATY, Romney, W. Va.

EXCHANGE—A choice residential property in Montclair, N. J., valued at $30,000; will exchange all or part for desirable, well-improved farm in northern New Jersey. OWNER, care R. N.-Y., 333 West 30th St., New York.

WILL DIVIDE MY FARM OF 250 ACRES—150 acres with three barns, house, hog house, 250 bearing apple trees, 30 acres woods, at $45; or 100 acres without buildings at $35. Enquire T. S. PAGE, Cohocton, R. 3, New York.

FOR SALE—90 acres Dairy and Truck Farm, with dairy and equipment; located 2¼ miles from city limits and Ohio State University, Columbus, Ohio. Posession to suit buyer; a rare opportunity. Address OWNER, BROCK-CREST FARM, Station A, Route 5, Columbus, Ohio.

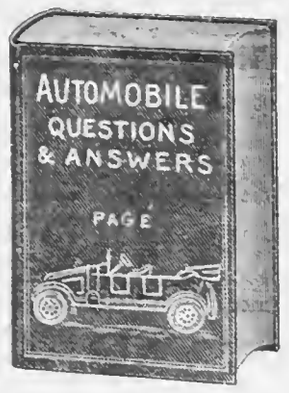
FINE OLD HOMESTEAD FARM of a hundred acres, in high state of cultivation, for sale to close estate; first-class land, never abused; nearly level; fine house in perfect condition; good barns; big silo; plenty water and fruit. Well located between cities of Rome and Ouelda, N. Y.; less than three miles to good town with high school and main line N. Y. Central R.R. Price $7,500. Only half cash required. J. H. FORT, Stone Building Oneida, N. Y.

Some Useful Farm Books

THE MODERN GAS TRACTOR. Its construction, utility, operation and repair. By Victor W. Page. 5¼ x 7½. Cl. 475 pp. 204 ills. 3 folding plates.

The latest and most complete work published on farm tractors and tractor power plants; treating exhaustively on their design and construction, and giving complete instructions on their care, operation and repair. It describes all ignition systems, all types of vaporizers and carburetors, latest forms of power plants and installations, clutches, speed changing and reversing gears, all frame parts and their functions, and every recent improvement in tractor and auxiliary appliances. All types and sizes of gasoline, kerosene and oil tractors are fully described. Every phase of traction engineering practice is fully covered.

QUESTIONS AND ANSWERS RELATING TO MODERN AUTOMOBILE DESIGN, CONSTRUCTION AND REPAIR. By Victor W. Page.



This practical treatise consists of a series of thirty-six lessons, covering with nearly 2,000 questions and their answers—the automobile, its construction, operation and repair. The subject matter is absolutely correct and explained in simple language. A popular work at a popular price. Answers every question you may ask relating to the modern automobile. 622 pages. 350 illustrations.

Either of the above two books will be sent postpaid for

Stottville, N. Y., May 28, 1913.

Dear Sirs:

I received my Unito Handy Garden Plow today, and I am well pleased with the same.

Mr. SAMUEL KNOTT.

Norwich, N. Y., March 24, 1913.

Gentlemen:

Last season I painted my house, and before ordering my paint, I looked up prices here at home, consulting three or four dealers, and found their prices to range from 50 to 75 cents higher than yours; therefore, I ordered from you the Unito Paint with which I am much pleased.

I have watched closely through the winter, and I find it stands the weather good, neither chalks nor scales like some other paints. Should order from you again if I needed more paint.

MOTT W. STANTON.

N. Duxbury, Mass., Oct. 11, 1913.

Gentlemen:

Have used quite a little of your goods and find they prove perfectly satisfactory. Will give you an order later of 5 ft. fencing, as I intend rearding my poultry with your wire, of which I have used already one 20-rod roll, and which I find ahead of other wires I have used.

Yours,

WM. F. SCHOLPP.

Dekalb Jct., N. Y., June 17, 1913.

Gentlemen:

The engine you shipped me is O. K. in every respect; will do more than you claim for it. If I hear of any one that is in need of an engine I will notify you. WM. CASSAW.

Brookfield, N. Y., July 16, 1913.

Gentlemen:

My painter was well pleased with your House Paints, so much so that he asked me to send in an order for him.

Fraternally yours,

J. D. CAMENGA.

Berkely Springs, W. Va., Feb. 6, 1913.

Gentlemen:

Your catalog is all right and nicely arranged; good paper; the plan is O. K.

J. W. BUZZARD.

THE NEW WAY To Buy By Mail

SEE The Goods Before You Pay

GEO. A. BOTTGER
President of The United Factories Company and originator of the plan to let you SEE and TRY the goods BEFORE YOU PAY.

[15]

TRY Them 30 Days BEFORE YOU PAY—

I want to send you this big Free catalog—postpaid. It explains how you can buy Ready Roofing, Metal Roofing, Barn Paint, House Paint, Fencing, Cream Separators, Incubators, Garden and Farm Implements, Sprayers, Harness, Buggies, Wagons, Gasoline Engines, Furniture, Pianos, Sewing Machines, Ranges, Wallboard, Shingles, all of which are sent direct from our factories company at a big saving. You don't have to pay one penny until you have seen the goods, examined them, and are satisfied with your purchase. I will positively ship any article listed in our big factories catalog, to any responsible person anywhere in the United States.

NO C. O. D.—NO DEPOSIT—NO PAPERS TO SIGN—

Just write for the catalog—find out about our plan—order what you want, on the most favorable terms ever offered.

We combine the products of 33 big Factories who have cut the cost to save you money. In addition to letting you see the goods and try them—we guarantee every purchase.

Nothing like this offer was ever made before. You cannot lose one penny. ***You take no risk.*** There is no chance for dissatisfaction. All expense, if no sale, is shouldered by us. We don't ask you to take a single risk.

If you want dependable merchandise such as we can furnish—the savings on which will surprise you, write today for

This New Free Catalog

Ready Roofing

All wool felt—heavily coated with mineral asphalt—waterproof and leak-proof. Complete with nails and cement, only

90c Per Roll

Each Roll Covers 100 Sq. Feet

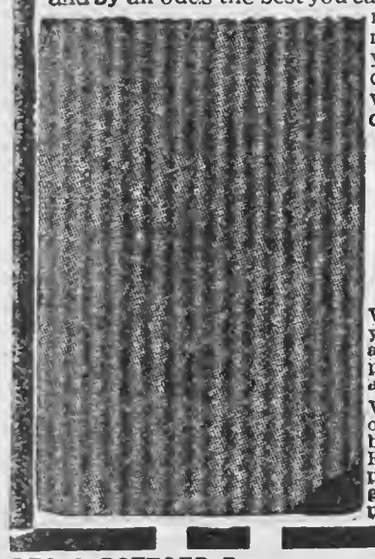
WRITE FOR SAMPLES

Give us an idea of what you want and we will send you samples FREE so you can test them before ordering.

Price Reduced on Metal Roofing

NO RUST—NO ROT—NO LEAK

Excell Galvanized Roofing is the highest grade and by all odds the best you can buy. Easy to lay, requires no tools, no experience. If you want a roof you can depend upon, what you need is a quantity of our



EXCELL METAL ROOFING

We can also furnish you with wall board, asphalt shingles and painted Metal Roofing at surprising prices. Write for **FREE SAMPLES** of roofing and wall board, and get our big Factories Catalog explaining our "See-the-goods - before - you-pay" plan.

PAINT BEFORE YOU PAY

Write for color cards and our Paint Book free. Find out about the now way to buy paint by mail.

UNITO PAINT is fully guaranteed—open it up and try it. Give it any fair test—if not satisfactory it's our paint—and you are not out a penny.

Barn Paint 70c Per Gallon

Others in proportion.

Both Incubator and Brooder

135 Egg Incubator

$9.45 30 Days' Trial

Incubator has hot water heat, big chick nursery, Tycos thermometer. Made of Select California Redwood covered with galvanized iron. Write for catalog and get full description.

Try the UNITO Cream Separator 30 Days

See the Cream Separator before you pay—use it 30 days. Compare the work it will do with any separator made. Our factory prices

$19.85 and up

Full description of this great labor-saving device will be found in our Factories catalog—sent free—postpaid. Fill out the coupon and mail it to us. We guarantee Unito Separators to get all the cream; easy to run and well made.

FARM TOOLS

$2.75

This Unito Cultivator at $2.75 is a big bargain. We have many others just as good. Write for catalog and find out about them.

FENCING

We quote only dependable fencing of best quality. Fully guaranteed.

13½c A ROD AND UP

Stay wires are strong, top and bottom wires extra heavy. Double galvanized—cannot rust. We can supply just the kind of fencing or gates you need. Write for the catalog.

TEST UNITO BUGGIES

$39.95 and up Order One

See Before You Buy — Try It 30 Days

Give it all the tests we recommend. Look it over, ride in it. You will find that we can save you a lot of money. Write for the big catalog for description and prices.

$4.80 See Before You Pay

Try It 30 Days

This beautiful Oak Rocker upholstered in leatherette sent on 30 days trial to show you a sample of our furniture line. If satisfied after 30 days pay us only $4.80. Write for catalog showing complete line.

SEE THE UNITO HARNESS

$10.98

Don't buy a harness till you have tried the famous Unito make. If satisfied only $10.98 for this single strap, breast collar buggy harness. It is a wonder for the money. See catalog for complete description.

Write for Free Book To-day

Find out about our plan. Mark in the coupon the articles you want to know about and send it to us. We will tell you how to order them, let you see the goods you order and try them 30 days. We will not ask you to sign any papers or make any deposits. All we ask is an opportunity to show you that we can save you money and that you do not have to risk one cent or keep the articles you order unless satisfactory in every respect. Fill out the coupon today.

FRUIT GROWERS ARE PROSPEROUS AND INDEPENDENT

Is there a paying orchard on your farm? If not, let these facts sink in: **Fruit growers have more money than general farmers. They don't have to work so hard.** We can prove to your entire satisfaction that these statements are true.

A one-acre apple orchard should yield 100 bushels when the trees are four years old, 200 bushels when five years old, 1,000 bushels when ten years old. The average cost of apples in properly handled commercial orchards, including marketing in boxes, is less than 70 cents a bushel. The selling price of good apples is $1.25 to $2 a bushel box.

The net profit on two good crops from one acre of apple orchard will buy an automobile. Three apple trees give more profit than an acre of potatoes. Two apple trees give more profit than an acre of corn. One apple tree gives more profit than an acre of hay. Is there any reason why you should raise hay and grain and potatoes, and no apples?

Don't Waste Your Time on Your Grandfather's Trees

The president of a big corporation said that their scrapheap was the most valuable department they had—it contained dozens of good machines that were thrown away because they were not so good as the ones that replaced them.

If you have an old apple orchard, you may profit by acting upon the scrap pile idea. But you don't need to throw away your old trees. Let them do their poor best for a few years yet, and plant a new and better apple orchard this Spring.

Old apple orchards seldom yield half what properly grown and cared for ten-year-old trees will. They usually contain a medley of varieties—odd sorts not in demand today. Your grandfather's best apples are not best now. Plant the varieties that will be popular when your trees bear. If you give such trees good care, $100 an acre each year is the smallest net return you may expect.

Grow Apples That Sell Direct to Consumers

City people have learned that they can buy apples by the bushel box direct from orchardists. By doing this they get finer apples, in better condition. The cost, delivered by express, is less than retail grocers charge for inferior fruit, even when $2 to $3.50 is paid for apples in the orchards.

You can net $2 or more a bushel for all the flawless apples you grow if you will pack them right and if you **grow the right varieties.** For this purpose grow Stayman, McIntosh, Baldwin, Jonathan, M. B. Twig, Rome Beauty and Winesap. This is a look ahead for your benefit. If you are prepared to give your orchard and fruit first-class care, you can make a lot of money by planting an orchard to grow fruit for this demand.

Grow Apples That Are Good for Baking

The custom of baking apples has increased during the past few years fully ten times over. Restaurants and hotels cannot get enough of the apples **that bake well.** This demand will continue to increase because the baking of apples is based on a sound and wholesome idea.

Only a few varieties do bake **well.** The best are Baldwin, York Imperial, Stark, Gano, Ben Davis and Rome Beauty. These sorts bear heavily and regularly. They succeed with ordinary care, and some or all of them are at home from New England to Missouri and Georgia. The trees should begin to bear at six or seven years old, and if sprayed properly should net more than $100 an acre after the tenth year.

USE THIS COUPON—IT'S AS GOOD AS A LETTER

HARRISONS' NURSERIES, Berlin, Md.

Please send me your new Catalog of Fruit and Ornamental Trees. I expect to plant

I shall need about ..... of the plants marked.

My name .....

My address .....

Plant Only Trees That Are RIGHT

If you give your orchard good varieties, good soil, water and air drainage, and proper care, it will produce surely and promptly the fruit and the profit you expect—unless the trees fail you.

But what about the trees? How do you know they are true to name and will bear heavily? What if they should not prove to be Stayman or Baldwin or York Imperial as planned, but worthless varieties or even worthless seedlings? What if they should turn out to be apple trees that refuse to bear well, no matter what attention they get?

Your only protection against this source of failure is to buy trees from a nursery that has its trees bear RIGHT. This nursery must be square enough to stand back of its trees till they bear. It must do a business big enough, and must be worth enough financially, to make its guarantee as good as a well endorsed note. With anything less than this, you take a needless, useless risk, and it is you who lose if the trees are wrong.

J. G. Harrison

Orlando Harrison

G. A. Harrison

G. Hale Harrison

The way to be safe and to have a successful orchard is to plant Harrison trees. These trees are larger, straighter and smoother than most others. They are absolutely hardy in all apple sections. They are budded from bearing orchards. We sell only trees we grow ourselves, and to grow them well we employ more practical orchard men than any other firm in America. The Harrison Nurseries are the largest in the world. The Harrison trees are absolutely guaranteed, and are RIGHT. Few other trees equal them in looks, in growing or in bearing.

Ask Our Orchard Men What to Plant

If you are puzzled about varieties or any other orchard matter, put it up to our experts. The North requires one set of varieties, the Middle States another set, the South another; and low-land sorts are not the same as thrive in mountain sections. Tell us where you live and what your land is like. We will tell you what to plant.

We have men whom we sometimes send to oversee or manage the planting of large orchards for our customers. If you would like to consult with one of these men, please take the matter up with us and it likely can be arranged. Our twenty years of experience in orcharding is behind the services you will get in this way.

Make Your Home Beautiful With Harrison Shade Trees and Evergreens

Next to planting an orchard on your place, nothing will raise its value so much or increase its desirability as a home more than planting shade trees, evergreen and other handsome plants. We tell how to plant about your home in our landscape book, "*The Why and How of Shade Trees and Evergreens.*" This book is sent on request.

Our 1914 Catalog is One of the Most Valuable Ever Issued

It tells how we grow trees and fruit so well, describes good varieties, and gives planting plans and directions. Read the story of how we saved a crop of peaches and got $35,000.00 worth of fruit from about a hundred acres of our orchards here at Berlin. The net profit was more than $25,000.00, or about $250 an acre. This is one of the best examples we ever saw of how the enemies of peaches can be controlled absolutely by spraying. It shows also how much peach trees can be made yield, and how much profit peaches will make. You should read the full details of spraying, cultivating, fertilizing and marketing. No other nursery book published is more valuable. It is sent on request. Our complete fruit grower's guide book, "*How to Grow and Market Fruit,*" is sent postpaid for 50 cents, and that amount rebated when you send us a $5 order.

Come to Berlin—See Our Nurseries and Orchards

In no other way can you become acquainted with the largest nurseries in the world, or with our advanced methods of growing fruit. Come and pick out your own trees in the Nursery blocks. Without obligating you in the least, we will pay your hotel bill in Berlin.

WRITE TODAY, ASK QUESTIONS OF OUR EXPERTS, and tell us about your planting plans and aims

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4245. NEW YORK, MARCH 7, 1914. WEEKLY $1.00 PER YEAR.

UNCLE SAM AS A FRUIT JUDGE.

Identifying Unknown Varieties.

Many readers have asked us about the work at the Department of Agriculture, in identifying fruit varieties. The U. S. Pomologist has become much like the Supreme Court in his decisions in matters of this kind. There are many disputes about varieties, both between buyer and seller of the fruit, and also with nurserymen when the trees come into bearing. There is so much interest in this, that we asked Prof. Close, the Pomologist, to give us an informal statement about his work. What follows is standard, and should be kept by all those who are interested in the matter.

I take pleasure in telling you something about the fruit identification work in the United States Department of Agriculture. We receive fruits of all kinds for identification, testing, etc., from nearly all sections of the United States where fruit is grown, and the work of identification is increasing year by year as people learn that our office is really a fruit-naming clearing house, and we identify fruits free of charge. Apples are received every week in the year, and form the bulk of the identification work. October is the month of heaviest receipts, and often more than one hundred mailing boxes of fruit are received per day during the rush season.

EQUIPMENT FOR IDENTIFYING VARIETIES.—This office contains a vast amount of water-color paintings, variety descriptions, records, reference books and fruit models to aid in this work. Back of all this equipment must be a wide knowledge of varieties throughout the country, and a discerning eye to detect the most minute characteristics of difference or similarity in the specimens at hand. Allowance must be made for varietal variations caused by sectional environment, such as range in temperature, amount of rainfall and sunshine, elevation, etc. It is seldom safe to depend upon the external appearance only, for this varies more than the internal structure, as can be shown by our water-color paintings of cross sections of fruits.

THE GOVERNMENT'S SHARE.—Mailing boxes and postal franks are sent to anyone who desires to forward fruits to us for any purpose whatsoever; thus the fruit grower is at no expense in this respect. After the fruits have been critically examined, inside and outside, the fruit grower is given the names of the varieties recognized. We are unable to name all varieties sent in, but a large portion of these we believe to be seedlings.

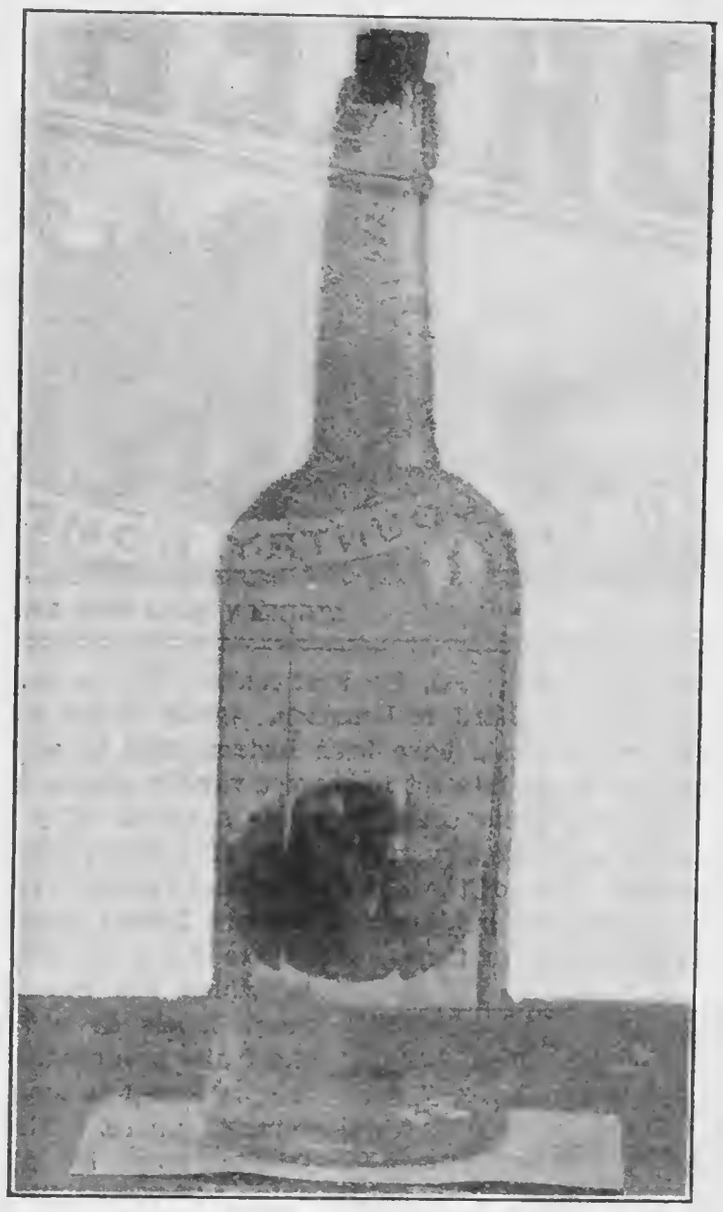
WHO SENDS THE FRUIT AND WHY.—The general spread of agricultural education throughout the land, the great activity in land sales, the recognition of a vast fruit-growing industry, the recent apple craze, and the desire for a more intimate knowledge of what the farm is growing, seem to have caused both the old owners and the new owners to wish for true variety names, especially where neglected orchards are being reclaimed. The bulk of fruit for identification undoubtedly comes from these once neglected orchards. When the old orchards were planted, nearly every variety available was included, and as time passed the names became forgotten or lost. The correct naming of varieties now goes hand-in-hand with the rejuvenating of old orchards, and with middle-aged and young orchards, too, for that matter, and is really a part of orchard reclamation. Some of the agricultural journals have been instrumental in awakening a lively interest in correct variety names, and many specimens come to us as a result of press notices that the Government identifies fruits free of charge. Most of the State Experiment stations send in their fruit puzzles, and we are indeed glad to be of service to them. There are not a few cases in which the nurserymen's labels do not fit the fruits produced, and we are asked to supply correct names. These misfits may be anything within or without the long list of varieties offered for sale. The so-called Sulzer law establishing the Federal standard barrel and standard grades for apples when packed in barrels, makes it absolutely necessary for fruit growers to *know* their varieties if they wish to conform to this law in packing for interstate shipment. A few varieties have already been identified for this purpose.

IN BLOSSOM TIME.

AMOUNT OF FRUIT FOR IDENTIFICATION.—During the year 1913 nearly 4,000 lots of fruit, representing perhaps 18,000 specimens, were received for identification. Each of these lots is a distinct variety, but this does not mean that there were 4,000 different varieties, because many of the varieties were received two or more times. There were, however, more than 300 varieties of peaches for identification and verification. Besides all of this material we received hundreds of specimens for examination, testing, etc., a good many of these being seedlings.

VARIETIES OF APPLES RECEIVED OFTENEST.—It is interesting to know that during the last four months of 1913 there were 280 different varieties of apples received. Among these were some of the very old kinds like Water, Michael Henry Pippin, Cornish Gillyflower, Herefordshire and others whose names are seldom heard now. Strange as it may seem, the most common varieties are apparently least well known: at any rate, they are received here oftener than the others, but this is because they are more widely planted. The varieties received oftenest and number of times received during September, October, November and Decem-

ber, in 1913, are as follows: Rhode Island Greening, 57; Baldwin, 55; Tompkins King, 50; Ben Davis, 40; Hubbardston, 38; Stark, 37; Jonathan, Wagener and Wealthy, each 32; Rome Beauty, 31;



APPLE IN CAPTIVITY.

Pewaukee and York Imperial, each 29; Northern Spy, 26; Gravenstein, 24; Dominie, Sutton and Walbridge, each 23; Grimes, Tolman and Willow, each 18; Shiawassee and Smith Cider, each 17; Fallawater and Winesap, each 16; Milam, Northwestern and Pennock, each 15; Alexander, Esopus, Gano, Lankford, Longfield, Paragon, Winter Paradise and Yellow Newton, each 14; Akin, Bailey, Famense, Missouri, Rambo, Swaar and Wolf River, each 13; Cooper Market, Fall Pippin, McAfee, Mann and Salome, each 12. The list of varieties received less than a dozen times is too long to be given here.

WHAT PEOPLE SEND.—From the specimens some people send they must think we are wizards able to name any fruit, no matter how much disguised, misshapen, rotten, wormy, or runty. Not much time is wasted on such poor material, for it might be anything, and isn't worth risking even a guess on. Sometimes only a part of a fruit is sent, or an incomplete description, and in one instance recently *four* apple leaves and *two* seeds—what a chance for a guessing contest! We appreciate this confidence placed in our ability, but even a Government official has his limitations. Most of the fruits, however, are of typical size, shape, and color, and this we appreciate fully.

FREAK FRUITS.—Only a few freaks have been received in the past two years, but occasionally someone makes a remarkable discovery of a wonderful new seedless apple and sends it to us. These are as worthless as the 57 other seedless kinds which have gone to their rest.

WHAT IS A SEEDLING?—A good many statements like this reach us: "I am sending specimens of a seedling apple; what is the name of it?" or, "I am sending samples of a seedling apple from a wild tree which father dug in the woods a few years ago. What is the name of this variety? Please place description of this over our signature in your year book." Sometimes the good old varieties are sent in as seedlings; this is done in good faith in the belief that the tree was never grafted or budded. Much of this confusion doubtless arises from a misunderstanding of what a seedling is, and from the fact that nearly all named varieties were once seedlings. Our understanding of a seedling apple tree is that it is one grown from an apple seed. It remains a seedling until it is given a variety name, and it really should be propagated and offered to the trade before it graduates from the seedling class into the named variety class. This holds good with all kinds of fruit.

LESSONS LEARNED.—The two most important lessons to us from this work are the variations of the same variety in different sections of the country, and the adaptability of varieties to the various fruit-producing areas. These subjects are too big to discuss here except to give a couple of examples of the first one. In general the apple varieties of the Pacific Coast States are large in size, elongated in shape, ribbed at the blossom end, very brilliant in color, and of a fine polishable finish. Those of the Rocky Mountain region are not as large nor long, but have the same color and finish. In the Great Plains States and eastward they are still shorter, usually not so brilliant in color and not quite so fine in finish. The Elberta peach is a good example of sectional variation. In the Southern peach districts it is flattened with considerable tip. In the central, northern and eastern sections it loses most of its tip, is oval in outline with sides compressed. In the Rocky Mountain region and westward it is larger and globular in shape.

Some one is wondering what we learn about the quality of apples as grown over this great country. We know that *good* apples, *splendid* apples, come from every apple section, and that there are twenty million opinions as to where the *very best* ones are grown. Not one of the twenty million opinions wants to be changed; they are probably all correct anyway, and, furthermore, an opinion changed against its will remains of the same opinion still.

CONCLUSION.—I hope this long letter covers some of the points you wish for your readers. We are always ready to identify fruits for anyone, and will furnish horticultural information whenever it is desired. We send mailing boxes and franks upon request so that fruits may be forwarded without the payment of postage. We desire three or four typical fruits or clusters of each variety, together with a statement of the age, size, and habits of the tree, bush or vine, and also the local name, if one is known. An important point is that the sender's name and address should be either inside or outside the mailing box. A few mailing boxes reach us without a mark of any kind to indicate who sent them, or at what post office they were mailed.

C. P. CLOSE,
Pomologist.

SIZE OF PEACHES AFFECTED BY WEATHER

The Winter and early Spring of 1912-1913 was remarkable because of the abnormal weather conditions which prevailed. Unusually warm weather occurred during the Winter months, which caused the flower buds of fruit trees to swell and commence growth. No extremely low temperatures prevailed in New Jersey at any time during the Winter. As a result of the high temperatures all fruit trees bloomed many days earlier than is the case following a normal Winter.

Upon May 11, at New Brunswick, N. J., sour cherries had developed to the size of green peas; peaches were as large as small walnuts, and apples were a half-inch or more in diameter. During the night of May 11-12 the temperature reached a minimum of 31 degrees and remained at this point for two hours. None of the fruits above mentioned was injured seriously as far as could be determined by observations, at that time. Low temperatures also prevailed at other times which were certainly unfavorable to fruit development. As the various varieties of peaches began to ripen, it was quite generally noted that some specimens were unusually large in size; much larger than other specimens upon the same tree in fact, which were really the normal specimens. A close examination of the unusually large specimens at ripening time showed that the dots or lenticels were much enlarged.

Artificial girdling of a branch will result in an increased size of the fruit due to the check to the wood growth of the treated branch, and the cutting o of the downward flow of sap toward the roots. Winter injury to a branch at a certain point may interfere with the downward flow of sap in such a way as to cause an enlargement of the fruit similar to that introduced by artificial girdling. Injury to twigs of peach undoubtedly occurred early last Spring during the cold weather, which affected the downward flow of sap in such a manner as to result in abnormally large specimens of fruit in numerous instances. Small and sometimes more or less shriveled specimens were also numerous, even in the late Summer, and often occurred upon trees which also bore abnormally large specimens, as illustrated in next column.

It was a puzzle at first to account for such fruits. Imperfectly pollinated peaches commonly fall from the trees in June, instead of persisting upon the branches, as did these fruits. A study of the matter finally revealed the fact, however, that the stem of the peach itself which connects it with the branch had been injured by the cold sufficiently to prevent a good circulation of sap into the fruit. The injury was not sufficient to completely shut off the circulation, however, which would have caused the fruit to fall from the twig. Some of these smaller specimens remained upon the trees several weeks after the normal fruits had ripened. The only difference in the condition which caused the very small peaches and the abnormally large ones was the point at which the injury occurred in each case; or in other words, whether it occurred to the stem of the peach itself or to the twig upon which the peach was borne.

M. A. BLAKE.
New Jersey Experiment Station.

THE APPLE IN THE BOTTLE.

We have no doubt many of our readers have seen at fairs and fruit expositions the remarkable spectacle of a big apple growing inside of a comparatively small bottle. Usually these bottles have a very small neck, but a larger body, so that an object of some size can stay therein. It is usually a great puzzle to those who have never seen the trick done to know how this big fruit could ever be pushed through the narrow neck. Like everything else, however, this is easy when you know how. The picture opposite shows one of these specimens, and the following note will tell how it is done.

One of my boys placed the apple inside the bottle last Spring, when small, and tied the bottle fast to the limb of the tree. It is a Spice apple. The bottle is a short quart. After having it photographed he sold it to a druggist for 50 cents, who placed it in his show window where many who saw it said: "How did it get inside the bottle?" That is the highest price we ever received for one apple.

S. E. RHINE.
Ohio.

This is a good experiment for some of our boys to try this coming season. We would from choice take a bottle with a small neck, and with a body large enough to permit the growth of good-sized fruit within it. Take some Winter apple, one that will keep for a long time. Be careful to introduce the limb and small fruit so as not to bruise it, and watch it carefully through the season. The boy who can do this will find himself something of a wizard or horticultural hero when he goes to the county fair.

Another well known trick is to put pieces of paper over the apple before it colors, with the letters cut out so as to do a little sun-printing upon the fruit. Where the paper covers the fruit there will be a light shade of color, but through the holes where the sun has access to the fruit, the letters or figures will be sun-printed. Here is a good chance for some young man to please his sweetheart or his wife, by printing her initials upon some of his finest fruit.

Big pumpkins or fruit often make a great showing at exhibitions. The Alexander apple shown on page 335 would be sure to draw a crowd, although the apple itself, while a fair market variety, has little to commend it for quality. By removing all the fruit and buds except one or two from a vigorous stem, and carefully watching the fruit, it is often possible to

PEACHES AFTER FROST INJURY.

produce these monsters. In a peach orchard a twig may sometimes be found abnormally loaded with peaches, like the bunch of Elbertas shown on page 334. By finding these twigs early in the season, and giving them steady care, it is possible to produce a wonderful cluster, which as an advertisement or a novelty would prove very effective in the market or exhibition.

A WELL-KEPT STRAWBERRY CROP.

We are sending a picture of an acre strawberry bed about to go into Winter quarters (see picture). Last year this acre was manured and planted to sweet corn and at last cultivation Crimson clover was sown, getting a fine stand of clover. In the Fall the clover was manured and this Spring, when the clover was a foot high, it was plowed. After putting same in shape we mixed one ton of fertilizer, consisting of 1,600 pounds of raw bone and 400 pounds of muriate of potash and applied 1,600 pounds of this mixture on the acre. We then planted the bed in rows five feet apart and three feet apart in the row. As the runners came we spaced them nine inches apart each way, which made the beds have five rows each and a two-foot walk between. We want to know if a good heavy covering of wheat straw will produce as good a crop as a covering of manure. Our reason for covering with straw is to do away with weed seed which we are sure to get with bought manure, and the fact of having plenty of straw on hand and we also think there is sufficient nitrogen in the ground. Could you suggest any better fertilizer formula than the one we used?

The variety of berry shown in the picture is Gandy, which is our best market berry. Do you know of a better market variety? The approximate cost of growing to date would be about $200, including plants, interest on land, fertilizer and labor. I would also like to know whether 200 pounds of sulphate of potash applied in Spring would be any benefit to flavor and color of berries, as you advised sulphate mixture against muriate. We have another acre where the plants are a good deal larger, planted the same way. Do you think it would be advantageous to space them one foot apart instead of nine inches, which could be done by planting the rows six feet apart and still have the two-foot walks? Some of our practical neighbors claim this bed is too thick. What is your opinion? Let us know the greatest amount of fertilizer that can be used to the acre to produce the largest crop of berries profitably on good farm land. EUGENE F. GENTHER.

Pennsylvania.

The picture certainly shows a well nigh ideal stand of plants in the Fall. We have rarely seen a better one. Gandy is an excellent market variety on soil which suits it. Usually this is a rather low situation, a soil containing a good deal of organic matter; yet we have known cases where the Gandy did remarkably well on higher soil, without much humus. In Florida, for example, we understand that the Gandy is still a very popular variety, although it does not rank as a heavy yielder. It requires good culture and strong manuring. It is well known in the market both by appearance and flavor, and as it comes late in the strawberry season, it is well liked by most growers, and is probably, all things considered, the best late market variety where the soil is suitable. As for a fertilizer on such soils where manure is not used as a mulch, we should use some dried blood, or other organic nitrogen, along with the bone and potash; 200 pounds of dried blood added to the mixture you mention would help the berries, by giving them a little more nitrogen to be used later in the season. We doubt the wisdom of using much nitrate of soda on the strawberry crop. An organic form like dried blood or cotton-seed meal will usually pay better on this crop. Where stable manure is used heavily for mulching, little if any extra nitrogen is needed, but this amount of dried blood will we believe help out the bone. I should also recommend the use of sulphate of potash in the place of muriate. The sulphate will be likely to give a little better quality and a trifle higher color, and where you are trying to raise the finest berries the sulphate is well worth the extra price. Where one can produce such a field as is shown in your picture, he ought to do everything possible to give those berries the finest possible chance. The use of sulphate in the Spring will not make great difference with the crop, as you now have it. We prefer one foot apart to nine inches. Where the plants are so crowded the berries do not color well and in a damp season there is danger from rot. About one ton of your fertilizer mixture would be the limit of economical fertilizing.

A WELL-KEPT PENNSYLVANIA STRAWBERRY FIELD.

CHERRY CULTURE IN WISCONSIN.

Sour cherries thrive in many parts of Wisconsin, and this State boasts the largest cherry orchard in the world, 700 acres in one solid block. Door County, where this monster pie factory is located, now has over 3,000 acres of cherry trees, and more to be planted this Spring. Bayfield, at the very northern tip, also has several hundred acres. These two northern points are particularly favored on account of proximity to large bodies of water, lakes Michigan and Superior, soils light in texture but fertile, which are underlaid with limestone. Cherries thrive in many of the southern counties and the Lake Michigan shore belt, but are entirely out of the question in north central Wisconsin on account of late Spring frosts.

No cherry trees whatever are propagated by Wisconsin nurserymen, as our climatic conditions are unfavorable to the budding of any kind of fruit trees. Most of the stock planted comes from southern Indiana and Ohio. The well-grown one-year-old tree is the favorite with the big planters. Some two-year stock is used, but nothing over that is ever handled by the nurseries, except to gratify the wish of some city farmer who insists on plenty of wood and brush for his money.

The cherry is no different in its requirements in Wisconsin than elsewhere; it will not thrive except on well-drained land, and is profitable only on light soils. In the big cherry districts of Wisconsin the trees bear surprisingly early. A tree two years planted often bears a quart of cherries, and at four years six to eight quarts. The one-year trees are well branched, and when set are cut back severely, leaving but three or four branches and each branch cept the leader, cut back to two or three buds. The Door County cherry growers have brought pruning to a very high degree of perfection, and on account of this a cherry orchard here at eight to 10 years is a sight to behold. The trees are loaded with fruit literally from "center to circumference." This is done by careful, systematic and heavy pruning every year, and the system practiced is contrary to all the precepts laid down in books. The heavy pruning at planting time is something, we are told, that must be avoided, but it is as essential in training the cherry tree as in the apple. We are also told that heavy pruning of the bearing cherry is bad, but the Door County growers take out more wood from their cherry trees than from their apple trees. Large branches as well as small ones are removed, and no rules are laid down. Each succeeding tree presents a new problem, or rather two problems; to admit light and air to the center of the tree so that fruit buds may thereby be developed clear back to the main axis of the tree, and to reduce the fruit bearing surface to correspond to the strength and vigor of the tree. "Quality first," is slogan of these growers.

Cultivation of these orchards is not different from that practiced in the best apple, peach or cherry orchards elsewhere. Catch crops are grown for the first three or four years, sometimes longer, peas, beans or potatoes, rarely any other crop. Neither strawberries, raspberries nor any other than an annual crop is ever found in these orchards. In the older orchards clean culture is the universal practice, and it is clean culture. The pony gang plow, two or three light plows in one gang, is most popular for the first Spring cultivation. This is followed by either an extension disk or spring-tooth harrow many, many, times during the season. A cover crop is always planted, where no catch crop is grown, and buckwheat is now the popular crop. This is planted so as to yield a crop of grain and cut to leave the bulk of the straw on the ground. The larger growers are now using buckwheat as a combined crop, giving clean culture until August.

The spray pumps are rarely idle, first a dormant lime-sulphur spray followed by Bordeaux three or four times before the picking season, and at least once after. Slugs, shot-hole fungus and all the other cherry ills are present, but none is feared. It is just simply spraying and cultivate, cultivate and spray without ceasing. That all this is essential to any kind of success is proven by occasional orchards whose owners have depended on Door County soil, climate and Divine Providence to produce a crop.

FREDERIC CRANEFIELD.

THERE are always three great honest words to fall back upon—"I don't know." Some wise men seem to think there are pins in this seat.

BREEDING IMMUNE CHESTNUTS.

For centuries the native chestnut has flourished in many parts of the North American continent, and as far as known suffered no attack of serious disease until the closing of the last century, when the terribly destructive bark disease (Endothis parasitica) made its appearance on Long Island, N. Y. The seriousness of the disease was first recognized by Merkel in 1904; since then it has spread over many hundred square miles of territory, destroying practically every native and European chestnut tree with the infected areas. The financial loss cannot be accurately estimated but is very extensive.

HYBRID CHESTNUTS.

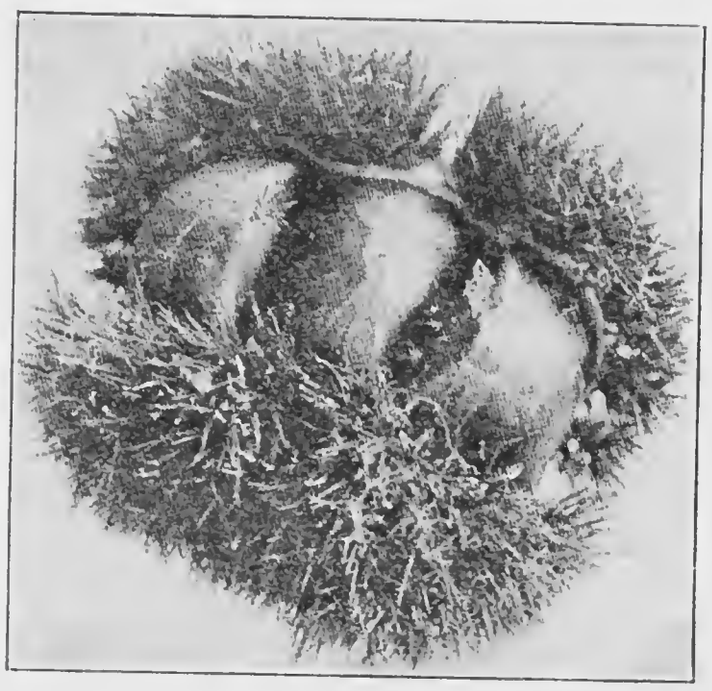
NUTS OF VIRGINIA CHINQUAPIN.

Much labor and large sums of money have been expended in an effort to bring the disease under control, but thus far without success, and on account of the virulent nature of the disease and its tenacity of life, being able not only to live, but to thrive and multiply its ascospores for a long time after its victim succumbs, and the various and comparatively easy means by which the ascospores may be transported into adjoining new territory, makes it extremely doubtful if this valuable native tree can be saved from complete destruction. The outlook at the present time is not at all encouraging.

Nearly everyone who has an intimate knowledge of the disease, believes that if the chestnut is saved to the nation at all, it must be done through the procuring of species or varieties immune from the disease. With this in view, the Division of Forestry, U. S. Department of Agriculture, has in the last few years done considerable experimental and research work along that line, with very encouraging results. The Dr. Van Fleet hybrids, a number of which have been on trial for the last four years at the Government Farm, Arlington, Va., are very promising and give much encouragement of being highly successful. In an article entitled "Chestnut Breeding Experience" by Dr. Van Fleet, published in the Journal of Heredity for January, the history and progress of his chestnut breeding work and the attendant results are interestingly told, and from which we take (by permission) the following extracts:

The breeding work was commenced in 1894, 10 years before the discovery of the destructive bark disease, and continued through the succeeding years up to 1907. All the species of the germs available, including the Virginia chinquapin, were used in the work. The latter year the disease appeared and summarily terminated the experiments with Castanea Americana and its derivations, but selective work has since been continued with self and chance-pollinated individuals of chinquapin and Asiatic types.

HYBRIDS PRECOCIOUS.—From the controlled pollinations over 200 seedlings were grown. Practically all showed unmistakable evidence of hybridity; nearly all have fruited. The combinations of Asiatic and European chestnuts with our native species rarely set burs until five to 12 years of age, while the chinquapin-Asiatic crosses frequently bloom and occasionally ripen nuts the second year



HYBRID CHINQUAPIN.

after germination ,and in some instances produced several pounds of nuts the third year after planting the seeds. The bark disease has been allowed to work its will among the hybrids, with the results that trees having C. Americana, also the European in any combination, have all succumbed to the ravages of the disease. The crosses of Asiatic and native showed greater resistance, but all have been seriously affected. The chinquapin-European hybrids are readily affected, but have greater recuperative powers. The Asiatic chestnuts and the chinquapin-Asiatic hybrids are plainly highly resistant. Few have shown any appearance of the infection and when noticeable the injury is quite local in character. Second generation seedlings of chinquapin-Asiatic crosses show no disease at all, though always exposed to infection.

QUALITIES OF HYBRIDS.—The material results of this breeding work, other than the disease resisting features, are shown in the various illustrations accompanying this article. Hybrid chinquapin having varieties of Castanea crenata (Asiatic) for pollen parent form vigorous, small, much branched trees, rarely shrubs, and come into bearing at three to five years from the seed. The burs are borne like chinquapins in clusters of three to five, rarely solitary, and contain from one to three chestnut-like nuts four to six times larger than chinquapins. The nuts begin to ripen late in August, the crop being wholly mature by October, thus preceding all other chestnuts of marketable size.

CHINQUAPIN-ASIATIC CHESTNUT HYBRID.

TREES ARE VALUABLE.—The trees are vigorous growers, decorative from their compact form at all times, but especially when in fruit and flower. They should prove highly desirable for lawn planting as well as for nut growing. The size they will attain is problematical. Their precocity and profusion in fruiting would indicate that they are not likely to attain large dimensions, and that it would be safe to plant them for orchard purposes 12 to 15 feet apart. In conclusion Dr. Van Fleet writes: "Chestnut breeding, though greatly hampered by the advent of the new disease, thus makes its appeal as a highly promising occupation. It appears probable that the chestnut in its most desirable form can be saved to horticulture as a nut producer, if not to forestry as a profitable timber tree, and there is even a chance that the latter highly important feature may in the end be spared."

K.

BUNCH OF ELBERTA PEACHES.

MONSTROSITIES IN PLANT LIFE.

Monstrosities of whatever kind are always objects of more or less interest to most people, especially if the object is a product of nature. This is particularly noticeable at the agricultural fairs or other shows where the products of the soil are on exhibition. It is there where the very largest and perfect specimens are expected to be seen. It matters not how fine the rest of the exhibit may be, the monstrous or phenomenally large things are, as a rule, the objects of greatest interest. The largest pumpkin, melons, eggplant, apples, potatoes, cabbage, ears of corn, plants and flowers, are the centers of attraction, and invariably take the attention away from the more common things that really make the big things, monstrous by reason of the contrast. That it requires knowledge and skill to grow these big things, goes without saying. Nothing is left to chance, but from the beginning and up until the end, the thoughtful, painstaking and intelligent care of the producer has been given them. Cut opposite shows a tomato plant that has attained to monstrous size. This plant was grown under glass and received intelligent care in the way of feeding, training, etc., from infancy to old age. The plant is evidently nearing the end of its usefulness, as apparently but a few fruits remain to be gathered. Many of THE R. N.-Y. readers will no doubt be interested in how some of these big things are grown and while we do not know the life history of this particular plant, which has been grown in a box about 16 inches square by 12 inches deep,

the same general method of culture and training is applied to the production of all such monstrosities.

SOIL.—The soil should be a rich compost made from sods cut from an old pasture field, the soil of which should be a rather heavy sandy loam, mixed with an equal bulk of well-rotted cattle manure. This compost should be made up at least six months before wanted for use, and should be cut down with the spade and turned over two or three times during that period, in order that it may become thoroughly mixed and finely pulverized.

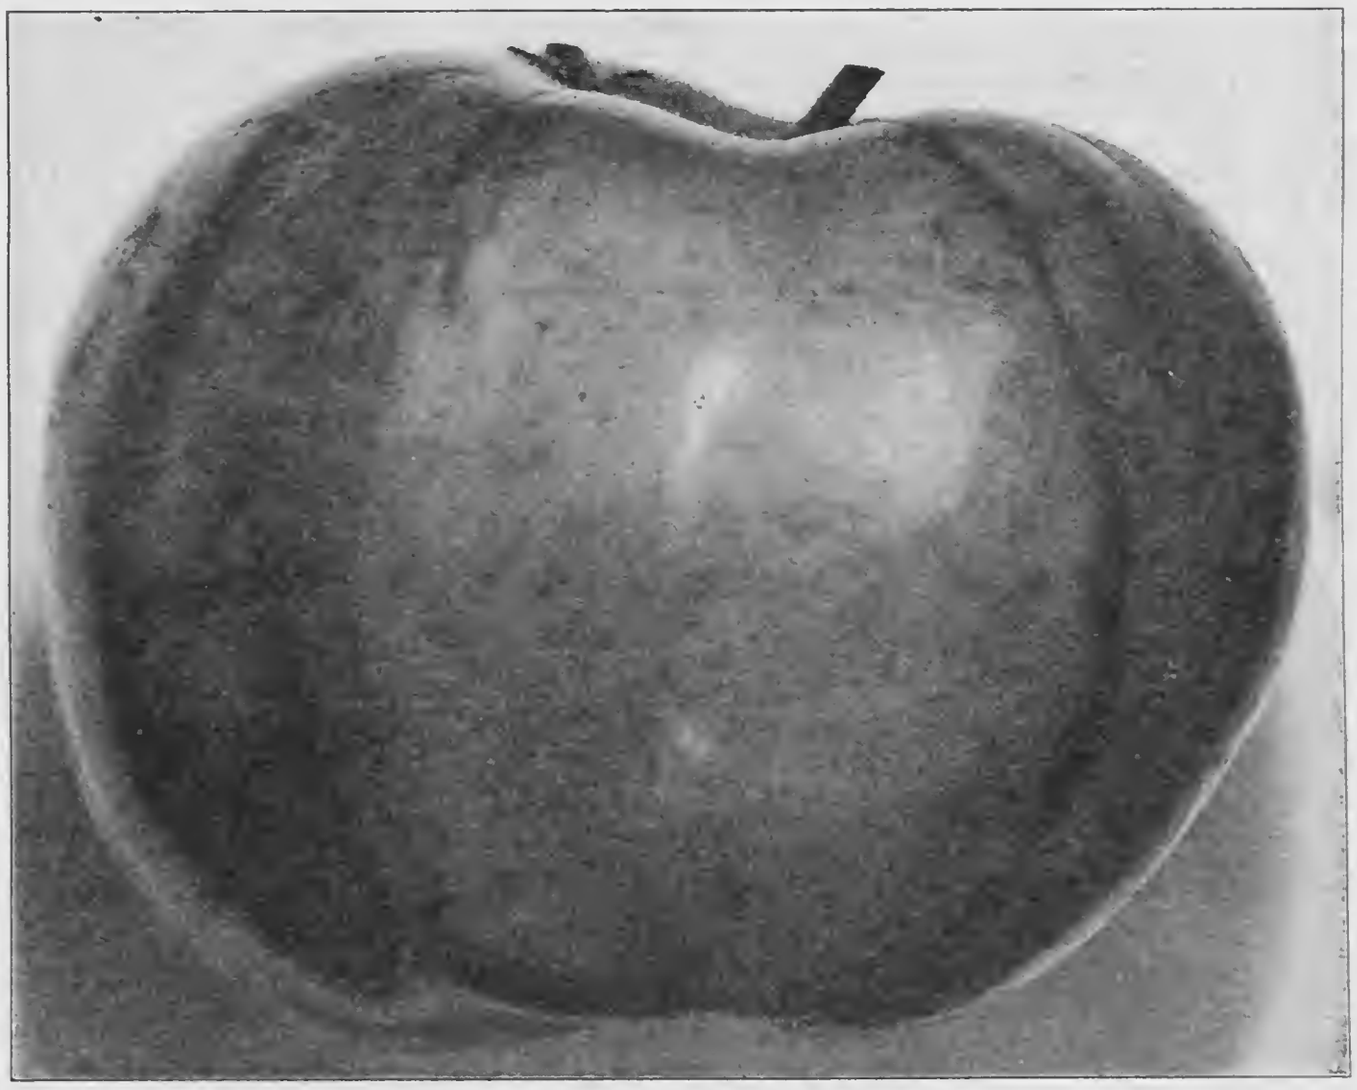
SOWING.—In the latitude of Philadelphia and northward, the seed should be sown August 10 to 15. As soon as the seedlings develop their first set of twin leaves, they should be transplanted deeply in 2½ or three-inch pots, and are kept growing rapidly as possible without producing a tender succulent growth. As soon as the small pots are filled with roots the plants are shifted into pots one inch larger, and when the plants have reached a height of 14 to 16 inches, or when they have developed their first blooms, they are shifted into their permanent quarters, which may be the benches, large pots or boxes, but for the production of large plants the boxes are to be preferred rather than pots, as they are much more economical in cost and are safer to handle. The boxes should be 16 or 18 inches square by 12 inches deep. Three one-inch augur holes should be bored in the bottom to provide for drainage, and an inch or so of coarse coal ashes or broken pots be put in the bottom of the box, to facilitate the carrying off of the surplus water. Soil to a depth of one inch will be sufficient covering over the drainage material. Set the plants in the center of the box and fill in with soil to a height of one inch above the ball of earth surrounding the roots of the plant, leaving the remainder of the space to be gradually filled in as the plant increases in size and demands more food. As the tomato requires bottom heat for proper development, the boxes should be placed on a bench that is not over 12 or 14 inches above the heating pipes.

TRAINING.—It is a common practice in bench culture to train the plants to a single stem, but when handled in boxes, two or three stems may be utilized to good advantage. In either method of training all side shoots must be pinched off soon as they appear, so that all the strength of the plant may go to the development of the main stems and fruits. As the plants will become top-heavy and fall over they will require support of some kind. In box culture a bamboo cane may be used for each stem, to which they are tied with ratlia or other soft material. The temperature should be kept at 60 to 70 degrees at night, and about 10 degrees higher during greater portion of the day.

WATERING.—Care must be exercised not to keep the soil too wet nor to allow it to become dried out, or the plants cannot be kept in a healthy condition. After the boxes have been filled with soil and become pretty well filled with roots the plants may require additional food to keep them moving. This is best supplied in the form of liquid cattle manure, to each bushel of which may be added a shovelful of fresh hen manure. It is placed in a coarse gunny-sack and suspended in a barrel of water. Apply once or twice a week, or as often as the plants may seem to require it in place of clear water.

As the life of the plant under glass is from six to 10 months, by intelligent care and proper feeding, many plants of the robust tall-growing varieties of tomatoes used for forcing, may be grown to gigantic size, but at no time should undue forcing of plant growth be made at the sacrifice of the fruits. The compost may be used with equally satisfactory results, for crops in the open, as pumpkins, melons, cucumbers, cabbage, eggplant, etc. A judicious quantity of fine ground bone or hen manure may be added to the compost with benefit. For pumpkin or squash use a good wheelbarrow load in each hill, and for the less rampant growing things use proportionately less. If monstrosities are desired, allow but one or two fruits to each plant, removing all the others as soon as noticed. In dry weather soak well once or twice a week with liquid cattle manure; chemicals in liquid form applied judiciously will also prove helpful. In the production of these big things, the whole secret lies in the intelligent culture given them, and that is really no secret at all. Just good common sense properly applied. K.

MONSTROUS TOMATO PLANT.



WESTERN NEW YORK ALEXANDER APPLE. ACTUAL SIZE.

SPRAY MIXTURES FOR ORCHARD AND GARDEN.

Spraying Against San Jose Scale.

The writer still believes in using lime-sulphur on all young and smooth-barked trees and always on peach trees. For this work a good commercial brand or similar homemade mixture diluted at the rate of one part to nine parts of water, is the best spray that we can recommend at the present time. On old apple trees badly infested, an oil mixture may be used. That the latter has greater penetrating power is unquestioned. It is often difficult to eradicate the scale entirely or even to hold it down to unnoticeable numbers without using oil, which should be diluted at the rate of one part to 15 parts of water.

Three years ago the station purchased a small farm at Mt. Carmel, Conn., upon which were 50 medium-sized apple trees, which though still sound, had been starved and otherwise neglected, and a few were badly infested with San José scale. We have never used oil on these trees, and have attempted to control the scale entirely by spraying with lime-sulphur. After two treatments very little infestation could be found on the twigs, but enough scale survived each treatment so that their progeny considerably disfigured the fruit, and also crawled upon the new growth. In order to prevent this, two sprayings were given last year, once in December and again about April 1st. The subsequent crop of fruit, rarely showed any scale marks. The young scales will not readily set upon bark which has been previously coated with lime-sulphur.

There are now several lime-sulphur powders on the market. Some of these, if not all, contain large proportions of sodium sulphide, this being an inexpensive product. They are not, therefore, lime-sulphur but soda-sulphur powders. These powders will probably be efficient and satisfactory as dormant sprays to destroy the San José scale. For Summer treatment of the foliage and fruit, however, there is danger, especially where arsenate of lead is used. The presence of sodium causes a chemical reaction in which sulphide of lead and arsenate of soda are formed: the latter is readily soluble and is extremely destructive to plant tissues, being used to destroy poison ivy. Manufacturers claim that because the mixture as used in Summer is so dilute, that the injury is negligible.

Ten years ago in our efforts to obtain a lime-sulphur mixture without boiling, we employed at this station the fused sodium sulphide, purchasing it in 110-pound drums for the purpose. This material is hard as a rock, contains 60 per cent of sulphur, and when broken shows a reddish color and resembles the mineral cinnabar. On exposure to the air it blackens and gives off an odor of sulphureted hydrogen. By breaking it into small pieces—no larger than a hen's egg—it readily dissolves in water. We thus added it to the slaking lime, the heat of which helped it dissolve. The caustic solution of sodium sulphide thus formed proved to be an excellent solvent for the sulphur. Several formulas were used, but one containing 14 pounds lime, 11 pounds sulphur, 11 pounds sodium sulphide per barrel of water, gave the best results, and compared favorably with the boiled lime-sulphur mixture as a scale destroyer. It was, however, more caustic to handle. An account of these experiments may be found in the Report of the Connecticut Agricultural Experiment Station for 1904, page 221, and so far as the writer is aware, this was the first attempt to use sodium sulphide to destroy the San José scale. The manufacturers of these soluble sulphur powders claim that the sodium has been through a new and original process, which subjects it to great heat, which destroys all its burning qualities. Be this as it may, the real danger lies, not on account of the direct caustic action of the sodium sulphide when used in so great a dilution, but on account of the chemical action with the arsenate of lead, causing local injury which may not be at all uniform in effect.

SPRAYS TO KILL APHIDS.—During the past year we have tested the merits of the nicotine preparation "Black Leaf 40," which contains 40 per cent of nicotine sulphate. This is said to be more uniform than most of the other tobacco preparations on the market, and as it is highly concentrated, will bear a heavy dilution. For most kinds of aphids, one teaspoonful to a gallon of water makes an effective spray, killing all aphids which it hits. It can be used at double strength safely. In some instances, as in spraying peas or cabbages the liquid does not moisten the leaves, but rolls off in drops as from an oiled surface, or like water from a duck's back. By the addition of soap (say one pint of soft soap to the barrel) the spreading power of the spray and consequently its effectiveness is greatly increased. "Black Leaf 40" can be mixed

(*Concluded on page 336.*)

with the lime-sulphur and lead arsenate spray and thus makes it more effective in destroying aphids. It is not safe, however, to add the soaps to such a mixture. But "Black Leaf 40" has its limitations. Apparently it is of little use in killing the cottony maple scale, which is rather abundant in some localities on soft maples. For this purpose the oils are promising.

ARSENICAL SPRAYS.—Lead arsenate is still the standard poison for orchard spraying. Three pounds of the paste, or half as much of the powder, should be used for a barrel of the mixture. In our experience at the Connecticut Station, dry powdered lead arsenate has given just about as good results as the paste. Both have been used alone and in combination with lime-sulphur and with Bordeaux mixture. This agrees with the experience of Dr. W. E. Hinds of the Alabama Station, who has used large quantities of the poison, especially against cotton insects. For destroying the adults of the apple and cherry maggots, Mr. Illingworth, formerly of the Cornell Station, found that a sweetened arsenical mixture consisting of 2½ pounds lead arsenate, 1½ gallon of cheap syrup to 50 gallons of water, sprayed upon the lower branches by hand, June 10th and again June 24th, was effective. The flies were attracted by the syrup, ate the mixture and were killed by the poison.

For treating the foliage and the fruit of the apple orchard, nothing is more effective than freshly-made Bordeaux mixture and lead arsenate. Unfortunately

SPRAYING 12-YEAR TREES, HEADED LOW.

certain varieties are russeted by the Bordeaux, and this is the chief reason for using a dilute lime-sulphur instead. We may overcome this tendency in part, by using in the second and third treatments a weak Bordeaux, i. e., one pound of copper sulphate instead of four pounds, to four pounds of lime. In tests at the Virginia Station, a combination of two pounds of copper sulphate to a barrel of diluted lime-sulphur gave an effective spray which caused no injury.

None of the prepared Bordeaux powders seems to be as effective as the freshly-made Bordeaux mixture.

Commercial lime-sulphur diluted at the rate of one gallon to 40 gallons of water, is now used largely as a fungicide on apple foliage and fruit, especially on those varieties which are russeted by Bordeaux. To this lime-sulphur, the lead arsenate should be added to kill the chewing insects. W. E. BRITTON.

Conn. State Entomologist.

Injured Cherry Trees.

In the Spring, I planted an Early Richmond cherry tree. It seemed to thrive all right during the season. In 1912 I ran a wheelbarrow against the base of the tree, thereby loosening a patch of bark an inch long, I should judge. This seemed to heal over, and last year the bark seemed to burst open along the whole length of the trunk, and a new growth of bark came in this long slit. Now the new growth is well formed and still it comes in contact with the old bark. This tree was reset in the Spring of 1912, and part of the top died after resetting which was carefully trimmed away; the tree did not make much growth last year, although it seems to have caught up with its lost vitality. I have another cherry tree set in Spring of 1912 which is doing well, but in the Fall of 1912 I accidentally ran a wheel against the base of the trunk, thereby peeling the outside bark a little, and this seemed to heal with a peculiar hump with a hole in the center, although otherwise all right. What causes this? Is the bark of cherry trees so tender that one must be very careful with the handling of them?

Colfax, Iowa. W. A. H.

Probably the bursting of this tree was caused by the extreme cold weather. If these cuts started from the old wound, that may have caused part of the trouble. We seldom find this splitting in the sour varieties. Other kinds are sometimes split from the ground to the lower limbs. In most cases the tree recovers when the injury is not too deep. Resetting your tree probably caused part of the top to die. Perhaps you did not trim it enough when replanting. If it has recovered its vitality you could let it go; otherwise, we would plant a new tree. In the second case the wound should not be serious unless it refuses to heal. In that case, there is probably a spot of dead wood underneath. If not too large, and the tree remains healthy, the bark will grow in from the outer edges and cover the whole. This tree is likely to live and bear for many years. It will probably not be a perfect tree, but may give a fair yield of fruit. These questions emphasize the necessity of care against bark injury. Wounds from a tool, unless cared for promptly, will often seriously injure the growth of the tree. Many of our best fruit growers no longer try to work the cultivators up close to the tree, but prefer to leave a strip about two feet wide to be worked down low by hand tools.

Mixing Spray Materials.

We have seen people who have a mania for experimenting with a sure thing. Some of them mix soft soap or lye with soluble oil or lime sulphur, put lime with oil, or try all sorts of combinations with standard materials. The result is usually a mixture which does not combine, and which causes considerable injury to the foliage or buds. The Colorado Experiment Station puts the case well as follows:

Many persons are likely to believe that because certain sprays are good separately they are even better when combined. In our work we find quite a large number of men doing a great deal of mixing of their own. Investigations at various experiment stations has shown that this is often foolish and wasteful, that the mixtures they make may be absolutely worthless and that certain elements which are good when used separately may be made worthless when combined.

The experiment stations and agricultural colleges have done a great deal of work on the different methods and materials for the control of our common insect pests and diseases, and they are constantly writing bulletins recommending certain sprays that have been found best for each pest or disease and only in rare cases do they recommend a mixture of materials. These cases are where two insect pests or diseases are present that demand different treatment, as for instance, tobacco and arsenate of lead may often be used together to good advantage for two such insects as codling-moth and plant lice, the arsenate of lead to destroy the chewing insect, the codling-moth, and tobacco as a contact spray for the sucking plant lice. In this case, neither the tobacco nor the lead is injured or benefited by the presence of the other, and each must be used at full strength.

Whole crops have been known to be lost by the grower deciding that a little lye would be a benefit to his spray.

Before deciding not to follow the recommendations that has been worked out by years of investigation, it would be well to ask advice from some one of experience what results might come from some of your own mixtures.

"You are a relation of the Richleighs, aren't you?" "Yes, a distant relation." "How distant?" "Well, as distant as they can keep me."—Boston Transcript.

Cover Crops in Orchard.

We have a few acres of rye in a young apple orchard, that we would like to sow in Red clover this Spring. If we cut the rye, before it seeds, will it be best after cut to rake it off, or will it smother the clover if we leave it on the ground?

We have another apple orchard where we would like to sow Canada field peas and oats. Will the peas and oats injure orchard if left and cut for hay? Can I sow Red clover when I sow the peas? B. H. B.

Hightstown, N. J.

It is never good practice to grow rye or other grain crops in a young orchard. Unless the season is very wet this practice is sure to dry out the soil and hurt the trees. In the case you mention we should cut the rye early, rake it and pile it around the trees. This would probably overcome the effect of growing the rye, and would give the clover a fair chance. We have never succeeded in obtaining a good catch of clover when seeded with oats and peas. This crop grows thick and rank, and is apt to smother out a seeding. We assume this second orchard is older than the first one. Otherwise we would not advise you to sow the oats and peas, or any other grain crop in it. Barley makes a better seeding or "nurse" crop.

Fertilizer for Fruit Trees.

What fertilizer will take the place of unleached hard wood ashes for fruit trees? Apples and pears more particularly. W. J. B.

Unleached ashes of good quality contain in one ton about 100 pounds of potash, 35 of phosphoric acid, and over 600 pounds of lime. This amount of plant food will be obtained in 200 pounds of either sulphate or muriate of potash, in 250 pounds of basic slag and 1000 pounds of air-slaked lime. This combination will give you the actual plant food contained in the ton of ashes, yet this mixture might not give as good results in the orchard as the unleached ashes would. Our experience goes to show that the natural ash of good quality gives better results than any mixture of chemicals, offering an equal analysis. There are, however, some adulterated samples of ashes on the market, but the pure ash will give good results.

Broadcast Phosphate and Potash.

Will it be advisable to go to the expense of broadcasting 100 pounds of muriate of potash and 500 pounds of Thomas slag to the acre, or would it be better to withhold the fertilizer for the crop, probably clover, to be sown when the rye is turned under the following Spring?

New York. J. M. C.

We would by all means use the fertilizer on the cow peas or clover, especially in case this crop is to be plowed under for corn or some similar crop. The cow peas, clover and similar crops are useful for taking nitrogen from the air, and on general principles the more we feed them, the larger they will grow, and the more they will thus add as green manure or fodder. Many wise farmers follow the practice of applying their phosphate and potash to the cover or sod crop. They get a larger growth in this way, and the chemicals are not lost, but are made use of by the cover crop, and thus carried on to the crop which follows them. At the same time there is usually more nitrogen gathered by the cover crop. The combination of slag and muriate of potash is not the best one. Sulphate of potash would be better for this combination. The action of the salt in the muriate would be to form a combination with lime, which is easily washed out of the soil, while most of our efforts now in the East at least are with a view to retaining lime and not wasting it.

The Strawberry Weevil.

What is a good remedy for weevil in strawberries? We are living in South Jersey now, and our friends say strawberries do not fruit well on account of weevil. M. E. S.

Ormond, N. J.

There is evidence to show that plants sprayed with Bordeaux mixture and Paris green are decidedly less troubled than those not sprayed. Of course, this may be due to the Bordeaux mixture, which is objectionable to many insects and serves to protect treated plants, even when it does not kill the insects. When the strawberry weevils are very abundant it is surely worth a trial. The Bordeaux should be made of four pounds of copper sulphate and four pounds of lime to 50 gallons of water, and one-half pound of Paris green or two pounds of arsenate of lead should be added to each 50 gallons of the mixture. The application should be made just before blossoming begins and should be very thorough. Spraying while in bloom is objectionable, because of the danger of preventing pollination by bees and other insects.

It has been demonstrated that the plants can be kept free by covering the rows with muslin or other light fabric, put in place a week before the first buds are ready to open, and that the covering promotes early ripening and better fruit. The cloth must be a little wider than the rows, and must be kept above the plants by fastening to lines of pegs set near enough together to hold the covering taut. The covering need remain only until the first berries begin to color, because by that time the plants would be no longer attractive to the beetles. This method is practicable only on small patches. The most promising measure of all is, however, to be found in the selection of varieties. Pistillate varieties are not subject to attack by the beetle, and it should be possible to secure a good pistillate variety to form the main bulk of the crop. This will need, as a pollenizer, a profusely flowering staminate variety, which may form every fifth row in the field, and the crop from which may be sacrificed to the beetles if they furnish flowers enough to pollenize the others. This staminate variety should be a little earlier in blooming than the pistillate variety, so that there may be an abundance of pollen as soon as the pistillate varieties open. T. S. HEADLEE.

A Fruit-growing Township.

Clover Leaf Grange recently, through a committee, made a fruit census of North East township, Pa., with the following statement: We have no doubt these acres will average $200 each in value of output.

We the undersigned committee, appointed by Clover Leaf Grange, No. 1265, P. of H. to ascertain the acreage of fruit grown in North East township beg to submit the following report, which we believe to be comparatively accurate:

	Acres.
Grapes	6,986
Apples	437½
Peaches	444
Plums	122
Prunes	212¼
Cherries	326¼
Pears	36½
Strawberries	28
Red raspberries	84¼
Black raspberries	34
Currants	57
Gooseberries	19
Blackberries	6¼
Total	8,793

Long Island Apple Culture.

On page 46 you say for years the experts taught that Long Island is out of the apple belt. I am sending you by parcel post, two Greenings and two Baldwins from two of my 50-year-old trees, standing in sod, on high rolling land about eight miles from salt water on the north and south. The orchard includes such varieties as Porter, Fall Pippin, Yellow Bellflower, Northern Spy, Seek-No-Further, Greening and Baldwin. Some of the trees are very large, spreading 40 to 48 feet, and a 20-foot ladder does not reach near the top of a few. Fifteen years ago, when apples were low in price, these trees were badly neglected. Then about the time THE R. N.-Y. started Apple Consumer's League, and prices improved, I began scattering wood ashes around some of them, spreading stable manure over the ashes and coarse litter over all to prevent washing. This caused the trees to bear freely, but in a few years the apples rotted badly after picking. Believing that the manure caused this I discontinued its use, and my present practice is this: As early in Summer as my other work will permit I sow around each of my best trees a half bushel of sifted hard wood ashes, 25 pounds of a 3.29-8-7 fertilizer, and the past season I added a waterpail full of agricultural lime to a few trees; then cover with whatever coarse litter I have. These trees have never been sprayed and only partly pruned, and I have considerable defective and decayed fruit, but so far as production is concerned I think Long Island is "in" the "apple belt." On October 6 I picked 12 bushels of Greenings from the tree from which I send you two, and one bushel from the ground, as there had been a high wind.

Suffolk Co., N. Y. W. V. H.

R. N.-Y.—The apples came in good condition and were well colored and flavored and of good size. When Long Island produces such fruit there is no question about the "apple belt."

The principle—Two layers of glass with a ⅝-inch layer of dry still air

Perfect Your Garden With

Sunlight Double-Glass Sash

While you are thinking about growing early plants so as to have early vegetables to eat or to sell, write today for the catalogue or booklet telling all about the

Sunlight Double-Glass Sash

The time to get ready is now.

These sashes are in use by hundreds in every State in the Union and are paying for themselves every season in extra profits. They are a model of efficiency. The extra layer of glass with the air space between conserves the warmth in the bed and does away with the need to buy or use mats or shutters. Here is a saving of 50% in labor and worry. The plants are earlier and stronger; here is a gain in money returns.

A new double-glass greenhouse

The Sunlight idea has been carried into an inexpensive greenhouse, 11x12, 11x24, 11x36 or 11x48 ft. in size. It is made of Sunlight Double Glass Sash, which are instantly removable when the greenhouse is idle for use on hot-beds or cold-frames. Thus they serve a double purpose. Sash ordered now for Spring work may be used on a greenhouse frame ordered at your convenience for next Fall or Winter.

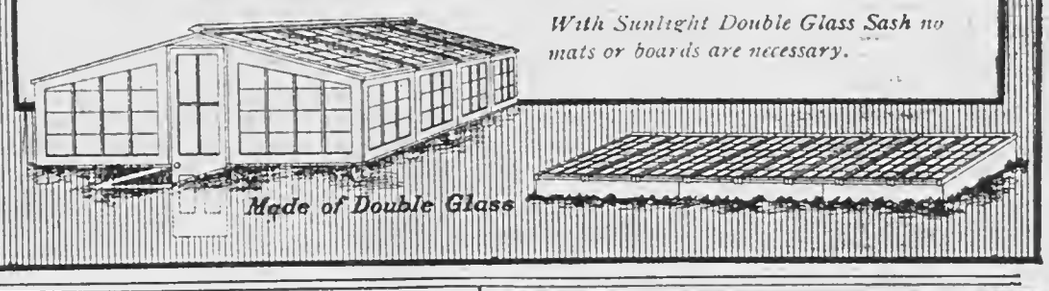
Write for these two books today

One is a book by Prof. Massey, an authority on hot-bed and cold-frame gardening, and the other is our FREE catalog. If you want Prof. Massey's book, enclose 4 cents in stamps.

Sunlight Double-Glass Sash Company

924 East Broadway — Louisville, Kentucky

With Sunlight Double Glass Sash no mats or boards are necessary.



GREAT CROPS OF

STRAWBERRIES

AND HOW TO GROW THEM

IS the title of a beautifully illustrated book of expert information written in every-day language by America's most successful strawberry grower. It explains how the Kellogg Pedigree plants are grown on the great Kellogg plant farms in Oregon, Idaho and Michigan. It contains pictures of the best varieties of strawberries, including fall-bearing kinds, and gives full descriptions. It tells how to grow big crops of fancy berries, and how to market them at big prices. Explains in detail The Kellogg Way.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden only or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry Garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries, the year 'round for less than one cent per gallon. Our Book gives full information.

Strawberries yield more dollars per acre and give quicker returns than any other crop. Set one acre to Kellogg's Pedigree plants this year, and put from $500 to $800 in the bank next year. Our Book tells you how. IT IS FREE.

R. M. Kellogg Co., Box 480, THREE RIVERS, MICH.

There's Money In Strawberries

Yes, sir, there's big money in them if you start with the right kind of plants—the sure grow kind.

Baldwin Plants

are all large and healthy. They are northern grown, have heavy roots and are fully guaranteed.

GREGORY'S HONEST SEEDS
All that's Good in Seeds — For Farm Garden&Home
For over half a century we have supplied Honest Seeds. They have made good for planters everywhere, whenever properly handled. The name Gregory stands for crop insurance.
A Trial Will Prove
the high quality of Honest Seeds. They are just as good as human efforts can make them. No matter what you need—garden, field or flower seeds—we have them, all of choicest pedigree, many grown by ourselves.
Instructive Catalog FREE
Tells home gardeners when and how to plant seeds. It helps to better gardens. A postcard will bring it. Write To-Day.
J. J. H. GREGORY & SON,
536 Elm St., Marblehead, Mass.
ESTABLISHED :: 1856 ::

Do You Have to be Shown?
I'm told that I have the best quality of seed, give the largest packages and have the most common-sense Seed Book in the bunch. And I'm willing to admit it.
Do you have to be shown?
All right. I live close to the Missouri line and I'll "show" you.
I'll send you the *Seed Book* and a *big package of garden seed*, and you can judge for yourself. NO CHARGE FOR EITHER, and you need not even send the postage unless you wish.
I also have guaranteed Clover and Alfalfa, and all kinds of farm seed at Farmer's Prices. Shall I send you free samples of these also?
HENRY FIELD, Pres.
HENRY FIELD SEED CO., Box 26, Shenandoah, Iowa.

SEED CORN
Highest yielding varieties. We welcome comparative tests between ours and others. *Wing's Improved Whitecap* has never been beaten in our fields. *Wing's 120-day Yellow* is earlier and was good enough to win the State Corn Contest in one-acre plots in 1912. Yield 139 bushels, 17 lbs. *Our Clarage* is maturing for us in about 100 days and yielding practically the same as later varieties. We have some very choice 1912 stock carried over and very moderate stocks of 1913 seed. All our corn is now being cured on the patent wire hangers which insure practically perfect germination. For many years all of our corn has been bred from ear-row test plots. Write for catalog and prices.
WING SEED CO., BOX 423 MECHANICSBURG, O.

BLUE MOUNTAIN ENSILAGE CORN
Grows mammoth stalks with big ears and full of leaves. Its early maturity always insures a full crop of ideal forage before frost. A very vigorous sort, often growing 14 to 16 feet tall. Our extra selected seed gives highest satisfaction.
GREAT DANE OATS
A heavy yielder of highest quality. Berries golden yellow, with thin hulls and heavy meat.
Write for FREE Circular
Let us tell you more about O. & M. pedigreed farm seeds. Shows through pictures what results others score with them. Send a postcard request Today.
OATMAN & MONFORT, Box 114, CLEVELAND, OHIO

FORD'S OLD VIRGINIA ENSILAGE CORN
Solves the feeding problem—one of our customers filled a 70-ton silo from 2½ acres. Stalks grow 12 to 15 feet, often weigh 6 lbs. or over, and produce two ears each. Matures well, and is the greatest milk-producer of all corns.
Our farm seeds are carefully selected and tested. Send now for our free Catalogue of Farm and Garden Seeds.

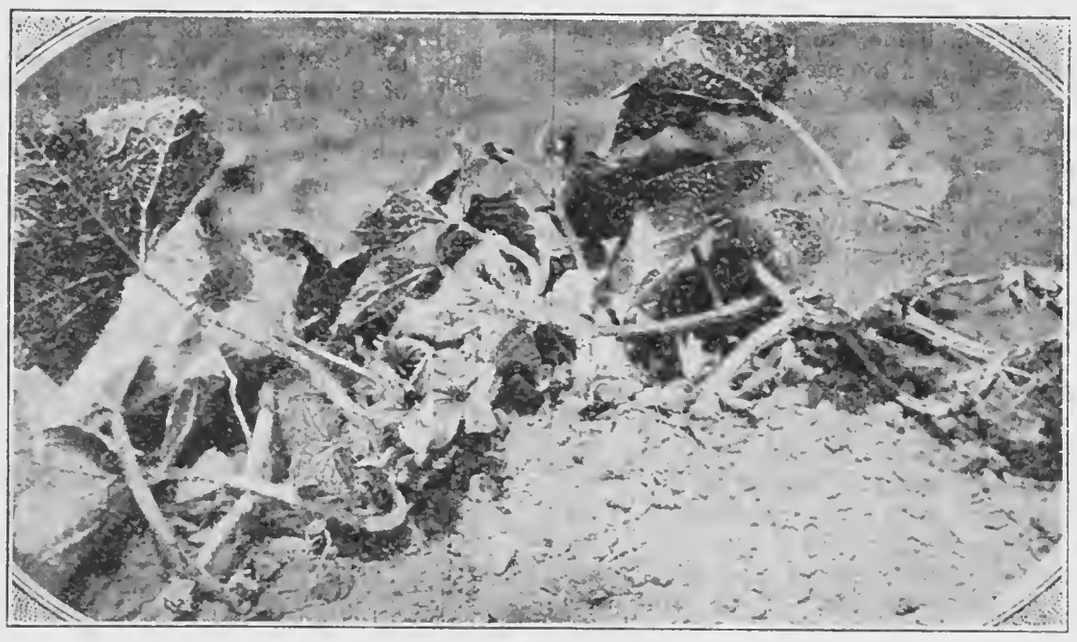
DREER'S 1914 Garden Book
THE amateur will find just the information needed to make his garden a success—over one hundred clear, concise, dependable cultural instructions for growing almost every flower and vegetable worth bothering with.
The list of worthy novelties and old favorites is complete and dependable. Especially important are the sections devoted to Roses and Dahlias. The collection of Hardy Perennials is the largest in America. Selected strains of standard vegetables and flowers.
Mailed free to anyone mentioning this magazine.

Dreer's Superb Asters.—The finest strain, either for garden decoration or cutting. Packets contain enough seed to produce more than one hundred plants. Made up of eight beautiful colors. Ten cents per pkt. DREER'S GARDEN BOOK with each order.
HENRY A. DREER
714 Chestnut St. Phila.

SWEETENED POISONS KILL RAILROAD WORMS.

The apple maggot, or railroad worm, is a serious pest in the northeastern United States and Canada. The principally infested districts extend from New Brunswick, Quebec and Ontario south to Pennsylvania and west to Iowa and Wisconsin, and occasionally in other States. It is an American insect, and originally lived on the hawthorne and wild crab, but has found our cultivated fruits far more palatable, so that now it is seldom, if ever, found on the wild fruit. So generally is this insect distributed that in New Hampshire 95 per cent. of the orchards are infested, and in other States there have been reports of from 50 to 100 per cent. of the orchards being infested.

The apple maggot is the larva or worm of a small fly about three-eighths of an inch long, with its wings mottled or striped with black. The larva eats its way through the flesh, filling it full of small needle-like tunnels, which cause the apple to rot prematurely. In the Summer, in apples yellow in color, like the Sweet Bough, the flesh about the point where the egg was deposited becomes a dark brown in a few days, and when the apple gets near maturity each



CUCUMBER SPRAYED FOR BLIGHT WITH BORDEAUX.

of the tunnels is easily followed by the dark brown flesh encircling it.

The flies appear in New York State according to Mr. James F. Illingworth, who has made a very complete study of this pest, from about the middle of June onward. The insects seem to adapt themselves to the variety on which they are growing, appearing early or late according to whether they are infesting Summer or Winter apples. The first to appear, those infesting the early Summer apples, usually are responsible for a second brood. Not all the pupæ from these first larvæ come out the same Summer, however. But at least about 30 per cent. do, so there is a continual infestation from the early Summer onward in the neglected orchards.

In the past the standard method of holding the apple maggot in check has been to pick up the fruit and destroy it, but nobody has ever been nearly successful with this method for some reason, probably because it has never been thorough enough. Even having stock in the orchard—which I do not advise—to eat the fallen fruit has not proved successful, as the animals seem to get a surfeit of fruit, leaving some on the ground. If you do not believe in spraying, to be successful the Summer apples like the Sweet Bough, or Red Astrachan, should be picked up twice a week; Autumn varieties, like Maiden Blush and Duchess of Oldenburg, once a week; and the Winter sorts need to have their drops picked only once a fortnight. These drops must be destroyed.

The picking up of the drops is a great deal of work and expensive. Spraying is easier and cheaper. In a well-cared-for orchard where the trees are sprayed for the second brood of Codling moth, sometime in June, there should be little or no damage from the apple maggot. But should there be, then make two or three subsequent sprayings, using sweetened arsenate of lead. All flies like sweets and this fly is no exception. Mix it as follows: 25 pounds of cheap molasses or confectioners' glucose, five pounds arsenic of lead (paste) in 100 gallons of water. This may be washed off by rain, in which case it should be renewed. The sweetening may be added to the Codling moth spray if desired. How the fly feeds may be interesting. When feeding the head is occasionally raised, the mouth parts are extended and a large drop of saliva is foreed out and applied to the surface of the fruit. This is evidently used as a solvent of its food, and is soon licked up again. So if the fruit is covered with a sweetened poison, it is taken up in the saliva and the insect dies. But they die slowly; for it takes them hours or even days to succumb. However, as it is two or three weeks after the adults emerge from the ground before they commence egg-laying, one need not worry about [illegible] dying by inches, so long as the poison is put on in time. An individual fly is capable of laying from three to four hundred eggs.

Cultivation will, no doubt, go a long way to hold this pest in shape. They usually pupate in the top inch or so of soil, but you cannot destroy them by plowing under, for they will not die. But if there is maintained on the surface of the soil an inch or two of dust mulch it may kill them for they do not seem to be able to exist in dry soil, even when they are in the pupa or chrysalis stage. Any reader who wants to learn in detail of the experiments which were conducted to prove that spraying will hold the apple maggot in check, should apply to the Cornell Experiment Station, Ithaca, N. Y., for bulletin 329. P. T. B.

Gathering Medicinal Roots.

Can you give me any information on drying and care of roots, such as burdock, etc., or can you direct me to buyers of such? I understand the U. S. Department of Agriculture issues a pamphlet bearing on care of such roots. H. C. M.
Goshen, N. Y.

Medicinal roots, such as burdock, yellow dock, poke and dandelion, when collected for the drug market, are best dug in late Fall or early Spring before growth has started. They should be freed from all earth and foreign matter, such as stones, sticks and bits of other vegetation, and especially with the dock and dandelion, from the necks or tops, which turn black in drying. Curing is effected by drying on racks or lath screens, or in thin layers on clean, well-ventilated barn floors or lofts. The large pieces should be split or sliced to facilitate drying, which requires from three to six weeks, according to the weather and character of the roots. They should be turned once or twice daily until thoroughly cured, when they should readily snap if bent. If dried out of doors they should be exposed to light and air, but as a rule shielded from direct sunlight, and be well covered at night and during moist, rainy weather. Artificial heat from stove or steam piping in a well ventilated room is very effective in finishing the curing process. Moderate temperatures, rarely exceeding 85 degrees, are safest for this process. Cured root should be stored in a dry, airy place, free from vermin, until ready for shipment, which may be made in clean bags or dry, clean barrels. The market is with the crude drug dealers found in most large cities. The price paid to collectors or growers of drug plants vary according to the abundance or scarcity of the species and the labor involved in getting the material ready for market, and are often distressingly small. Dock root ranges from three to five cents the pound, according to quality, dandelion from nine to 12 cents, and poke root, well sliced and cured, from four to six cents. Crude drug roots are usually bought by sample, which should be submitted to the buyer before making shipments. V.

Compact Lettuce Wanted.

In setting out lettuce, is there anything that can be done to make it come to a more compact head? J. B.

The above question is rather vague as to its exact meaning, as there are two classes of lettuce grown, the head varieties and the non-heading or loose varieties. For the first class, or head varieties, good soil, proper care and seasonable weather are required to make good solid heads. This second class or non-heading varieties, will not produce good heads under any conditions. To grow good head lettuce the ground should be heavily dressed with well-rotted manure, spaded or plowed in, and if available apply a good wheelbarrow load of hen manure to each 250 square feet of surface, and work well into the soil. Set out this first batch of plants as early as it can be safely done. A second planting may be made 10 days or two weeks later. For several years I have made it a practice to make not over two plantings of plants raised in the hotbed, but sow the seed thinly in drills in the open ground where the plants are to stand. The first sowing is usually made about the middle of May. When the plants are about two inches high, they are thinned out to stand six to eight inches apart in the row. The plants removed are fed to the chickens or thrown away. By this method of planting, the plant's growth is not checked, and they will make more good heads and in much shorter time than by any other method of handling. The May King and New York lettuce handled in this way will make a goodly percentage of fair-sized heads, during the hot weather of Summer, if not allowed to suffer for water and properly cultivated. Lettuce should be cultivated every seven to 10 days if good solid heads are expected. The following sorts of head lettuce are standards for productiveness and excellence of quality: May King (first early), Big Boston and Salamander (second early), New York (main crop). K.

Spring Seeding to Grass.

I have a piece of land with a southern exposure that I limed well last Spring. Then I plowed and harrowed it, and sowed it with corn and planted one-third with potatoes. It has a sandy loam soil. I would like to sow it with grass, so I can get a good crop of hay next Summer. It is now just as I left it with the corn stubble. J. H. A.
Danbury, Conn.

This Connecticut inquirer can hardly expect a good hay crop by seeding in the Spring with the ordinary grasses and clovers alone. If the land is manured after plowing and the seeding can be done quite early this method might give good results in wet seasons, but generally it is better to seed with a grain crop grown for hay. I would advise seeding with oats, two bushels per acre, and Spring vetch seed one-half bushel per acre, and add to these one peck of Timothy, two quarts of Red-top, and 10 pounds of a mixture of six or seven pounds Red clover, four quarts, and four or three pounds Alsike clover, two quarts. Of course if a grain drill is used the oats and vetch seed should be sown in the grain seeds and the clover and grasses in the grass seeds. The oats and vetch will make excellent hay for cattle or horses, and the crop can be got off the land by the 10th to the 15th of July in Southern Connecticut, then giving the clovers and grasses a good chance to make a heavy growth before Winter. With the chances of dry season during May and June a Spring-sown crop of meadow grasses and clovers is quite an uncertainty, so that it is usually safer to grow a cereal crop as hay, and to depend on the balance of the season to develop the hay crop. C. S. PHELPS.

"ROAD building requires a great deal of study." "Yes," replied Farmer Corntossel; "out our way everybody got to studyin' how he could get a salary out of the fund before anybody was paid to get out an' work. The trouble with the study of road building is that too much of it is mental arithmetic."—Washington Star.

DIBBLE'S SEED FARMS

HEADQUARTERS FOR FARM SEEDS

If you want good crops, you must plant *good* seeds. Dibble's Seeds are not ouly good seeds but they are the *Best* Seeds money can buy. We are extensive Farmers and Seed Growers located in the Genesee Valley of Northwestern New York. Honeoye Falls is in Monroe County, the second county in the value of its agricultural products in the United States.

We are located where Farm Seeds are actually grown. Our 1,600 acre Seed Farms are well tilled, very fertile, productive and profitable. Our warehouses are 400 feet in length, and at this writing have over 100,000 bushels of Farm Seeds in store, and we sell direct *from our Farms to yours.*

We have but one grade, and that the best obtainable. Better seeds than ours cannot be had, nor can you get the same high quality elsewhere for so *little money.*

Dibble's D. B. Brand

Northern Grown Alfalfa, Clover and Timothy Seed 99.50 Pure

or better is the "Cream of the Crop," the same as we use on our own Farms growing 600-800 tons of hay yearly. We have about one hundred acres of Alfalfa producing around four hundred tons annually. Our experience is worth thousands of dollars to you. Alfalfa and clover seed is cheap this year and the quality was never better.

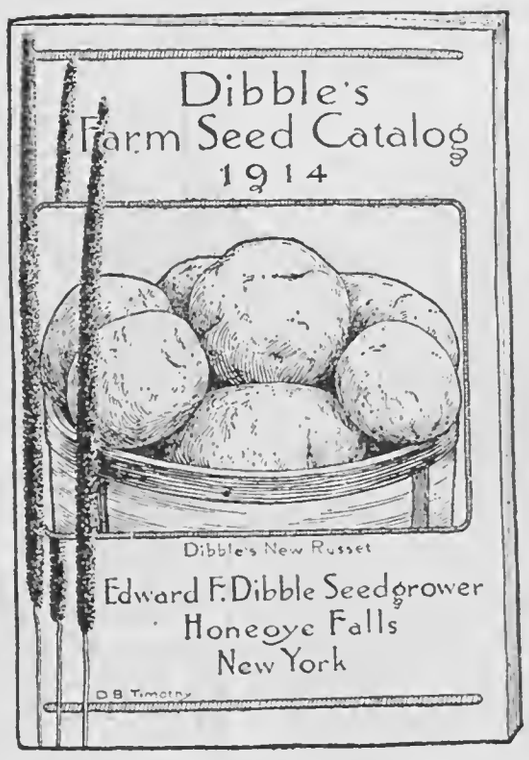
Dibble's Seed Corn

is in a class by itself. Our requirements are that it must be from hand-selected ears, thoronghly dry, screened and recleaned, and must show a germination of above 90%. Germination tests made to date average over 95%. In fact, real *Seed Corn.* If you are interested in Flint for husking, we can supply you with a variety that has made 230 bushels per acre and has produced 247 bushels from one peck of seed. In Dents for Crop or Ensilage, we have an extra early to use where seasons are short and a big grower maturing in 100-110 days, which we recommend for general use; also a Mammoth White, growing 15-20 feet high under favorable conditions, called by one of our customers "King of Ensilage Corn." We have five silos, grow 100 acres for ensilage annually, and have proven by field trials the best varieties for the Eastern States.

Dibble's Seed Oats

New Heavyweight originally from the cold Northwest, early, big stiff straw, enormonsly productive with thin hulled grain weighing 40-45 pounds per bushel. One field produced over 1,000 bushels last year, averaging 87 bushels by measnre, weight 43½ pounds, or *118 bushels per acre* by weight.

Twentieth Century introduced by us several years ago. Scores of farmers have reported yields to us of from 80-110 bushels per acre, and on our own farms growing from 100-200 acres annually, they have produced over *twice* the average of the United States for the last dozen years. Owing to a bumper crop of oats in our section prices are very low.



Dibble's Seed Barley

New early Six Rowed from Wisconsin yielded 55 bushels per acre right here in Western New York last season, and Dibble's Canadian Six Rowed with a twenty-year record of from 40-54 bushels per acre on the Dibble Farms.

DIBBLE'S ALFALFA, CLOVER, TIMOTHY, CORN, OATS, BARLEY, etc., are sold on a ten days' approval your-money-back-if-you-want-it plan, subject to your test, the test of your Experiment Station, or that of the Department of Agriculture in Washington; the fairest, squarest deal ever given the American Farmer by any Seedsman.

Dibble's Seed Potatoes

are northern grown, from select stock seed, and are grown under climatic conditions and in suitable soil for the best development of each kind. After harvest they are carefully assorted and stored in our frost-proof storage cellars and reassorted into new barrels or sacks the very day orders are shipped to our customers, thereby assuring them of choice, properly selected stock that is free from frost, sure to grow and produce crops that pay big profits. We have full stocks of all the standard sorts—Cobblers, Six Weeks, Rose, Queens, Manistees, Moneymakers, Giants, Gold Coins, Green Mts., Rurals, Raleighs, and a score of others; also a *new main cropper* introduced by us two years ago, that should be grown by every farmer. Several hundreds of our customers who have tried it write that it has *outyielded all other varieties in the same field,* and over *one hundred* say that *it beat other kinds over two to one.* Try Dibble's new potato; grow *two* tubers where *one* grew before and *double your crops.*

60,000 bushels of Seed Potatoes awaiting your orders, and at a price you can afford to pay.

Dibble's Farm Seeds Free

Send us your name and address on a postal card, mentioning the number of acres you are farming, and we will send you free *ten liberal packages of Dibble's Farm Seeds* for testing on your own farm, and also *Dibble's Farm Seed Catalog,* the leading strictly Farm Seed Book of the year. *Dibble's Catalog* is written by a *Farmer* for *Farmers.* It tells the truth about the Farm seed situation. Illustrations are all from photographs. It is a safe guide for every Farmer as it gives the result of our own experience farming 1,600 acres. It contains a map showing how near Honeoye Falls is to *you.* Write for it *Now.*

Address EDWARD F. DIBBLE SEEDGROWER, Honeoye Falls, N. Y. Box B

Summer Bedding Plants.

For a showy display in the flower garden, nothing else gives such quick returns as Summer bedding plants. The picture shows such a bed, the central group of Cannas attaining noble proportions. Few other plants suited to this latitude give such a striking tropical effect. The roots may be kept over year after year, in a frost-proof cellar. In raising Cannas from seed remember that a little nick should be filed in the horny covering, or the seed soaked in hot water long enough to soften, otherwise there may be a failure in germination. Sow in hotbed, or in pots in the window.

Raising Show Chrysanthemums.

Would you give me instructions how to raise those big Chrysanthemum *trees* we see in the shows, and which are the best varieties for this purpose? To produce large Chrysanthemum flowers, does it make any difference whether they are grown in pots or planted in the open ground and later potted? W.

Central Islip, N. Y.

For large bush plants of Chrysanthemums, cuttings are taken early in February. They need a cool airy greenhouse, where they may be grown without any check, so as to make vigorous plants. They are repotted as often as required, the final potting, usually in June, being into 10-inch or 12-inch pots. When shifted, pot moderately firm and water moderately until the plant is making good root growth. The preferred soil is a compost formed by piling up, the previous Fall, freshly cut sod in layers with half its bulk of partially rotted manure. This is cut down and well mixed, forming a fibrous loam excellent for greenhouse use. The Chrysanthemum is a gross feeder, requiring a rich soil, and in bench culture both top-dressing and liquid applications are resorted to, but over-feeding results in malformed foliage or defective buds, and the grower must study his plants carefully, for all varieties cannot be treated alike.

A SHOWY FLOWER BED.

As soon as the young plants are five or six inches high, the top must be pinched out, to induce branching, and as growth continues some pinching out may be needed almost daily, to induce as many breaks as possible, and to insure symmetry. The desired shape must be kept in mind, and the plant gradually staked out; by the middle of August this is very important and work must be done every day, as the shoots must be tied in place before they harden. Plants of moderate size may be spread out on stakes, but the monsters of the flower shows are trained over umbrella-like wire frames. Varieties that have been shown in magnificent form at our flower shows are Wells' Late Pink, Lady Lydia, white and R. T. Felton, deep yellow. From the frequency with which these varieties are grown for large specimens it is evident that they are dependable under such treatment. Merza is another white that makes a fine bush or standard. Standards receive the same treatment as the bush plants, except that they are not stopped to form the head until from three to five feet high; they are then pinched and tied to secure a symmetrical head, with the same care as bush plants.

The large exhibition flowers are grown on single-stem plants kept in pots. They are restricted to one stem and flower; whether crown or terminal bud, and the time of taking it, depends on the variety. Many growers plunge the pots outside in Summer, as the sun and air induce a short vigorous growth, but conditions are not always favorable to this. Little bush plants of some varieties may be planted out all Summer, and potted about the first of September. Every grower has some little individual "kinks" in Chrysanthemum growing; you will find the general practice discussed very practically, week by week, in the florist trade papers.

Bud Variations in Carnations.

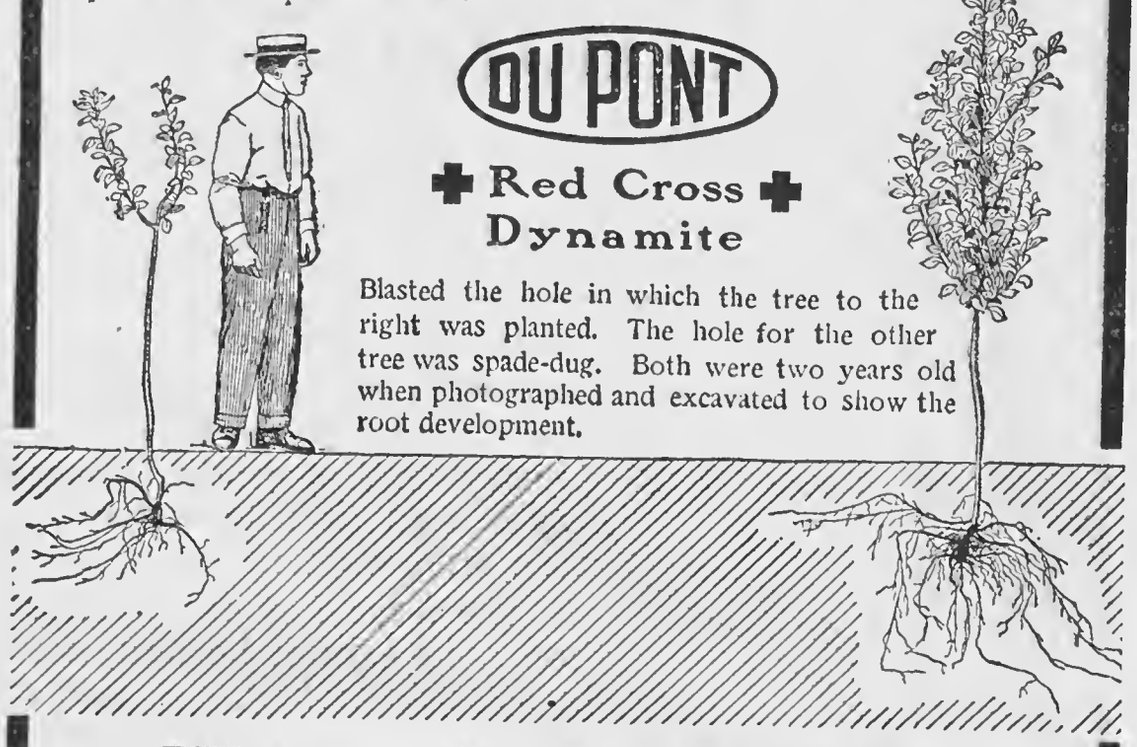
Florists' flowers offer an especially interesting field for the study of "sports" or bud variations, because the plants are under constant close inspection. Any change is quickly noticed, while rapid propagation and flower production permit a prompt estimate of the value or permanence of the mutation. On page 1066 of last year's columns we referred to the history of the Bride rose; it will be interesting to trace these variations among carnations. As an example, Enchantress is a leading commercial sort, widely grown under different conditions. Enchantress itself was a seedling, its parents being Mrs. G. M. Bradt, white striped with scarlet, and Mrs. Lawson, clear pink. The original Enchantress was a light pink, similar to Daybreak, a famous old sort now retired for lack of size. Apparently Enchantress is addicted to bud variations, for we hear of sports in many different localities. Those already prominent commercially are White Enchantress, Rose Pink Enchantress, Washington (a deep rose pink), Salmon Beauty and Enchantress Supreme. The two last named are both clear salmon, quite distinct from the Daybreak pink, or the deeper rose of the earlier sports. We are told that occasionally Enchantress Supreme shows a red-flecked flower, which would suggest that the character of Mrs. Bradt, recessive in Enchantress, is asserting itself in the salmon mutation. Here we have the progeny of two very distinct carnations, differing from either parent, suddenly sporting into several varying forms, all of which are fixed under extensive commercial propagation. Surely the fruit grower has as much reason to study these mutations as the florist: not for scientific interest alone, but because his normal profit may be eliminated by a sub-normal variation in quality of product. That this idea is not exaggerated is shown by recent investigations referred to in THE R. N.-Y.

A GENTLEMAN, going into his stable one day, found his little son astride one of the horses, with a slate and pencil in his hand. "Why, Harry!" he exclaimed, "what are you doing?" "Writing a composition," was the reply. "Well, why don't you write it in the library?" "Because the teacher told me to write a composition on a horse."—London Farm and Home.

LITTLE Grace, six years old, is the eldest of a family of four children. Not long ago she was admiring a new arrival at a neighbor's house. "You seem to like my baby," said the mother of the n. a. "Don't you want to take her home with you?" "No thank you," answered the little girl, soberly. "We born our own babies."—Cleveland Plain Dealer.

Which Tree Do You Want?

The slow-grower, with few and shallow roots and fruit of poor quality, or the vigorous, quick and steady producer of prime fruit?



DU PONT

Red Cross Dynamite

Blasted the hole in which the tree to the right was planted. The hole for the other tree was spade-dug. Both were two years old when photographed and excavated to show the root development.

THE ROOTS TELL THE REASON WHY

Dynamite set trees bear fruit one year earlier. Write for Farmer's Handbook No. 249 F, and learn how to stop first year losses and get quick profits.

BLASTERS WANTED

Many farmers prefer to hire blasters. Demand exceeds supply. Reliable men taught free and helped to get work. $200 capital needed Write for free booklet No. 249 B.

DU PONT POWDER CO., Wilmington, Del, Established 1802

The "JOY" BLACKBERRY

brings joy to all who grow, sell, or eat it. It is immensely profitable to the market grower, and "a joy forever" to the amateur gardener. The canes are of ironclad hardihood and need no staking. They yield heavily, *all* the canes being literally loaded with fruit every year.. I have tested this berry for several years, and am willing to stake my reputation upon it. In the winter of 1911-12 every Blackberry in my trial grounds was damaged more or less *except the Joy*, which came through with every bud and terminal in *perfect* condition.

Grow This Berry. It is Hardy and Wonderfully Productive

JOY Blackberries are coal black, and large, almost as thick through as they are long. In luscious flavor they surpass by far all other Blackberries I have ever grown. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other fungus disease, and I believe it is immune to them.

A full assortment of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Garden Roots, Hardy Perennial Plants, Shrubs and Vines, Evergreen and Shade Trees, Roses, Hedge Plants, etc. Illustrated descriptive catalog replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed. Prices low.

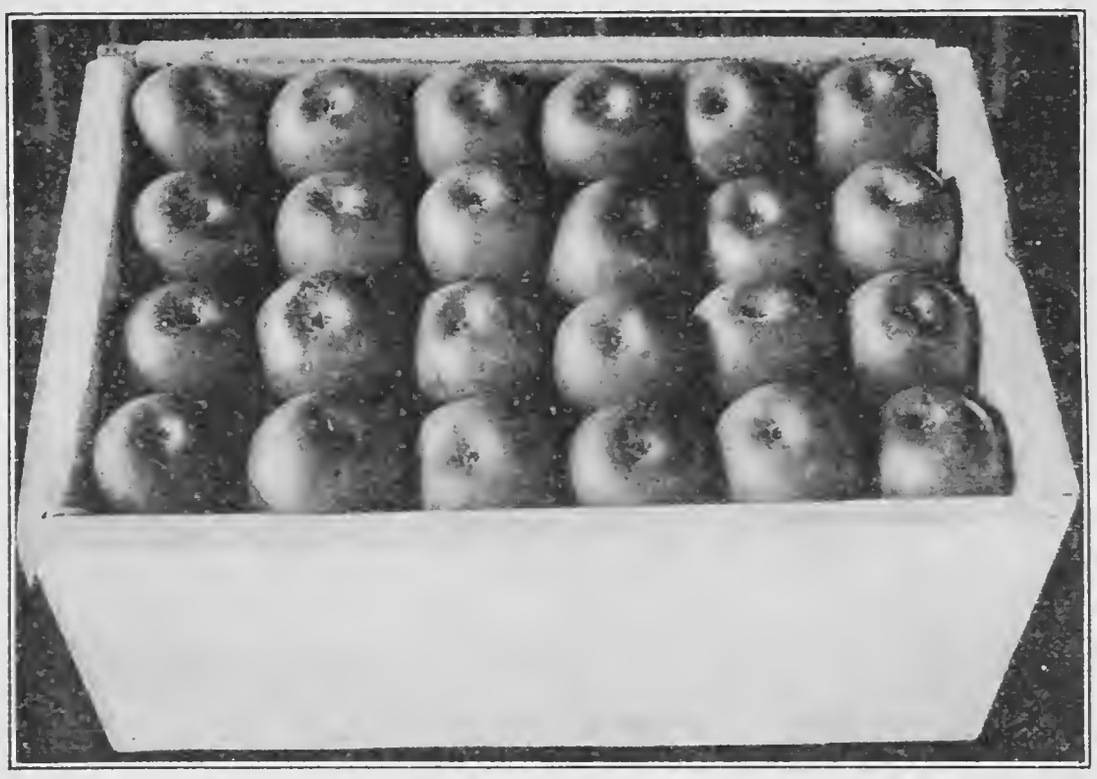
BATEMAN M'F'G CO. Box 1022 Grenloch, N. J.

APPLES FROM A VETERAN TREE.

By parcel post I am sending you a small box of Albemarle Pippins from a tree in Nelson County, Virginia, said to be 131 years old. It occurred to me that you would be interested in seeing and perhaps tasting apples from a tree of such an age. The apples were grown by Mr. W. H. Goodwin, at Avon, Virginia, and the tree is located in Nelson County, about 15 miles west of the main line of the Southern Railway. Mr. Goodwin states that there are about five of the old trees, all about the same age. They had been neglected for a great many years. A few years ago he trimmed them up and put them in pretty good shape. The crop last year on the particular tree from which these apples were picked amounted to eight barrels.

You have, of course, seen Albemarle Pippins which are much finer than these, but they were grown on trees which had been cared for from their infancy, and I doubt if your attention has been called to apples of good commercial variety and character grown on a tree of such age. This tree, if reports are correct, is evidently several years older than the famous Handy tree in Patrick County, and also older than the Hall tree in Patrick County, which have been written about a great deal. The Handy tree is reported to have produced 132 bushels of apples in one season and the Hall tree 165 bushels. I understand that the Hall tree grows what may be termed a commercial apple; the Handy does not. This old Nelson County tree, however, produces one of the best selling apples grown in the United States. Good Albemarle Pippins, at this time in Virginia, are bringing from $3 to $5 per fancy box. At $3 a box the crop of this old tree in 1913 would be valued at $72. In cut above is shown a picture of the box from which these apples were taken.

M. O. RICHARDS.



APPLES FROM A 131-YEAR-OLD TREE.

APPLES ON LONG ISLAND.

PART I.

Because of the prizes that have been awarded my fruit at the New York State Fairs of 1912 and 1913, THE R. N.-Y. has asked me to write my experience with and opinion of such apples as I grow.

DESCRIPTION OF ORCHARD.—As now planned the orchard consists of 105 acres, of which 77 acres are in apples, 15 acres in peaches, five acres in pears and eight acres in cherries, plums and other fruits and nut trees. The apples were planted 31 acres in 1902, a few of which were planted in Fall of 1901, 13 acres in 1903, eight acres in 1906 and 25 acres in 1907. Soil varies from a good sandy loam to a light sandy soil; of the 25 acres planted in 1907, 12 acres were on a light sandy soil, and have not made a satisfactory growth.

LOCATION.—This is on the eastern end of Long Island on the west portion of Shelter Island, surrounded by and close to salt water with natural woods as wind-breaks protecting the orchard trees on west, south and east; the prevailing wind is southwest. Land is rolling and well surface drained. Temperature is influenced considerably by the large bodies of water surrounding the orchard; the Summer temperature being lower and the Winter temperature higher on this account. Nothwithstanding the water surroundings the air is dry and we are favored with many clear sunlit days, the sunshine coloring our fruit well, as evidenced by the prizes taken at the State Fairs.

PREPARATION OF GROUND for planting: I find that when the plantings were made in ground well cultivated previously, better results are obtained, my only poor planting being in light sandy soil which had been cleared of brush, plowed, harrowed and planted at once. Planting was done in holes dug about two feet square and 16 to 18 inches deep, top soil used in filling and well firmed by shaking and tramping around and on the roots. After planting, manure or fertilizer was put on to give the tree a start.

PLANTING PLAN.—The orchard is planted on the hexagonal system, each tree being equally distant from six other trees surrounding it. In planting again I would not use this system, but plant in squares. In the system I used more trees can be planted per acre, but that is its only advantage. Cultivation is not so easy and when fillers are used, as I have done, the advantage is very much in favor of planting in squares. From my experience I say plant in squares.

DISTANCE APART TO PLANT.—My trees are all planted 17½ feet apart. When apples are planted apples are used as fillers. Mine are too close. I recommend 20 feet apart in squares for this section when fillers are used. In two or three years I shall have to take out three-quarters of my oldest apple trees to make room for those left; that is, my fillers must come out and come out all at once, as my trees are planted in the hexagonal system. Now if I had planted in squares only one-half of the trees would have to be removed then and the others taken out several years later after getting that many more crops to pay for their planting and care. Do not plant fillers on the hexagonal system. On the square system if fillers are planted and trees 20 feet apart, removing every other line of fillers (one-half of the trees) the trees are left 28 feet three inches apart in squares. A few years later the remainder of the fillers may be removed and the main trees left 40 feet apart in squares. When it is intended to grow crops in the orchard when the trees are young and until they come into bearing, no fillers should be planted, as with fillers there is no room for crops.

LOW OR HIGH HEADS to orchard trees: Mine are all low heads, Western style, branching from 18 inches to three feet from the ground. Some of mine are too low and interfere in cultivating. From my experience I would plant now with branches from 2½ to four feet above the ground; that is the lowest branches about 2½ feet from the ground and the highest four feet above the ground. The advantages of low-headed trees are many; easier sprayed, thinned, picked and trimmed, less exposed to wind and fewer apples blown off in storms.

PETER ELBERT NOSTRAND.

CALLER: "But you said you wouldn't charge me anything for the little legal question I asked you." Lawyer: "I haven't. What I've charged you for is the answer."—Boston Transcript.

FRUIT TREES

1847 : CAYUGA NURSERIES : 1914

For Thirty-five Years Under Their Present Management

H. S. WILEY—the man who stands behind Wiley's dependable trees

Reader You must know that healthy trees, true to label and up to grade specified are the only kind a man can deliver and stay long in the nursery business.

Read "I began planting your trees in 1899. To me it is a rare and remarkable circumstance that your trees have always been found true to label, healthy and free from disease. From a 10-year-old Wolf River orchard I picked this season as high as thirteen bushels from some of the trees. I want to make it emphatic that your trees do not travel under an assumed name.
HARRY W. LITTLEFIELD, Waldo Co., Maine.

Growth of our business has been such that we now have large plantings at Cayuga, Lyons, Rochester and Dansville, N. Y. While we give every care and detail necessary to the filling of small orders, our business is more largely confined to supplying commercial planters.

One example of growth. Some thirty years ago we filled an order for 300 Baldwin trees for a planter in Kennebec Co., Maine; we now send annually trees in carload lots to that county.

VALUES.—Our free CATALOG will advise you of our values without any extravagant promises. WE HAVE NO FAKE WHOLESALE PRICES. Our purpose is not primarily to grow a cheap tree, but the best tree that can be grown and placed in the hands of the planter in a fresh condition.

Our stock of FRUIT TREES never was more complete or better in any respect. A complete line of ***fruit trees*** for the ***orchard, bush plants*** and ***roots for the garden*** and ***ornamentals*** for the ***lawn.***

ENDORSEMENTS.—The character of our endorsements are unlike many others. Why? Because they come from planters who have been fruiting our trees for a quarter of a century more or less. They deal with WILEY'S TESTED TREES that have made good and are making good all over the country.

Read the following, and we can multiply this many times:

"I have been planting trees for twenty-five years and want to say that when it comes to grading up fruit trees and labeling them correctly, I can depend on you. My trees never disappoint me in the variety ordered from you. The last 1,400 peach trees planted came into fruiting this past summer and were all true."
F. D. GARDNER, Niagara Co., N. Y.

PARCEL POST.—A full page of our catalog is devoted to parcel post values.

Our pamphlet on Suggestions, Pruning, Spraying, Selection of Varieties for various localities will be mailed with catalog on request.

10 Extra Quality Baldwin 2-Yr. Trees $1

We want every fruit grower and farmer to become acquainted with our nursery stock by sending for and planting these apple trees this spring. The above offer is exceptional. It is made possible because we grow these trees ourselves and sell them

DIRECT TO THE PLANTER WITHOUT PAYING AGENTS' PROFITS.

Every fall we import inspected French Seedlings that must come up to our standards for straight trunks and strong roots. They are stored in our stock cellars until spring, when they are planted. Careful cultivation and grubbing makes them grow strong in our soil. About July first these seedlings are budded with scions taken from trees of known merit. This important work is under the personal supervision and has the entire attention of Mr. Denton, a nurseryman of 25 years' experience, who also directs the cultivation through the year and directs the "heading" the second spring. This care on our part insures nursery stock that we

Guarantee True to Name, Free from Diseases or San Jose Scale

and as sturdy, well-rooted and branched as trees can be made to grow.

You take no chances in buying such stock; you lose surely if you do not take advantage of this special offer. Baldwins bring top market prices, keep well, have the color and flavor. You can't make better use of a quarter acre, especially if you interplant these 10 Baldwins with some of our Peaches, Plums, Pears, Cherries, Quinces or Small Fruits, of which we have over 700,000 to sell this year.

The 10-for-$1 offer for selected 2-year Baldwins holds good only as long as they last. Only 10 to each individual. Send $1 at once and trees will be held for you. Write for special prices on your list, FREIGHT PAID.

Send for Free Catalog at once and order early.

How Much Wood Growth Desirable?

It is about as hard to determine how much a tree should grow in a season, as to fix the proper increase of weight for an animal. One tree may make a growth of six feet in a season and remain vigorous and healthy, while another alongside may not make half as much growth and not be as healthy. I aim to secure a rapid growth early in the season, and by means of a cover crop, check the growth in time to ripen properly before Winter sets in. I have a young peach orchard which has been planted two seasons, which the past season made growths of five or six feet in many instances. This is probably excessive, and two-thirds as much would have been safer.

Contrary to my usual custom, I grew strawberries in it last season, and the late cultivation allowed the growth to continue longer than usual, and if conditions had not been favorable for ripening, there would have been considerable danger of winter-killing. I like to secure in the young trees as rapid growth as is consistent with health in order to secure a large bearing surface, and the capacity for large crops, as soon as possible. After a few years' growth, however, I try in the case of apples, to induce fruitfulness by a slower growth and less pruning for a few years, until the energies of the tree are diverted into that channel, when I again resume pruning and feeding. I have old bearing peach orchards that do not make over a foot of new growth annually, but that is usually caused by a very heavy crop the previous year, and is below normal. If I have a pear or apple tree which has not attained its full size, I am not satisfied if it does not make more than a foot of growth, unless it have borne a heavy load of fruit. If it has borne nothing and is under 15 years old it should make from one to two feet at least, depending on varieties.

Of course a tree 25 or 30 years old, and bearing crops, will not make much growth, perhaps often not more than six inches. Some trees concentrate their energies on a few limbs of long growth, while others form a multitude of small branches of shorter growth. I believe a greater annual growth can be safely produced where the tree is fed a properly balanced ration, than where there is a deficiency of any element of plant food, or of moisture. We expect the peach to mature earlier than other trees, and also to begin bearing younger, hence we expect more rapid growth, and I find no trouble with growths of three or four feet annually, provided it is secured early in the season, and from properly balanced rations. Once a tree "gets the habit" of bearing heavily, there is not much danger of excessive growth.

Ohio. W. W. FARNSWORTH.

Girdling Trees.

You speak of girdling trees. How do you do it, and at what time of the year? Is it just applied to apple trees?

Lamar, Mo. K. B. D.

Girdling trees to make them bear can be done successfully and safely if the proper precautions are observed. There is almost no danger whatever in girdling apple, pear and quince trees, but peach, plum and cherry trees would die from the same operation at the same time. This is because they do not heal over the wounds as the pome fruit trees do. The time to do the girdling is when the trees are in their most vigorous state of growth, which is usually in June, and that is when I have always done it. A ring of bark from one to four inches wide should be taken out entirely around the trunk of the tree, but care should be used that the slimy cambium layer under the bark is not mutilated. From this soft matter the new wood and bark is formed. The interruption of the circulation is what checks the growth and causes the formation of fruit buds much more abundantly than would naturally occur. To run a knife simply through the bark, making a ring around the tree in one or two places will have considerable effect. So will binding a wire very tightly around the trunk or a branch and removing it after the season of growth is over. It chokes off the circulation in some measure, and causes fruit bud formation. But the removal is necessary, or there might be permanent injury. H. E. VAN DEMAN.

Importing Fruit Trees from Europe.

On page 38 I note an inquiry about importing fruit trees from Europe and as I happen to be well posted on the subject by practical experience, I am led to reply. After passing my three-fourth century milestone (seventy-fifth birthday) I determined to make a change in my occupation, and having been familiar with dwarf fruit tree culture in my young days in the "Old Country," I decided on taking up that subject for further experimentation and established a dwarf fruit tree nursery, and sent to Europe for a stock for propagating dwarf trees on Puget Sound (a country admirably adapted to the purpose). My first shipment consisted of Doucin and Paradise apple stock, Myrobalan plum, Angers quince, Mahaleb cherry. These I procured from France, and had them shipped to New York by steamer, where I had a consignee who received them and instructed him to pay custom duties and all other expenses. I had him ship the stock to me at this place, which altogether made a journey of over 6,000 miles. Then I procured a shipment of stock of one and two-year-old dwarf apple, pear, plum, cherry, peach, nectarine and apricots, with small fruits consisting of currants and gooseberries, etc. These were shipped to me from Southampton via. New York, and then across the continent to Puget Sound. Both these shipments arrived in good order, arriving in 30 days from Southampton at a cost of over 100 per cent. advance over prices of stock at the nursery in Europe.

My next and most of my future orders I had sent by "parcel post," which I then began to exploit. It must be remembered here that this was four years before parcel post was introduced in this country, never thought I could at that time procure an unlimited number of packages from Europe provided none weighed over 11 pounds. I found the parcel post admirably adapted to my requirement as dwarf fruit tree nurseryman with the advantage of requiring only 15 days for transportation of over 6,000 miles and all the importation charges, such as freight, brokerage, transportation, docking, wharfage, were eliminated and covered by the postal charges on each parcel, while the duty was collected by the local postmaster at this end, which reduced the importation charges over and above the nursery price less than 50 per cent. advance on shipment. Thus I continued my work until 1913, with the fullest satisfaction, when I had to send for a shipment (to fill up shortages of certain dwarf stock) to my correspondent in Europe, instead of receiving which I received a notice that the United States Board of Horticulture had issued new instructions as to importation of fruit trees from Europe; that importer should first procure a permit from the Board of Horticulture in Washington, D. C., naming a list of the varieties required, and address of the grower in Europe where they were to be purchased. This permit was issued in triplicate, one copy of which was to be filed with the Board at Washington, D. C., one to be forwarded to the custom house at port of shipment, and one retained by importer. Then the U. S. agent resident in London would appoint an expert to examine the stock at the nursery provided a fee of $10 and probably $10 or $15 more for traveling expenses, etc.

But that was not all, for in their bureaucratic wisdom and high mightiness they prohibited in toto the privilege of parcel post being allowed any nursery stock whatever! And this I called the death blow to my nursery! Having now reached my eighty-first year the only thing I could do and avoid unnecessary worry at my time of life was to close my nursery, which I have already done. While the foregoing is the present state of matters, were I a younger man I would still hold on until the Panama Canal is open, when nursery stock may be shipped by passenger steamer from Southampton via New York in bond, to forward on the Pacific coast or via Panama Canal, eliminating the overland charges by rail as well as all liability to snow blockades and at much less cost than the overland rates from New York to the Pacific coast at present.

Whatcom Co., Wash. A. W.

You Can Depend Upon

Allen's Strawberry Plants

Strawberry growers must set out plants that will thrive and bear fruit true to name. You cannot afford to take chances with carelessly grown plants.

Buy Allen's True-to-Name Plants

and you are more certain of large crops of big, delicious strawberries. Allen's plants are hardy, vigorous and heavy yielders of luscious fruit because they are carefully grown from healthy stock.

All Standard Varieties—Any Quantity
Prompt Shipment

All the early and late strains of standard varieties of strawberries for every soil and climate requirement. Over 120 acres are devoted to strawberry culture alone at the **Allen Nurseries.** Over 29 years' successful experience growing berry plants of the best quality. Allen's plants are carefully selected and packed **fresh** for shipment and **guaranteed true to name.**

Here's What Customers Say:

From California—Plants arrived today in fine shape. The growers in this locality as well as myself are delighted with them. D. R. DUNCAN, Los Angeles County.

From Missouri—Received plants O. K. They surprised me. So fine, packed nicely in bunches, with roots all straight down, one plant like the other and no scrubs in them. JOSEPH VOGEL, Jefferson County.

From Montana—The plants came through quickly and in fine condition. MATT W. ANDERSON, Lewis and Clark County.

From New York—Wish to acknowledge for the Station receipt of strawberry plants. Arrived in good condition. A. M. TAYLOR, Geneva, N. Y.

From Florida—Plants received in fine condition and everything satisfactory. I. W. PECK, Manatee County.

Write for 1914 Berry Book

Tells how to plant and cultivate strawberries and other small fruits. It lists and describes Allen's True-to-Name Blackberries, Raspberries, Strawberries, Currants, Grapes, Asparagus, etc. Well illustrated and full of valuable information for fruit growers and gardeners. Pruning the Grapevine.

I should like very much to read an article on how to prune grapevines and blackberries. I should like to know more about pruning in general. H. O. J.
Toledo, O.

In answering this question I assume that some system of training has been decided upon, and that the vines are but recently set. It is the usual practice to cut back all the growth of the first year back to two or three buds. This gives the root opportunity to become well established. The canes that develop from these two buds, if the vine is vigorous, are tied up the following year, which is the third growing season. These may be tied along the lower wire, obliquely to the upper wire, one cane to the lower wire and one to the upper, or one cane only to the upper wire, which is about 4½ feet from the ground. The second year after it is carried to this wire two canes are laid down along it, one extending to the right, the other to the left. Each

TRAINING THE GRAPE IN SOUTHERN NEW JERSEY.

year but two canes are kept for fruiting wood, along with sufficient spurs to provide for these canes the following year. For the amateur the high-renewal system offers a very satisfactory plan. A trunk or stem is carried to just below the lower wire, which is 18 or 20 inches from the ground. Two or three canes may be retained for the fruiting wood along with spurs of two or three buds, that are to furnish these canes the following year. Two of these canes may be tied along the lower wire, while the third is carried to the second and tied along it. The trellis consists of three wires. One cane may be tied along the lower wire and the two carried to the second, and there laid down. As soon as the shoots from these canes have made growth that reaches the wire they are tied to it by string, raffia or rye straw. Thus all the current year's growth is kept off the ground.

The pruning the following year consists of cutting back the previous year's growth to two or three canes and a like number of spurs. The only wood that is left each year, older than one year, is the short trunk reaching to the lower wire or just below. Whether one cane or two are laid down on the lower wire is governed largely by the location of the canes; some are so placed that they can be readily tied in one wire while others accommodate themselves to the other. Thus individual judgment will have to determine the matter. In cases of excessive wood growth four canes may be left, then two canes are tied to each wire. Often when canes are laid down on the second wire the trunk is extended to a point just below it, and the canes are taken from this level. However, this is a matter of choice with the grower. F. E. G.

Dishorning and Pruning Old Apple Trees.

Let me say at once that we do not advocate any dishorning which would be taken to mean a cutting back of large trees to the bare pole-like branches. For the best commercial orchard practice, trees should not be over 20 to 22 feet in height, so it is often an advantage to take eight to 10 feet out of the top of the highest trees. In doing this the plan is to select some wide spreading branch to continue the growth and to cut the top just above this, thus increasing the spread and the bearing surface

We, of course, understand that all dead limbs and branches and all badly cankered branches should be removed and burned at once, to get rid of insects and disease spores which they usually contain. Then we look for branches which cross one another and usually remove the weaker and poorer. If the tree is still too thick at the center we may remove one or more additional live branches. One should always bear in mind some of the fundamental reasons for pruning, viz.:

1. To keep the trees within bounds so as to facilitate spraying and harvesting.

2. To preserve symmetry or form of the tree.

3. To keep the top reasonably open, so as to allow sunlight to pass between the branches and leaves, thus tending to cause the fruit to color well.

In all of the work of pruning one must be careful not to over-prune, for in order to have maximum crops it is self-evident the trees must carry a maximum amount of well-placed bearing wood. This, in the case of the apple, is the younger wood, two, three, four and five years old.

Stubs or shoulders should never be left, as they usually do not heal over but dry out, decay and fall away giving rise to holes in the trees. In removing a branch remove it entirely, cutting close up to and flush with the bark of the trunk or the parent branch from which it sprang. Also a good plan in removing large limbs is to cut one-quarter to one-third way through on the under side first, so as to prevent stripping the bark and splitting the wood as the branch falls. One should take care to paint all cut surfaces over an inch in diameter and thus preserve the wood until nature heals it over with bark. For paint one should use raw linseed oil, white lead and enough lamp black to tone it down to a slate color. A small amount, say five to 10 per cent. of crude creosote oil the same as is used to kill egg clusters of the Gypsy moth, may be added as an additional disinfectant and wood preserver. Turpentine should not be used in paints for covering tree wounds, as it is likely to injure the bark.

THE VAN DUSEN NURSERIES
W. L. McKAY, Prop. Box J, Geneva, N. Y.

A PICTURE is "Proof of the pudding." This picture shows what **you** may expect to do with a dwarf apple tree in one or two years.

We do not generally recommend dwarf trees for commercial plantings, except as "fillers;" but if your hobby is **horticultural novelties,** an apple bush in bearing is surely a novelty. We are offering about forty varieties.

If you are planning a little **fruit garden** for your back yard, twenty dwarf apple trees will thrive on the space required for one full-grown standard.

THIS IS THE WAY OUR
DWARF APPLE TREES GROW

Dwarf fruit trees are used for **ornamental purposes;** you can start with young trees and train them at will. When in bloom they rival all flowering trees and shrubs.

Some folks are using these dwarfs to **combine** a fruit garden with an ornamental effect that is mighty pleasing.

If you enjoy having a garden; or, better yet, if you take pleasure in making things grow and caring for them yourself, you will find the training of these dwarf trees a most fascinating pastime. Send for our **dwarf bulletin.**

We specialize in **PEACH TREES.** A few words as to how we grow them should interest the peach planter. At from three to five-year intervals we renew our peach buds from **tested, bearing trees,** using this stock for not longer than five years and then renewing again. We have for this purpose our testing plot of nearly a hundred varieties, and have access to the State Experiment Station testing orchard of several hundred varieties, right across the road from our own grounds.

Realizing the liability to mixture of varieties in nursery blocks of peach trees, is it not **worth your while** when planting them commercially to get trees grown with the care we exercise in keeping varieties straight? If this interests you, send for our general catalogue and **special peach bulletin.**

JUNE RASPBERRY. It is ripe in **June.** We have it from stock distributed by the New York State Experiment Station, and it is recommended by them. **Postage paid** in lots of 25 or less.

COST OF AN APPLE ORCHARD TO BEARING AGE.

PART I.

There are two principal factors which enter into all costs of production, namely, labor costs and capital or cash costs. Labor costs are principally two, man and horse. The costs of man labor are made up of cash wages, board, lodging and privileges. The costs of horse labor include feed, care, shoeing, stabling, interest and depreciation. Man labor costs us on an average, including board, etc., 20 cents an hour or $2 a day. Horse labor costs 15 cents an hour or $3 a day for a team not including driver. Cash costs are made up of seed (or in the case of orchard trees) fertilizers, including manure, equipment charges, overhead charges, such as taxes, insurance and interest and miscellaneous costs such as packages, spraying materials and the like.

ESSENTIALS IN RECORD KEEPING.—There are two absolutely essential things to do in securing an accurate cost of production, and only two. The first is to make a complete record of all cash expenditures. The second is to make a complete record of man and horse labor. These records must, of course, be so kept that the various costs can be separated and charged to the particular enterprise, area, or crop to which they belong. At Beechwood Farm the cash accounts have been kept in a cash book which differs not at all from the ordinary cash book except that it has a column in which to designate by letter or number, the field or crop to which the item entered is chargeable or to be credited. The labor records are made by the tenant. They are kept in the form of a diary, not unlike the ordinary diary except that it has in three right-hand columns places in which to record in a definite and easily readable form, the field on which the labor was done, and the number of man and horse hours expended. If desired the hours of the day may be written at the left of the page and a line drawn across the page to separate the different items. In other words it is an organized diary—one in which facts can easily be found. The original records are brought together and tabulated once a month so that they can be charged against the crop to which they belong.

With this brief outline of our method of collecting costs in mind, let us examine the costs of growing to bearing age two particular apple orchards, one 11 years old, filled one way with plums and the other six years old filled both ways with peaches. Orchard A was set in the Spring of 1903, 36 feet apart each way. In the Fall of the same year it was filled in the long way of the rows with plums. These plums have never paid as well as they should, and I should not use them again, although they have cost very little. The orchard is about 7¼ acres in extent and contains 475 trees. The varieties of apples are Duchess of Oldenburg and Twenty Ounce, and Tompkins County King worked on Ben Davis stock in the seventh and eighth years. This of course, has delayed bearing. The plum varieties are Burbank, Abundance, Bradshaw and Reine Claude.

Cost of apple orchard filled one way with plums, to ten years:

ITEMS.	Total for the 10 Yrs. Cost an Acre	Cost a 100 Trees
Labor costs (man hr. 20c) (horse hr. 15c), setting trees (inc. staking out, hauling and replacing)	$5.38	$8.54
Grafting	*.34	*1.36
Spraying (once)	1.55	2.46
Pruning and hauling brush	5.69	9.03
Fertilizing and manuring	9.42	14.50
Hoeing	4.03	6.40
Plowing	9.13	14.50
Cultivating	11.13	17.66
Picking (last four years only)	2.93	4.65
Marketing	1.09	1.73
Miscellaneous	1.26	2.00
Total Labor	$51.95	$82.46
Cash Costs—		
Apple Trees inc. replacing 33 at 16c..	$5.28	$16.00
Plum Trees inc. replacing 30 at 16c..	6.46	21.53
Grafts	3.10	12.40
Fertilizer and Manure	9.42	15.00
Cover Crop (1)	1.19	1.88
Spray Material	1.19	1.88
Packages	2.49	3.95
Equipment	6.42	10.19
Taxes	11.03	17.51
Interest 5%	89.50	142.06
Buildings	7.50	11.90
Overhead (9% other cash costs)	16.60	26.35
Management	50.00	79.36
Total Cash	$210.18	$333.62
Grand Total Cost	$262.13	$416.08
Grand total per tree		$4.16

*about 5A 175 trees.

Summary statement of the costs of growing an apple orchard filled one way with plums to ten years of age:

33 Apple and 30 Plum Trees an Acre Set 1903, 18 x 36 feet

	Acre	100 Trees
Total Cost of Orchard at 10 Yrs.	$262.13	$416.08
Net Income of 10 Crops between tree rows	42.20	67.00
Income from Filler	16.87	26.77
Income from Apples	2.82	4.47
Total Income from Land	$61.89	$98.24
Actual Net Cost of Orchard	$200.24	$317.84
Net Income from Apples 11th Yr.	$12.75	$20.24
Net Income from Filler 11th Yr.	18.25	28.97
Total Income from Orchard 11th Yr.	31.00	49.21
Total Cost of the Orchard 11th Yr.	14.27	22.65
Net Income of Orchard 11th Yr.	$16.73	$26.56
Net Income from Crop 11th Yr.	25.78	40.92
Total Net Income from Field 11th Yr.	42.51	67.48
Net cost of Orchard at 11th Yr.	157.73	250.36
Net Cost of Orchard per Year	14.34	22.76

M. C. BURRITT.

Taxation of Apple Orchards.

Will you give me a little information relative to the taxation of apple orchards? 1. Are the trees taxable or only the land they grow upon? 2. If taxable, how much per tree for trees in a thrifty 10-year-old orchard? About 15 years ago we purchased a badly rundown stony piece of land for about $25 per acre. This we set out to peach trees, and secured three good crops, when the orchard had to be cut down owing to yellows. In 1904 we set out an apple orchard, and 1913 was the first year we have had a paying crop. All this time we have been to great expense clearing off stone, making fences, etc. This past year all property in the town has been re-assessed. This orchard has been assessed for $125 per acre, while just over the fence one of our neighbors pays taxes on the same kind of land, although not improved as much, at a valuation of $30 to $35 per acre. All new manufacturing concerns coming into town have all taxes abated for three years, to encourage them, while we are spending all these years improving our land and still paying taxes.

We have been forced to pay for all city improvements such as water, lights, sidewalks, etc., while in other towns similarly situated they have fire lines or borough systems. We have tried to have this matter adjusted, but the village inhabitants have outvoted us. We are facing a situation of paying taxes on about $15,000 while the average village dweller pays taxes on about $2,500 or $3,000 on a tax rate of 13 mills for his home and gets all the benefits referred to. Our taxes this past year have been forced up about $7,000. I should like opinions as to the merits of this case.

New Haven County, Conn. F. Y. Y.

R. N.-Y.—This seems to be a local matter without any uniform system of assessing property. In our own locality in New Jersey our farm, including orchard and wood land, is assessed at $61 per acre. The farms on either side without much fruit carry an assessment of $60. On the same ridge and within half a mile values are $50. The best orchard in town—far back from the railroad—is assessed at $40 or less. Most of this land is held for sale at $250 to $300 per acre. There seems to be no uniformity in taxing improvements in trees or lawns. Nothing except comparative figures can give any data for answering the question. We would like to have statements showing what increase in valuation has been made to real estate as the result of tree planting.

"I HAVE eggs cheap as 30 cents, ma'am, but I wouldn't guarantee 'em." "Well, send me a dozen, please. They'll do to lend the neighbors."—Life.

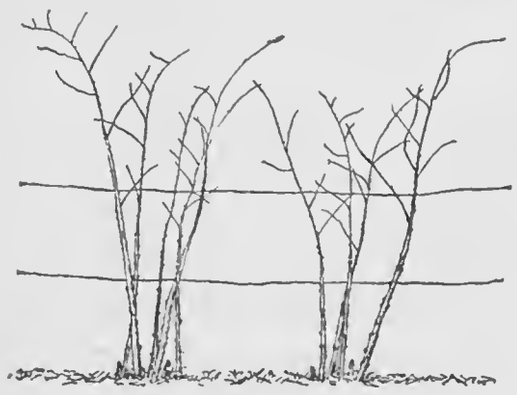
THE NEW BERRY CULTURE.

PART I.

Since my article on "A Year's Bush Fruit Record" appeared in THE R. N.-Y. of October 25, I have received some letters which indicate that some have slightly misunderstood one part of it. I made the statement that, after spending about three weeks on 2¼ acres, removing old canes, thinning and tying the others, the work of caring for the berries was not much more than for other well-cultivated crops. I had in mind the truck crops rather than field crops, and by well-cultivated I mean where the dust mulch is maintained and the crops kept clean throughout the season. I do not wish to be understood that maximum yields may be grown by our system, without a goodly amount of hand work, for, important as I consider this system

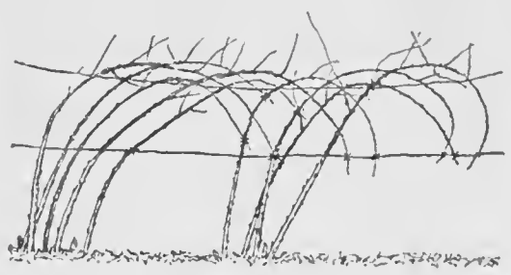


TRAINING THE FIRST YEAR.

of more importance than any system, and we cannot produce the best yields of this or any other crop until we have studied the crop as well as the best methods of growing it.

My attention was first drawn to this system by seeing a wonderful crop of red raspberries in another State, that produced more than 200 bushels per acre. This was on very rich deep soil, and in a climate well suited to the crop. After studying the crop and the system for two years, my conclusion was that more than anything else those immense crops were the result of the plants being able to get all the moisture needed throughout the entire season. I thought then, and do still, after several years' experience in western Pennsylvania that in many of the Eastern States where we have the advantage of good local market, these large yields could be nearly or quite equaled, provided we could handle the moisture problem so that the plants would have all the water needed all season without an excess at any time.

The red raspberries, blackcaps, and blackberries, are handled by the same system, with slight modifications. They may be grown on a wide variety of soils. Good drainage, and ability to hold moisture during the hot Summer months are the important requirements. We found after some losses, that good tile drainage was not suffieient for the red raspberries



CANES BENT OVER IN LATER TRAINING.

on our heavy clay; that after repeated freezing and thawing, the soil became so compact that the water would not sink into the ditches quickly, and that the red raspberries cannot stand a water-logged soil even while in the dormant state. While our drains worked perfectly in Summer we could not hold the berries over Winter without damaged roots, until we ridged the rows slightly and left an open furrow midway between the rows, for surface drainage until we began cultivating again in the Spring. We should avoid frosty locations, and select one sheltered from the worst winds when practical. The plants should be the best to be had from reliable sources.

We have an acre of blackberries now six years old which is a mixture of seven or eight varieties. I would be willing to give one hundred dollars to have them all replaced just as they are, with the variety I bought. We have found that with both red raspberries and blackberries, the green shoots that come up early in the Spring will make as good plants, as any where they can be taken up nearby and set immediately. It is necessary to get a piece of the old root, and, of course these tender green shoots will not stand rough handling, or shipping. When last year's plants are used they will often send out one or more fruit spurs from the old stub. These should be carefully removed, as a handful of berries allowed to mature interferes seriously with the development of the young plant.

All cane berries are set eight by three feet. However rich the soil, we would not set them any closer. In fact our last acre of blackberries were set four feet apart in the row, but it is too soon to report results.

When convenient the rows should be run north and south, as the sun can then shine on both sides. Care should be taken to have the rows as straight as possible, for we expect to cultivate them for several years, and it does not take a very great crook to make narrow places that prevent the use of the spring-tooth harrow, as well as making the use of other tools more difficult. Some low-growing crop is grown between the rows the first year, and on rich soil cabbage or beans may be planted between hills in the berry row. The following Spring a row of seven-foot posts is set in each berry row, about 20 feet apart. Then two wires are fastened to these posts, one three and the other five feet from the ground. We use No. 12 fence wire, and drive all staples tight. The sprawling growth of the first year is then tied up to the wire. We use carpet warp for this work, as it is much stronger than the cotton twine. This is quite a job for the beginner but it can be done early in the Spring, before the rush of other work comes on. Then the cultivator may be run close to the row, reducing the hand work to a minimum. If cultivation is kept up as it should be the second year's growth will be very vigorous, and if these new canes hang out across the row they are tied back to the wire, loosely, never drawing a string tight around a growing cane.

B. V. EGBERT.

Reseeding Cattle Lot.

What can I do with a five-acre grass field which has been used as an exercise yard for 50 cows since September? The turf is badly cut and tramped. Will clover sowed early and harrowed in unite with the remaining grass to make a crop this season?

H. R. W.

New London, Conn.

In our experience we have never been able to get a good catch of clover under such circumstances. That ground must be beaten down hard and cut up. We doubt if you can hope to get a proper seeding without plowing or disking and fitting the soil well. We should prefer to plow and plant corn on such a field, seeding rye or wheat and clover at the last cultivation.

Start Your Garden Early

In response to a special demand I have manufactured a sash frame 8 ft. 4 in. long and just wide enough for a 3 foot space. In place of many small lights there is one large light of extra-heavy glass which allows the maximum of life-giving sunlight to reach seeds and plants. Not heavy and cumbersome. It is so simple a child can ventilate it. If desired the sash can be hinged. Price complete, ready to put together, freight prepaid anywhere in the United States $10.50 (a remarkably low price, made possible only by the large volume of my business).

If you would enjoy home-grown produce in June, start your garden in February. Send your order and check today. Shipments made promptly.

Planting instructions sent with each frame. Write for Catalogue of LUTTON'S GREENHOUSES and standard size sash frames.

THE PRUNING OF APPLE TREES.

PART I.

We have definite information and figures to back it up, when the question of selecting, planting, fertilizing, or marketing arises, but no one can give more than general information as to how to prune, unless he has seen the tree, knows the variety and something of the previous history of the tree. One also needs a pretty good imagination, which will help him see the effect the pruning will have on the future growth of the tree.

What is pruning? Is it a mere forming of the top of the tree into some symmetrical or grotesque shape, or is it a process in the development of the tree in which the grower considers the previous life, present condition as to surroundings, vitality and value, and the effect of the treatment on the future of the tree? One's success depends largely upon his conception of what pruning is. The writer has, in the four years spent at commercial pruning, discovered many curious ideas concerning tree pruning. One man said that he left long stubs on his trees because someone had told him it would take longer for them to rot into the tree. Another with the same idea, in talking about some trees that had just been pruned, said that they were spoiled just as his neighbor had spoiled some.

This neighbor had made all cuts close and decay set in and destroyed the trees. When asked if paint and other means of protection had been applied to the cuts, he said there had not. That is only one of many cases of jobs half or carelessly done, followed by failure and the prejudice of many against modern orchard practice. Another man claims that little or no pruning should be done, but that the trees should "get the bearing habit." That man's trees are a sad sight as far as appearance goes, and though he had a fair crop of fruit this year it was not of high quality.

PEAR TREES HEADED HIGH.

The cut shows one man's idea of the proper height to head pear trees. He said he wanted to get under the limbs with a horse. These trees are about six years old, and are headed over 4½ feet high; this makes a tree that has little chance when a high wind comes and finds it full of fruit. This man will also have a difficult job when he starts picking his fruit. Such trees as these are more apt to be injured by tools and harness than trees headed lower. The picture shows how the trees lean, caused by high winds and no protection. Some trees in this orchard, which have been headed much lower, are not affected by the wind. These trees were cut back so severely during the second and third years that the tops are nearly all one to three-year wood. This man thought that cutting the trees back, leaving little or no wood of the current year's growth, would force the growth into the trunks and make them stronger. He would have had much better results if he had taken one-quarter or one-third of each year's growth off, or better yet, have gone over the trees during the growing season and clipped the tips of the shoots when they had attained the proper length, or about 16 to 18 inches. This would check the lateral growth of the twigs and have a tendency to increase their diameter. The writer has followed this plan and finds that it gives a strong and well-shaped tree, with the minimum expense for pruning.

Most of the pruning in the past has been done in the Winter season, but the growers here in South Jersey are gradually taking up Summer pruning for apples and pears, as they find it tends to check the excessive growth of wood, and induces the development of the fruit buds. If the trees are young and vigorous they should be pruned in Summer, but if they are old or weak, the Winter pruning will start stronger growth, provided the trees are not too weak and too severely pruned. In pruning one must remember that the tree must depend on the leaves to elaborate the crude sap before it is available for forming new wood or fruit, and if too much of the leaf surface is removed from the weak tree there will be a very slow recovery and in some cases the tree will even become weaker. Judicious pruning will, as a rule, induce a strong healthy growth of wood which produces more and better fruit.

Many people have a mistaken idea regarding the real value and reasons for the "heading in" or cutting back of young growth in fruit trees. The case of the pear trees shown in the picture illustrates the effect of heading in too short during the early life of the tree. Some growers go to the other extreme and do not cut back at all. They just thin out intersecting branches and let the trees make all the lateral growth they can. This usually produces a tree with weak slender main limbs, which are not able to hold up the heavy load of wood and fruit they might have held, had they been pruned to a length more in proportion with the diameter.

R. B. GILMAN.

Manure for Fruit Trees.

I set several acres last Spring to apple and peach trees. I was told not to manure the trees when I set them out but wait until this Spring to manure them. I obeyed my instructions, excepting two rows of peach trees, about 40 trees long, which trees were set down a row already manured with horse manure for cantaloupes, (in order to get the rows the same distance apart this was necessary). I find that the trees set in the rows where the manure was, have made four times the growth of the others where there was no manure in the rows. I wish to know what is best to manure these trees with this Spring, and also if it is best to spray these young trees? If so at what time, and what mixture to spray with? E. W. T.

The advice not to manure those trees was good. When the trees are set in a field where the other crop is heavily manured, you will in the end do the trees more harm than good by piling on more manure. While they may make a quick and active growth of wood, this is not an indication of the best tree. This tender wood is far more subject to disease and danger from frost than a shorter growth of hard, solid development. When the tree is forced so hard from the first, fruiting is often delayed, for the tree is started into wood rather than fruit production. We should spray those trees, by all means, with lime-sulphur, but not use manure when planting. It would be far better to use a mixture of three parts fine bone, and one part muriate of potash, about two pounds of the mixture scattered around each young tree, and well worked into the soil.

Maloney Trees

are grown on our own farms, budded on the finest branched root, imported seedlings money can buy. Mr. A. E. Maloney watches over our stock from the time the seedlings arrive until the trees start for your orchard. Every care is taken to deliver

True to Name and Absolutely Healthy Trees

for we propagate from varieties of merit and only sell what trees we grow ourselves, here in this, the most favorable Nursery section of the United States, where the San José Scale is positively unknown. During our 29 years of selling direct from Nursery to planter, we have built a permanent business, equipped to handle our own Nursery stock in such an economical manner that we can offer

Quality Trees at Very Low Prices

We know just what it costs to grow, sell and ship every tree. We are satisfied with a reasonable profit. Our prices are fixed accordingly.

Place Your Order Early

for while we have a big supply, our reasonable prices create a heavy demand, and it will be a case of first come, first served until our stock is exhausted.

What Trees Shall I Plant this Spring?

This 120-page Book Will Help You Decide—Mailed Free

120 Pages—Prices in Plain Figures

Every fruit grower and farmer should have William P. Stark's 1914 Catalog. It lists the best of all tested, profitable fruit trees, berries, roses, shade trees, etc.; tells where each variety does best; its season of ripening; clear, understandable descriptions; everything conveniently arranged so you instantly find what you want; beautifully illustrated; *all prices in plain, bold figures.*

A Catalog Arranged from the Buyer's Standpoint

Buy Direct from Nursery—30% to 50% Saving

By cutting out all agents, plate-book men and middlemen we are able to ship to you direct from our Stark Ozark Nurseries and at wholesale nursery prices. You get just what you order and you make a very pronounced saving. Our big brick packing house and force of experts insure you prompt, careful shipment. Safe delivery guaranteed. All trees and plants *doubly guaranteed* true to name.

Get Prices on Delicious Apple

This, the world's prize apple, originated in Iowa. It is particularly adapted to the cold climate of New York and Eastern States. You can now get genuine Delicious apple trees, grown the William P. Stark way, at prices you usually pay for common stock. Plant heavily of Delicious. You will find it your greatest profit-maker. Recommended by New York Agricultural Experiment Station, Geneva, N. Y.

Last Call for J. H. Hale Peach

You will have to act quick if you want some of these wonderful J. H. Hale Peach trees. Our stock is diminishing every day. Read what visitors to Mr. Hale's orchards said last September: "Largest and most beautiful peach I ever saw." "This puts Elberta out of business for me." "We can't meet this peach with Elbertas and stay in business." "Wonderful peach, shall recommend that our company plant 2,000 acres." "No one will ever plant an Elberta after seeing and tasting this." "More profit in the J. H. Hale than if I got Elberta trees for nothing." Our catalog fully describes this great peach. Send for it today.

All Good Fruits

Winter apples: Delicious, Baldwin, R. I. Greening, McIntosh, York, Stayman, Winesap, Paragon, etc. For Fall: Wealthy, Gravenstein, etc. Summer: Duchess, Yellow Transparent, etc. Splendid 1 and 2 year old trees. The catalog lists every good apple, peach, pear, plum, cherry, quince, grape, gooseberry, raspberry, blackberry, currant, field-grown roses, shrubs, shade trees, etc. The genuine William P. Stark quality, at lowest grower's prices. Write today. (77)

The New Edison Phonograph

Mr. Edison's *Latest* Invention

Now Shipped

FREE

An offer introducing ***The New Edisons.*** Write quick—*while this offer lasts.* Edison's new phonograph—*just out!*—the perfected musical wonder of the age!

WRITE *today* for our *new* Edison catalog—that tells you all about the wonderful *new* model Edison and **our *new* Edison offer!**

Hear the latest up-to-date song hits of the big cities. Laugh until the tears stream down your face and your sides ache from laughing at funniest of funny minstrel shows; hear the grand old church hymns, the majestic choirs, the pealing organs, the splendid operas, the crashing brass bands, the waltzes, the two-steps, the solos, comic vaudeville, duets and quartettes. Take your choice of any kind of entertainment. All will be yours with the Edison in your home.

The Offer:

We will send you the *new* model Edison Phonograph and your choice of all the brand new records on an **absolutely free loan.** We want you to hear all the waltzes, two-steps, vaudevilles, minstrels, grand operas, the old sacred hymns, every kind of comic and popular music, also your choice of the highest-grade concerts and operas, as rendered by the world's greatest artists. Entertain your family and friends. *Then, when you are through with the outfit, you may send it back at our expense.*

REMEMBER, not a penny down—no deposit—no guarantee—no C.O.D. to us—no obligations to buy—*a full free trial* in your own home—*direct* from us—*direct* to you. Returnable at our expense or payable (if you want to keep it) at the rock-bottom price direct from us.

The Reason: We are tremendously proud of this magnificent new instrument. When *you* get it in your town we *know* everybody will say that nothing like it has ever been heard—so we are pretty sure that at least some one, if not you, then somebody else, will want to buy one of these *new style* Edisons, *especially as they are being offered now at the most astounding rock-bottom price and on easy terms* as low as *a few dollars a month.*

Our *New* Edison Catalog Sent *Free*

Your name and address on a postal or in a letter (or just the coupon) is enough. No obligations in asking for the catalog. Get this offer—*while this offer lasts.* Fill out the coupon now—today.

REGULATION OF NURSERY TRADE.

A bill before the New York Legislature is endorsed by the fruit growers and horticultural societies. It is designed to regulate the sale of nursery trees—the vital points being given below:

263. Sale of fruit-bearing trees. Every person, firm or corporation who shall sell any fruit-bearing trees shipped from any point in the State of New York, must have attached to each car, box, bale or package, a copy of a certificate of inspection issued by the State Department of Agriculture, signed by the Commissioner of Agriculture, and valid to the first day of September next following the date of the issuance thereof. There shall be attached to each bundle or package of such fruit-bearing trees a label specifying the name or variety of the trees contained therein. In case such bundle or package shall contain trees of different kinds or varieties, there must be attached to each tree therein a like label.

264. Nothing contained in section two hundred and sixty-three, or in any other section of this act, shall be construed to deprive a purchaser of any fruit-bearing trees of his remedy at law in a civil action to recover damages sustained by reason of such trees proving untrue to name as specified on the label. Such damages may be recovered in a civil action by the purchaser of such fruit-bearing trees, or by his personal representative or assignee, at any time prior to the third bearing year, the purchaser to notify the seller as soon as discovery is made that such trees are not true to name. In any action to recover damages suffered by the purchaser by reason of any fruit tree or trees not being of the name and variety for which they were tagged and sold, the seller shall have the burden of proof in establishing that any contract, or any provision of contract, exempting the seller from liability, or limiting his liability, was fully understood and agreed to by the purchaser. In every case of a sale of fruit-bearing trees, in lots of twenty-five or more, the seller must leave with the purchaser a copy of the contract, upon the face of which shall be plainly printed the foregoing clause of section two hundred and sixty-four, beginning with the words: "In any action to recover damages" and ending with the words: "and agreed to by the purchaser." The seller must also accompany the shipment of said trees by an itemized list of the same; such list shall also give the name of the county and State where the trees covered by it were grown, the age of the trees, and the name and address of the person for whom the trees were grown, if requested by the purchaser at the time of purchase.

Within five days after the receipt by the purchaser of the trees purchased and the list thereof the purchaser shall compare and notify the seller of any discrepancy between the list and the label on said trees.

265. Any person, firm or corporation acting as agent for another in the sale of fruit-bearing trees in this State shall carry with him, at all times when engaged in selling trees, a certificate in writing, signed by his principal and properly acknowledged, showing his authority to act as such agent, and upon request shall exhibit the same to and leave a copy of the contract, bearing on its face the clause above referred to in section two hundred and sixty-four with the purchaser.

§2. This act shall take effect September first, nineteen hundred and fourteen.

AN ACT TO REGULATE THE PACKING, GRADING AND SELLING OF APPLES AND PEARS.

The Legislative Committee of the New York State Fruit Growers' Association respectfully recommends that a law be enacted to take effect September first, nineteen hundred and fourteen which shall provide as follows:

"All apples and pears grown in the State of New York, packed, sold or offered for sale in barrels shall contain 90 per cent. of the fruit equal in all respects to the face of the barrel."

That "Every barrel of apples and pears grown or packed in the State of New York shall have marked plainly on the outside face head of the barrel the name and address of the packer and such name and address shall not be removed or obliterated, except when such barrel of apples or pears is repacked, in which case the name and address of the repacker shall be substituted for that of the original packer."

The said Legislative Committee also respectfully requests that the grades provided for in the Wilson bill be changed to three grades as follows: "From two inches to two and one-half inches," "from two and one-half inches to three inches," and "from three inches up."

"FARM products cost more than they used to." "Yes," replied Mr. Corntossel. "When a farmer is supposed to know the botanical name of what he's raisin' an' the zoological name of the insect that eats it and the chemical name of what will kill the insect, somebody's got to pay."—Washington Star.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

DO YOU NEED PAINT?

LET ME SEND YOU MY PAINT BOOK. It will tell you all you want to know about paint and painting. The best paint is the cheapest paint. I make the best paint. INGERSOLL'S PAINT has been made for 72 years. It is made with scientific accuracy from the BEST MATERIALS, thoroughly combined by machinery—you cannot make GOOD PAINT with a stick by hand-mixing. Other paints are sold by dealers or supply houses. This method requires salary and expenses of traveling salesmen and profits for jobbers and retailers. These extra expenses and numerous profits YOU MUST PAY when you buy their paint.

I Can Save You One-Half Your Paint Bills

One-half the price you pay the retailer represents the factory cost of the paint. The other half is required for middlemen's profits and expenses. Our paint is shipped fresh from the factory direct to you. You pay simply the factory price. You pay no salesman; no hotel bills; and no middlemen of any kind. The dealer or supply house may offer you a paint at our price; but THEY CANNOT GIVE YOU OUR QUALITY OF PAINT AT OUR PRICE. They must add the cost of their expensive method of selling and middlemen's profits; IF they give you the Ingersoll QUALITY of paint the cost will be DOUBLE OUR PRICE.

Don't Use Cheap Paint

offered by dealers and supply houses. They may save you a little on first cost, but no more labor is required to paint your buildings with INGERSOLL PAINT than with inferior store paint. Poor paint always makes a building look shabby in six months or a year, and is sure to make you regret the little saving in the first cost of the material. INGERSOLL PAINTS will give you long years of satisfactory service and LOOK WELL ALL THE TIME.

Ingersoll Mixed Paints

have held the official endorsement of the Grange for 40 years

We can refer you to pleased customers in your own neighborhood.

We make it easy for you to buy paint direct from the mill. The book will tell you the quantity needed. The order will reach us over night, and the paint will be on the way to you in twenty-four hours. Let me send you my FREE DELIVERY PLAN. Send your address for a beautiful set of Sample Color Cards and our Paint Book. We mail them FREE.

THE TRACTOR ON A FRUIT FARM.

Three years ago we lost two horses by overfeeding and the other through sickness within six days after purchase from a horse dealer who had worked off a sickening horse on us. His guarantee was worthless. These experiences, together with the difficulty of obtaining reliable teamsters, made me look more fully into the tractor. I determined that if it were possible to get something to relieve the teams of the hardest work in the Summer it would mean a lot of saving in horseflesh.

After considerable correspondence a manufacturing firm agreed to put one of their machines at work on 30 days' trial, provided we would pay the freight. It is a one-man plowing outfit, and we tried it at plowing first. There were so many defects in that particular machine that it was always in trouble of some kind, and even at that it did about as much work as four horses and two men would have done. The 30 days' trial went into six months, with considerable loss of patience. The makers were always fair. After doing all they could for us on the old machine they sent us a new one with many improvements on it, which overcame a large proportion of our previous troubles. They sent an experienced man to start it and stay with us until the machine was satisfactory.

The plowing was not perfect, as the bottoms were fashioned for the West, and are not the best for us. However it did better work than four-fifths of our teamsters do, and it will plow any depth you desire. It is kept so busy doing other work that it is seldom used for plowing. We find it very valuable as a tractor pulling machines that four horses could not start and eight horses could not work steadily in hot weather. For level cultivation in orchards and preparation of seed beds for grain and grass we use an eight-foot double-cutaway engine disk harrow with 20-inch disk. It pulls this as fast as my driving horse will walk for eight hours per day, week after week in the hottest weather.

The time spent on repairing will not amount to any more than horseshoeing would have totalled for equal amount of work. The upkeep will not exceed the feed bill of the extra horses, and pay for the extra men to work and care for the horses would more than pay for the running expenses of the tractor. It costs us about $3.25 per 10-hour day for oil, grease and gasoline. This particular machine has very high wheels, which makes it less desirable for orchard work than a low-wheel tractor, but it has so many uses on our farm that really we would not know how to get along without it now. We do a lot of deep work with a deep tiller, we found this a horse-killer, but for our tractor it is child's play to plow 12 inches wide and 16 inches deep. During the past Fall in digging fruit trees in the nursery we were able to dig several inches deeper by using the tractor than we could have possibly done with horses. We had less damaged trees and did the work in about one-third the time usually required for this work.

I can readily understand why the tractor has been condemned, as has been every new farm machine yet introduced. It takes time, patience and some mechanical knowledge to find the best use for these innovations, and to condemn without trial is a very common practice. We have seen many machines, and never saw a perfect one yet, but our tractor gives us no more trouble for service rendered than does our binder or mower. Is it true that, to the average farmer and fruit grower, these troubles seem more difficult to overcome, yet after two years' experience we find them no more annoying. In conclusion, let me advise the man who has neither patience nor mechanical ability to leave the tractor out of his equipment.

New Jersey. WALTER C. BLACK.

PREPARING FOR STRAWBERRIES.

I have a field now in rye that I wish to set to strawberries one year from this Spring. This field was in a sparse clover sod in the Spring of 1911. The sod was plowed under and buckwheat sown and plowed under, followed by rye. The rye was manured the next Spring and the field set to strawberries. By the Fall of 1912, the white grubs had practically taken the whole field. The field was picked and plowed up, and sowed to buckwheat, followed by rye. We expect to manure the rye and plant corn next Spring, manure again in the Fall, and use about 500 pounds of 2-8-10 fertilizer in the Spring. The land is a gravel loam, that "throws" lots of sorrel and gives other evidence of being pretty sour. Do you think I can depend on the cultivation of the corn to get rid of the grubs? Would I better plow in the Fall at the proper time as a further safeguard against the grubs? H. T.

Michigan.

But for the grubs, this plan properly carried out would seem to be first-rate preparation for a strawberry crop. From choice we should keep the manure off the rye, and not use manure at all before the strawberries. We should plow under the rye as you suggest, and use more fertilizer if need be, rather than put on the manure. You cannot entirely depend on killing out the last of the white grubs this year, but with the most thorough cultivation possible there will be few of them left. They may still cause some trouble, as their life history shows that they carry over a number of years, but the work you suggest doing is probably the best plan that you can take up for killing out the grubs. At the last cultivation of corn we should sow buckwheat and Cow-horn turnips, in order to add as much humus as possible to the soil. Then late in the Fall we should plow these crops under, leaving the furrows rough through the Winter. Fall plowing does help to clean out the grubs, and if it is possible to have a flock of poultry, or a drove of active young pigs follow the plow, these helpers will get many a grub that would otherwise be left over. The plan is a good one, but for its full success the most thorough cultivation should be given up to the time of seeding the cover crop.

TRACTOR AT WORK IN ORCHARD.

A SPECIAL FERTILIZER FOR EVERY CROP

ANY particular type of soil requires entirely different proportions of the plant food elements for producing maximum yields of different crops. The kind of fertilizer to apply to your various fields depends on three things—the kind of soil, the amount of plant food it already contains, and the kind of crops you intend to grow on each field.

Consumers Brands for General Farm Use are made-to-order to meet the individual requirements of the different soil types on your farm and the crops you are to grow. They comprise special distinct compositions of plant food elements for forage crops, for cereals, for root crops and for fruits. No expensive elements not needed in your soil for any particular crop are wasted. This means economy in buying fertilizer and efficiency in applying. Consumers Brands are sold only direct to the user. This means another saving and also that you get just what your individual soil requires.

Early-Crop Odorless Fertilizer is prepared especially for the MARKET GARDEN TRADE for vegetables, small fruits, greenhouse and garden crops. It supplies the four plant food elements needed for these crops in soluble form, mixed in such proportions as to meet your particular soil and crop requirements. Although soluble, it is so prepared in granular form as to prevent leaching and wasting. It produces quick growth and early maturity, which means bigger profits.

Whether you are a commercial farmer, a country estate or suburban home owner, or merely "doing your farming" in a city yard, you should send for our free circular giving valuable suggestions for the use of Early Crop Odorless Fertilizer.

Holden's Special Fertilizers for Florists and Gardeners for Greenhouse Work

These fertilizers are prepared by men who have made a life study of greenhouse fertilization in such a manner as to furnish just the plant food elements which your compost lacks. For this reason you save the cost of such plant food elements as your particular soil or crop may not require.

Consumers Brands Special Fruit Tree Fertilizers

Apples, peaches, pears, plums, grapes, etc., require careful and intelligent fertilization. We prepare special fertilizers with all the necessary plant food elements mixed in the right proportion to meet the needs of your fruit trees and according to the requirements of the soil in your individual orchards. Send us your specifications for efficient fertilizers.

Agricultural Chemical and Fertilizer Materials

We are also prepared to furnish all high-grade agricultural chemicals and fertilizer materials in any quantity. We make a specialty of GENUINE THOMAS PHOSPHATE POWDER (BASIC SLAG).

We sell only direct to the consumer.

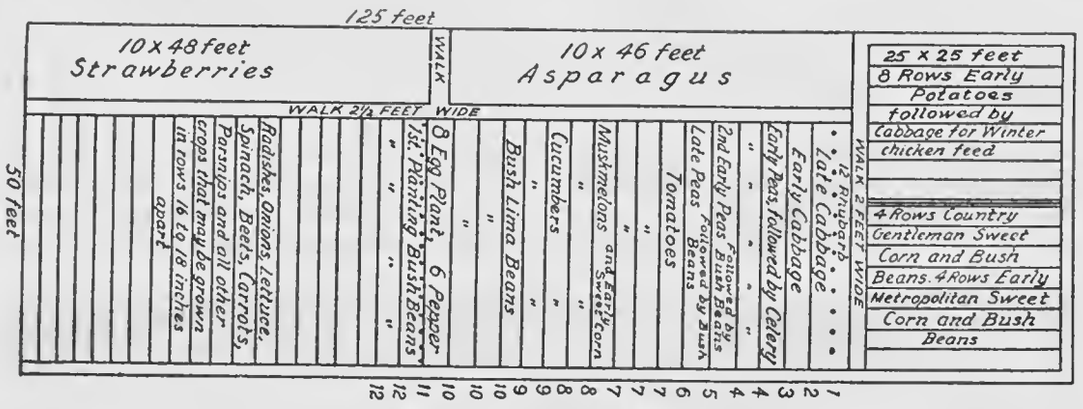
HOME VEGETABLE GARDEN.

I wish to grow vegetables on piece of ground 50x125 feet, in grass a good many years, producing a fair crop of Timothy and some clover. How about manuring? I have a sugar barrel full of almost pure poultry droppings packed in hard and covered from the weather. How can I use it to best advantage? I could secure a load or two of stable manure. Will it be necessary? How can I work into shape to the best advantage and lay out this plot? I wish to grow corn, potatoes and the ordinary garden vegetables, and if possible raise some Winter feed for a few chickens. W. M. W.

This piece of ground contains nearly one-seventh of an acre, and should have an application of five tons of well-rotted stable manure at least, spread broadcast and plowed in, and 300 pounds of air-slaked lime, spread evenly after plowing and harrowed in. Plow eight to 10 inches deep. It is seldom that good garden crops can be raised on ordinary farm land the first season, especially fresh sod land. Usually two to three years of heavy manuring and good tillage is required to bring the average farm land up to the high state of fertility and tilth required for the production of maximum crops of first-class vegetables. Fresh sod land, as a rule, is very difficult to cultivate to small vegetables, and unless patience and diligence are a pretty large asset of the man undertaking the job, the enterprise is likely to prove disconragingly disappointing. Such land would be much better cropped to corn the first year. With good cultivation the grass and weeds wonld be pretty well subdued and the land be in a very much better condition of fertility and tilth for the growing of vegetables by the second year.



VEGETABLE GARDEN PLAN.

The hen manure may be used as a top-dressing on the ground where the small vegetables are grown; also sparingly in the hills of sweet corn, in both cases to be well mixed with soil. The diagram shows a very good plan for the laying out of a home vegetable garden, on a piece of gronnd this shape and size, whether for temporary or permanent use. If for temporary use, then of course the rhubarb, asparagus and strawberries are to be omitted, and the ground cropped to an annual. The spaces allotted to asparagus and strawberries can be planted to sweet corn, sweet potatoes, melons, or anything most desired. If strawberries are planted, the space allotted to them should not be limed. The plot allotted to radishes, onions, etc., should not be all planted at once; part of the space should be reserved for a succession of such crops as grow rapidly, and of which two or more crops can be grown during the season.

The potatoes and corn rows are intended to be a fraction over three feet apart; cabbage and pea rows three feet apart; tomato, cucumber and muskmelon rows four feet apart; bush, lima, green and wax bean rows 30 inches apart; all the small vegetables, such as onions, radishes, lettuce, etc., rows 16 to 18 inches apart. The melons and cucumbers are to be planted in hills four feet apart, with a hill of early Metropolitan sweet corn planted between the hills in the row same day as the melons and cncumber seed is planted. This should be for the first crop of corn. Plant the plot allotted to sweet corn abont two weeks later, four rows to Early Metropolitan and four rows to Country Gentlemen; both sorts may be planted the same day. Between the hills of corn, plant green and wax-podded bush beans. If early potatoes are planted, the crop can be cleared off in time to plant to cabbage, of some large-headed early sort, for Winter chicken feed.

It should be the aim all through the season to have the ground occupied with growing and matured crops. As quick as one kind is cleared off, get the ground ready and sow or plant to some other kind. It is keeping the ground constantly occupied with crops in some stage of growth that makes gardening profitable. The plan submitted is only intended as a guide to the laying out of the garden, which may be improved upon under certain conditions, and such changes as to the kinds of vegetables grown, and the quantities of each, will have to be regnlated to suit the requirements of the consumer. If more vegetables can be produced on the ground than are required, a few currant and gooseberry bushes, also a few grapevines, may be planted where they will least interfere with the cultivated portions. The wheel hoe and small hand tools are the implements to be used in the cultivation of a garden of this size as there is too limited an area to admit of horse cultivation. K.

Dynamite for Planting Trees.

We are intending to set out 1,000 trees, both peach and apple, next Spring, and were thinking of blowing holes with dynamite. We understand that some professor of Geneva Experiment Station, stated at the Connecticut Pomological meeting this week that they had tried it and could not recommend it on account of trees settling six to eight inches the second year. Do you know if this is right? R. B. O.

Cheshire, Conn.

In reply to an inqniry at a meeting of the Connecticut Pomological Society in regard to the valne of dynamite in preparing holes for trees, the following is the snbstance of the answer given:

Under certain conditions it appears that dynamite may be used to advantage in preparing ground for trees. On strong, rocky land where it is difficult properly to dig holes the work may be done more qnickly, more cheaply and more thoroughly than with spade or shovel. Thin subsoils impervious to water, underlaid by soil of a more porous natnre, may be shattered to such an extent as to permit of more thorough drainage and thns greatly improve conditions. More evidence must be available, however, before the use of dynamite may be recommended for ordinary soils in which holes may be readily opened with the spade. It is true that trees set after the use of dynamite on snch soils will often make a splendid growth, and it is also true that they may make an equally good growth without its use.

Statements have been made by some fruit growers using dynamite that under certain soil conditions the trees may settle three or more inches during the first Summer, and the writer has seen long rows of trees leaning at a decided angle from heavy west winds, conditions brought about by the looseness of the soil due to the use of dynamite. The adjoining rows, set in the ordinary way, showed no tendency to lean from the perpendicular. Two years ago a line of work was started at the Experiment Station, Geneva, N. Y., comparing the use of dynamite with subsoil, and the ordinary plowing methods. It is too early to begin to draw any conclusions, but it may be of interest to note that after two seasons' growth no advantage could be detected in any way in the caliper of the tree trunks, in the length of annual growth of branches or in the Summer foliage from the use of the dynamite. Differences may, however, develop later. It would appear then, that dynamite may be used to great advantage under some conditions and that under other conditions it might be used in an experimental way until its value has been fully determined. O. M. TAYLOR.

ENGLISH GUIDE (showing places of interest): "It was in this very room, sir, that Wellington received his first commission." American Tourist: "Indeed! And how much commission did he get?" —Boston Transcript.

A MISSOURI SUNFLOWER CROP.

A year ago the writer made inquiry through the columns of the THE R. N.-Y. for information regarding the culture of the sunflower as a commercial crop. Very little information was available, so we put in a crop as an experiment, with the result that for a money crop they are far better than corn (or at least they proved so this season with us). The securing of good seed we found to be the most important and most difficult thing in the making of a profitable crop. We bought our seed from a prominent western seedsman for the Giant Russian. This is a large single-headed type with large striped light-colored seed. Often individual heads grow 15 inches in diameter. The seed we planted was grown, evidently, in close proximity to some other sort as probably one-fourth of the seed was of the old-fashioned variety which produces from five to 20 small heads to a stalk. This greatly reduced our yield. We prepared our ground the same as for corn and planted May 2, using the two-row corn-planter and drilling them three feet eight inches by 15 inches. In the future we shall plant them three feet six inches by 18 inches, as 15 inches is too close. Perhaps 20 inches would be even better. A mistake we made this season was not running our seed through a corn grader to even them up so the planter would do a better job. The seeds as they came to us were of all sizes. Sometimes there would be two or three drop in a hill, and then the large seed would cause the planter to miss two or three hills.

During a wet season we replanted the missing hills with plants taken where they were too thick, but this does not pay as they do not start off soon enough after transplanting and the weeds get the best of them. Another year we shall grade our seed so they will drop evenly and will use an edge drop planter. The cultivation given was the same as for corn, three plowings with two-horse cultivator.

Our method of harvesting was a bit more expensive than the method employed by farmers some 15 miles south of us where the sunflower is coming to be a leading money crop. With them the heads are cut off as soon as ripe and hauled in and put in large cribs to thoroughly dry before thrashing, which is done in a common pea-huller run at a slower speed with part of the concaves removed. These growers often follow their wheat crop with sunflowers, planting as late as the first of July, and realize $20 to $30 to the acre. Harvesting was not as expensive as we thought it would be. We drove along the rows with a two-horse wagon with 40 bushel bed. One man walked and with a sharp pruning knife cut off the heads with a few inches of stem attached. He took three rows at a time, throwing the heads into the wagon and with two men beating the seeds out against the sides of the wagon, they harvested an acre in half a day. By running through a seed cleaner all the broken heads, light seeds and trash were winnowed out. We found that the seeds beat out of the heads more readily in the morning or on damp days. From the 11 acres we harvested over 4½ tons and, had it not been for the poor stand, (owing to uneven and spurious seed and a severe drought) we believe that we would have had six tons at least.

From conversation with a grower south of us we learn that the past season some men have sold their crop at figures right around $50 per acre. We leave it to the readers if it is a profitable crop, as the following are our figures taken from our books:

To breaking 11 acres at $1 per acre	$11.00
To preparing 11 acres at 50c per acre	5.50
To 50 lbs. seed at 8c lb.	4.00
To planting—team and man $2.50 per day	1.87
To 3 cultivations 1¼ day each at $2.50 per day	9.37
To harvesting (3 men, 1 team) 7½ days at $5 per day	37.50
To cleaning seed, 3 men 2 days at $3.75 per day	7.50
	$76.74
By 9300 lbs. seed at $3.75 per cwt.	$348.75
Expense	76.74
Profit on 11 acres	$272.01

The St. Louis market quotations early this year were $4 per 100 pounds, but we sold to our local dealer at $3.75 per 100 pounds. Market prices on sunflower seed fluctuate considerably; this season prices ranged from $5 to $2.50. We had no trouble with our seed spoiling, as it was left in the field until pretty well cured in the head. W. K. M.

Sikeston, Mo.

WEATHER AND CROPS.

February is giving us the Winter weather of the season. I have become local weather observer for the Weather Bureau, which adds another reason for being weather-wise. Stock is wintering well and feed seems in good supply. A coöperative creamery has just started here with strong competition. W. E. D.

Hillsboro, O.

We have just come through another cold snap; registering thermometer showed 11 deg. below zero at one time last night, 7 deg. below last week, with high wind. Nothing has thawed out since, so we cannot tell what may have happened to our peach buds. My opinion is that not a great deal of harm has been done. The great damage was done by the January freeze. C. E. L.

Middleford, Conn.

We have had up to this date a very mild open Winter, the coldest weather up to date being 12 degrees above zero. A great deal of plowing was done during the early part of Winter for this year's corn crop. We have had several rainfalls during the last three weeks. Wheat is looking fine, with prospects of a better crop than usually. The past season was very dry here, and made crops short, but the mild warm Winter is making them feed further. Hay $10 a ton; corn 85 cents; wheat $1; oats 70; potatoes $1. Clay peas $2.50 per bushel; peanuts $1.60. Good cows $50 to $75; good mares $150 to $225; horses $75 to $150; stock hogs $6 to $7 per 100 pounds. Hens 10 cents pound; eggs 20; butter 20. Real estate is not selling much now, but high when a sale is made. W. H.

Washburn, Tenn.

Here in West Central Pennsylvania we are on the roof of the Alleghanies. The latitude is that of New York City, but we are from 1,400 to 2,000 feet above sea level. On one side our county drains into the Gulf of Mexico, on the other into Chesapeake Bay. The soil is generally fertile, but not so deep, nor the season so long as in the grain growing sections. It is, however, quite well adapted to horticulture. Wild fruits and berries spring up quickly in the slashings or neglected fields and pastures. All the hardy vegetables and fruits grow well under good care and cultivation. Even peaches and Japan plums bear delicious fruit, but must be planted on the hilltops, and then do not always escape frost damage to buds or bloom. Thousands of dollars worth of farm products, especially horticultural products, are shipped into our towns from other sections 200 to 500 or more miles away. Aside from tropical fruits and early fruits and vegetables from the South, these can all be raised here, with the market at our very doors. But our old-time farmer raised grain to feed his horses while he worked at timbering all Winter and as much of the Summer as possible. As the old fields failed to bring crops, new ones were cleared. Finally it became necessary to farm all of them to make a living. So the large farm became the rule, which is generally adhered to even now, though efforts are made for better farming. This has led to isolation, bad roads, poor schools, lack of social centers; to discouragement reflected in the desire of the more intelligent young people to leave the farm often aided and abetted by their parents, who are forced to recognize the better financial opportunities in other callings to be secured by educating their children in the towns. Mining, manufacturing, and railroad towns, such as we have, call for labor, and at a wage that the farmer cannot afford.

Thus, to my mind, our future success here lies in the smaller farm whose labor can mostly be performed by the owner and his family, and whose market products will be fruits and vegetables and poultry. These can be supplemented by some grain and hay to feed the necessary animals. Such a rearrangement of farm practice would put us closer together and the increase in value of property and in numbers of workers to the square mile would mean increased ability to support better schools and to improve the fewer miles of roads needed. I have learned that it pays to sell directly to the consumer whenever possible. But to be successful in so doing it is necessary always to have something to sell that is wanted; to be prompt, regular, courteous and honest in marketing. We raise the earliest fruits and vegetables that are hardy and otherwise adapted to soil and climate to be followed in succession to the end of the season by others that experience has taught me are readily salable. This we aim to do by every economy of time, and labor possible, in order to enlarge that 35-cent dollar without such hard and continuous exertion as to make life not worth the living. T. L. W.

Clearfield, Pa.

The High Cost of Leather Has Made Bootees Popular

There is more leather needed today than ever before. The makers of automobiles are worried about the decrease in the supply. They are paying fancy prices, and are taking the large share of the leather supply. That's why leather shoe manufacturers have been steadily raising the price of their products, and why men who work hard for their money are wearing comfortable **Hub-Mark Bootees.** Every pair represents a decided saving because they last longer and giver better service. They keep the feet warm, dry, and comfortable.

Hub-Mark Bootees are made from pure Gum Rubber and A1 Duck, with leather insoles. They are reinforced at every point where the wear and the strain comes. They have no seams that can rip. Their soles and uppers cannot split nor crack.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

LITTLE THINGS ABOUT SPRAYING.

Busy times will soon be at hand for the fruit men. Spraying will be at hand before we are aware of it. The time for doing the work properly is not long. If it is done, and it must it must be of we have that beautiful, delicious fruit for which we all crave, we must be prepared to push the work along when the time comes, and not be compelled to hasten it along by slighting the work. Slack spraying is time and money thrown away. Too late is as bad as being lax in applying, for if the larva of the Codling moth makes its entrance into the apple, or the fungus has pushed itself in the tissue of the plant, all the spraying in creation is of no avail. We must use all the time we have at our disposal now to prepare the outfit for the work. The pump may have been improperly cleaned when put away. Get it out and take it down. Look over all parts. Examine for a weakness that may cause a break, just as we are nicely at work and thus cause a day or two of delay. Look over the hose and spray rods. New hose may be necessary; we cannot afford to have a break when we suffer delay. Extra couplings and hose-menders should be secured and placed in the tool box to be taken to the orchard with the outfit when we begin. Has the pump shut-offs where hose and pump unite? Much time and annoyance will be saved by putting them there if you do not have them. Our pump did not have them when purchased, but on a rainy day they were put on.

A PENNSYLVANIA SPRAYING JOB.

By the way, is the pump of sufficient size to supply two lines of hose working all the time? Better have it large enough for three, than not large enough for two. We cannot at this time afford to use time of outfit for one-man spraying, would much rather have three if the surface of the ground is such that a tower can be used, so that one man may mount the tower and spray from the top of the tree while the other two from the ground spray the under limbs and sides.

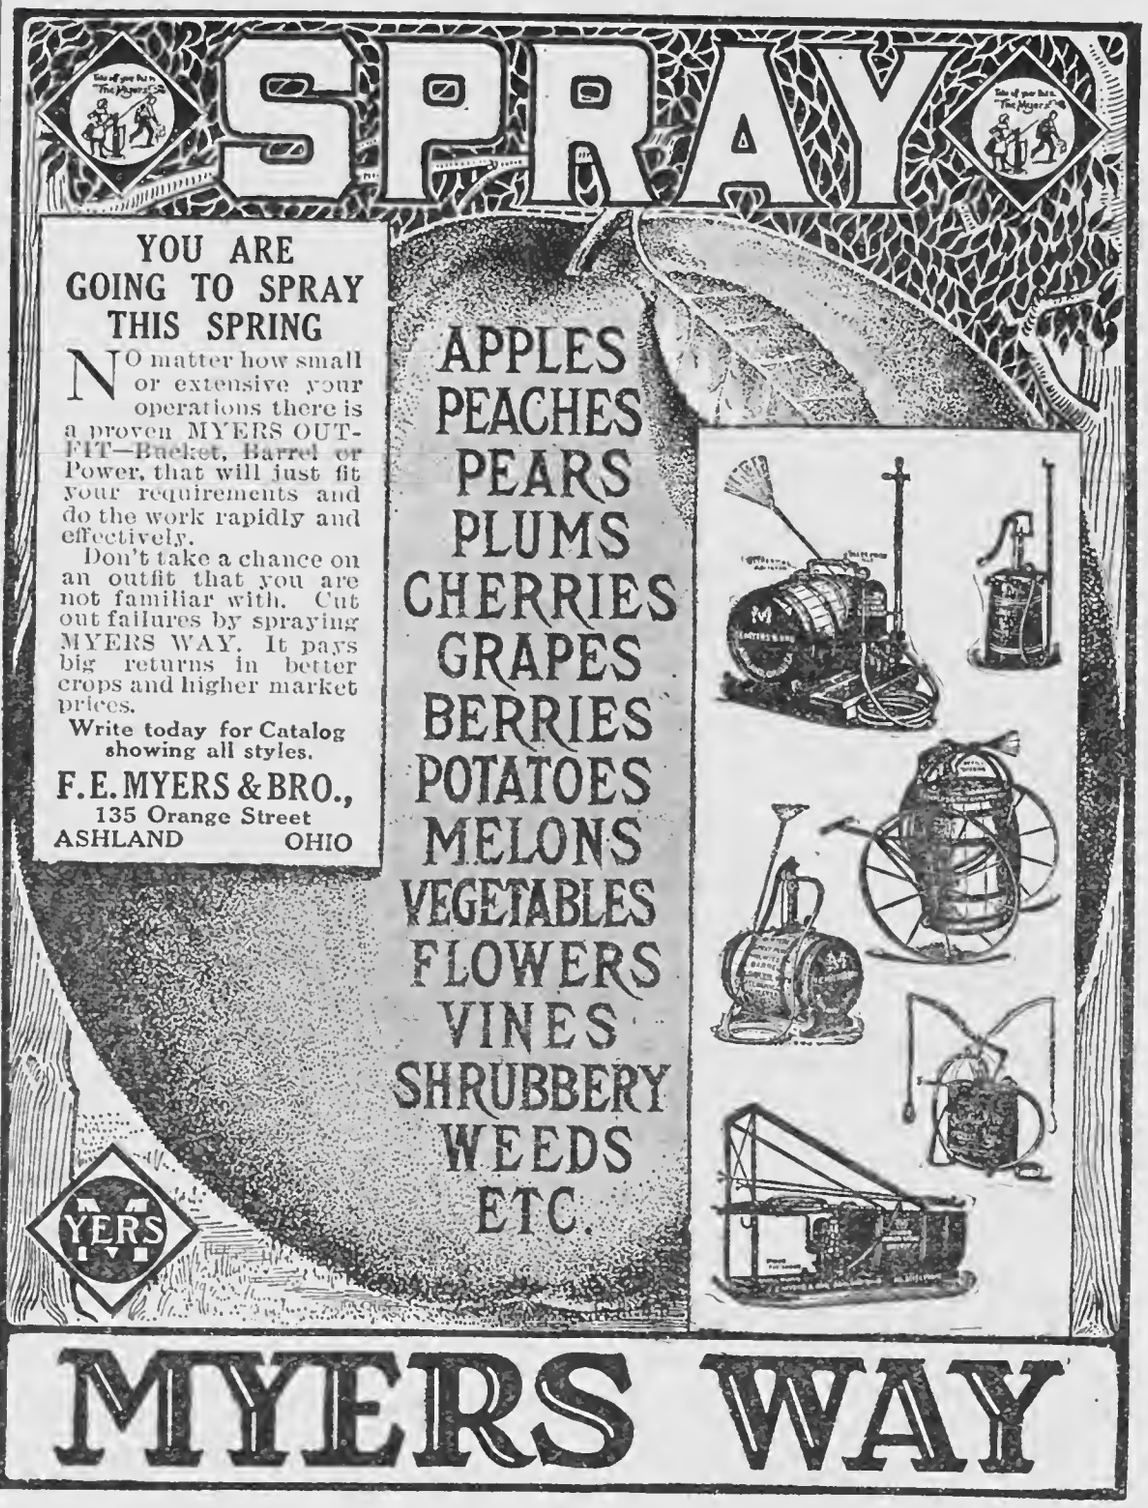
If the orchard is far from the house or water supply, the tank or carrying outfit should be large enough to take at least 200 or 250 gallons of material afield at one time. Going back and forth so frequently costs too much time. The few extra dollars invested in the larger tank will soon be repaid when we count the cost of labor lost in waiting for the refilling of the small tanks.

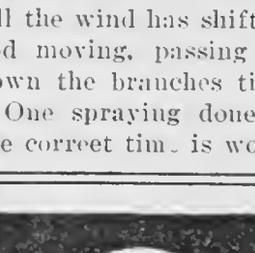
Equip the spray-rod with nozzles that spread the spray well, so as to cover the trees rapidly and well. The time for using nozzles of small capacity, or nozzles that are constantly catching in every little branch, has gone by. The angle nozzles seem to do the best work in all condtiions and under varying positions of spraying.

Gain time in every way possible save by slighting the work. Here we must be careful. There are many failures in spraying, and it is wonderful that there are not more, when we see some people spray. No work on the farm should be done more systematically than that of spraying. We cannot afford to guess where we have worked on a tree. Here is where we need the very best of help. Help with energy enough that they will not be slow in the free use of feet, hands and eyes. Standing in close proximity to a tree and pointing a spray rod at the tree, as the pump throws the liquid through the hose is not spraying. It is wasting. To do a thorough job of spraying, one should begin on some particular branch of some one side of the tree, and cover it thoroughly, branch after branch, twig after twig, till every inch of the tree has been thoroughly covered. Let us remember that none of these enemies we are seeking to destroy, are wandering around as if pleasure seeking, to get hold of our death trap. They have a purpose to perform. That purpose is the reproduction of their kind, through their natural agency. This natural agency they are there to leave. If we do not do the work carefully and fill each blossom end, cover every leaf or branch completely, we have left a place of escape and we may expect the continuation of the species.

Spraying against the wind is wasteful. We cannot throw these fine sprays to any certain spot desired against hard winds. Spraying in the rain is in the same category. Spray on the side with the wind and then wait for the other side till the wind has shifted. Keep the spray rod moving, passing the nozzle up and down the branches till all is covered.

One spraying done thoroughly and at the correct time is worth more than three





Get My BIG FREE BOOK "WHY, HOW AND WHEN TO SPRAY" It Points The Way To BETTER CROPS-BIGGER PROFITS

HURST

EVERY farmer, fruit-grower and truck-gardener needs this book. It is not merely a catalog. Over 30 pages are given entirely to description and photographic illustrations of insects and plant diseases that rob you every year of a large share of your profits. It gives you in condensed form and in simple language all the information and instructions you need to combat these pests; enumerates the various remedies which experiment has proven successful and gives detailed directions as to how and when to apply them. I know that if you will send for this book and follow its instructions carefully you will make more than enough EXTRA PROFIT from your acres or your orchard this year to more than pay for the cost of the outfit and the slight labor involved in using it.

This book also contains illustrations, some in colors, of our 28 different styles and sizes of sprayers from small hand-power outfits to large gasoline engine sprayers for field and orchard. It explains in detail our liberal selling policy under which you can buy

Hurst Sprayers on 10 Days Trial with 5 Yr. Guarantee

I will ship you any HURST SPRAYER, without one cent in advance, without any bank deposit, and without any agreement to keep and pay for it unless you are thoroughly satisfied. SULPHUR
FOR SPRAYING PURPOSES

The Best Sulphur for Lime Sulphur Solution. Combines easily and quickly with Lime.

T. & S. C. WHITE CO., BERGENPORT SULPHUR WORKS
100 William Street, - - - NEW YORK

or four sprayings done otherwise. In saying thoroughly we should include the use of mixtures sufficiently strong to do the work for which they are intended, under the most adverse circumstances. If some mannfacturing company tell us their brand of lime-snlphur will do the work rdeuced one to 10 we may not go amiss at one to eight. It is not necessary to reduce dormant sprays to the very last limit of efficiency under the most favorable conditions.

If a rainstorm arises before the spray has had time to become thoroughly fixed to the tree or plant, then we must of necessity repeat or in the application of the fungicides the application must be f sufficient frequency to keep the new expanding leaf covered with the material. By careful watchfulness, good judgment, and thoroughness of work, practically all our enemies to sucessful fruit production can be controlled. A. T. S.

Spraying for Profits.

My experience in spraying cucumbers, melons and all truck crops dates back some three or four years. I purchased a knapsack sprayer made of copper, and consider it one of the most profitable investments I ever made. Bugs and blight cannot stand arsenate of lead and Bordeaux mixture at the rate of 5-5-50, and they seek business elsewhere. Begin just as soon as the plants come up, for an ounce of prevention is better than a pound of cure. Spray often every week or 10 days, depending on the weather; if rainy and wet oftener because the plants grow fast, and to stamp out the blight and bugs you want to be there first.

Cucumbers properly sprayed will bear from one week to 10 days longer than those not sprayed, to say nothing of the quality of the crop. The illustration on page 338 shows a vine sprayed for the last time and this patch netted the owner at the rate of $100 per acre, besides it being an off year on account of rain.

Washington, Ind. A. M.

Preparing for Strawberries.

I have a half-acre, old strawberry patch plowed under with all the mulch and manure in 1912; planted to cabbage and sweet corn and sown to rye for Winter covering, in 1913; plowed rye in and coat of manure, then planted to melons and potatoes and other truck. Sowed to rye again. Wish to plant this patch to strawberries this coming Spring. What commercial fertilizer would you recommend for best results? The ground is a sandy loam and full of humus. D. W. P.

Howard, Ohio.

This is a good preparation for a strawberry crop. We should plow the rye under in the Spring and be sure to roll or drag the ground down solid and firm. Unless you do this and firm the soil the air will work into the rye and dry out the ground badly. Pack it hard and then work up the upper surface into a fine bed. For fertilizer a good combination would be three parts by weight of fine ground bone and one part by weight of muriate of potash. We would use 500 pounds of this mixture to the acre, scatter it in a strip about two feet wide where the rows of berries are to be planted. Work it in with a cultivator, then set the plant and give thorough cultivation.

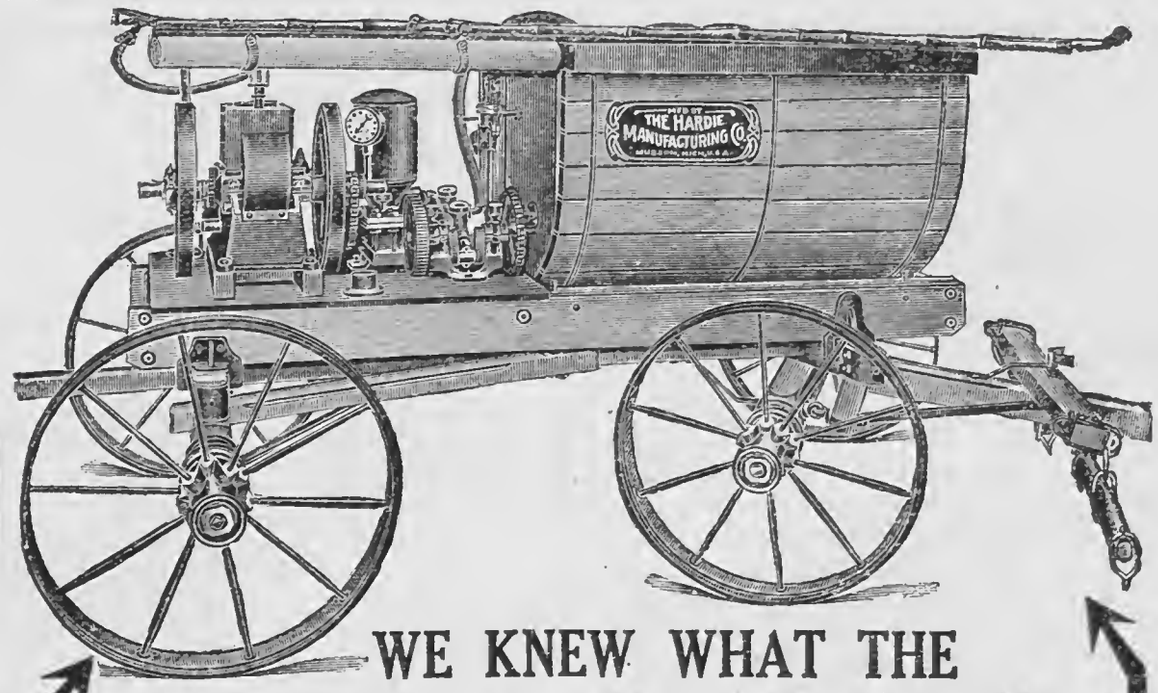
Killing Insects With Electric Current.

Do you think an electric machine could be attached to a weeder or some similar tool, and discharge a strong enough current at the ground end of the teeth to kill chinch bugs and other insects?

Stuart, Okla. T. F.

We think it very doubtful if an electric machine of reasonable cost would have any particular effect in destroying the insects in the soil as you describe. Such a machine might be devised to pull the weeder across the field, but it is very doubtful if the current distributed in this way would have any particular effect upon the insects. For some years past there have been stories in the papers of a scheme for distributing electrified water for irrigation. It was claimed that this water had power to destroy many insects, but we have never been able to verify the statement, and entomologists have little faith in any such method.

"You use different horns for different dances, I suppose?" asked the sweet young thing. "Oh, yes," replied the musician. "What horn do you think best for a quickstep?" "Oh, the auto-horn, by all means."—Yonkers Statesman.



WE KNEW WHAT THE SPRAYING WORLD WANTED

A small, light-weight, efficient power sprayer, of high pressure, adapted to all kinds of spraying and at one-half the usual price. These requirements we have met, and are pleased to present them in

THE HARDIE JUNIOR

IT MEETS THE GENERAL DEMAND

It is the last word in a power sprayer. It is more than up-to-date, it is far ahead of the times. It is pronounced the Twentieth Century's Greatest Sprayer.

The name of Hardie stands for sprayer efficiency from coast to coast. The Hardie machines are noted among more than 6,000 users for their High Pressure, Large Capacity, Simplicity of Construction, Accessibility of All Parts and Freedom From Experimental Risks.

The introduction of the Hardie Junior makes it possible for every farmer to own a high-pressure sprayer. It's "The Biggest Little Sprayer Ever Made." Never before has there been offered so much at such a small price.

Price, $140.00 COMPLETELY EQUIPPED TRUCK $25.00 EXTRA

Freight Prepaid to any Point East of the Mississippi River

Only the very best materials are used; it is of high-class construction and mechanically perfect in every detail. Read the specifications and convince yourself that this is the most advantageous and economical sprayer offer you ever saw.

SPECIFICATIONS

150-gallon all-cypress tank, 1½-inch cypress, 1½ horse-power, 4 cycle water-cooled engine, rotary agitator running in bronze bearings, pump with capacity of 4 gallons per minute, with cut gears and bell metal ball valves. Machine fully cabbed with curtains, both sides. 25 feet of high-pressure hose, our famous Hilo Spray Rod, large tank stralner and a full kit of tools. Shipping weight 550 lbs.

You want a sprayer that will meet all conditions, give you the greatest satisfaction, and one that sells at a money-saving price. This is what we offer in the 1914 Sensation, the Hardie Junior. Let us tell you more about it. Sit down and write for a catalogue.

We also manufacture all sizes and styles of hand and power sprayers.

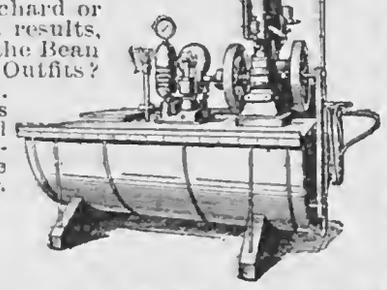
Western Factory San Jose, Cal.



More than 100,000 Farmers and Fruit Growers Use the STANDARD SPRAY PUMP

With it they spray their tallest orchard trees *from the ground* in half the time required by others. The knapsack attachment enables them to spray their potatoes and low growing crops at the rate of an acre an hour or better. They whitewash their barns and chicken coops and spray "dip" on their live stock with the Standard Spray Pump.

Made throughout of brass, with nothing to wear out or break, the Standard Spray Pump lasts a lifetime and pays for itself over and over again.

Warranted 5 Years. Price $4 Prepaid. (West of Denver $5.) Money back if not satisfied.

Send no money but write today for our Special Offer and Catalog M.

The Standard Stamping Co.
918 Main St., Marysville, O.

SPRAY with an ANTI-KLOG

They give the highest efficiency through long hard terms of service. There is an **Anti-Klog** of the right capacity for those who have much and those who have little spraying to do.

They spray better—spray better longer—and represent more downright sprayer value—than any other spraying devices manufactured.

Ease of operation, simplicity, strength and a number of other individual features appeal to every user. The **Anti-Klog** nozzels make it very difficult for any mixture to clog the outlet.

Guaranteed for 5 Years

You are absolutely protected when you buy an Anti-Klog, as each one is sold under an unqualified guarantee of 5 years' service.

Send for our new free catalog. You should now make preparations for spring spraying.

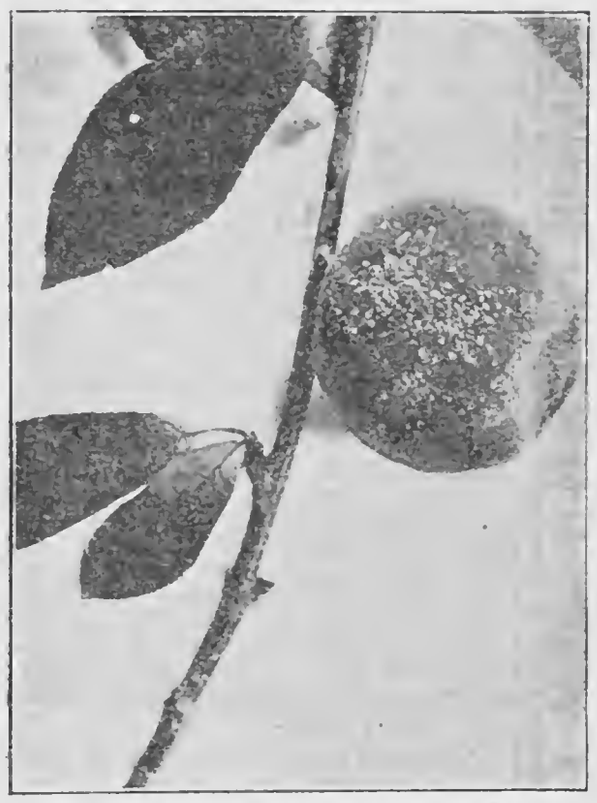
2412 West 22nd Street CHICAGO, ILL.

SPRAYING FOR FANCY PEACHES.

The successful production of fancy peaches is dependent on many factors, not the least of which is the practice of systematic spraying, to control the many insect pests and fungus diseases which attack this most profitable crop. Also, systematic spraying is determined by three factors; knowing when to spray, knowing with what to spray, and spraying thoroughly, all of which are of equal importance.

The first spraying should be made with a mixture of eight or nine parts water to one part of concentrated lime-sulphur. This spraying is for the control of the insect pest San José scale and the fungus disease, peach leaf-curl. It must be applied while the trees are in the dormant state and it is well to delay this spray until well into the Spring, but care should be taken not to delay it too long. If the fruit buds have begun to show color when this spray is applied there is great danger of burning them, and if the leaves have started to show the least bit beyond the buds, it is too late to control the leaf-curl, as the spores of this disease have then had an opportunity to lodge thereon. As the functions of the leaves cannot be carried on when infested with leaf-curl, it is evident that the spray should be applied before the leaves have made their first appearance and the disease obtained a foothold. However, if the peach tree is infested with leaf-curl, it will shed these leaves and then send out a second crop. This is a great drain on the vitality of the tree and every effort should be made to control peach leaf-curl.

CURCULIO AT PEACH PIT.



TYPICAL SPECIMEN OF BROWN ROT.

The second spray should be made with an arsenical poison, perferably arsenate of lead, using three pounds to 50 gallons of water, and should be applied just after the petals have fallen from the tree. This is for the control of curculio which bores a small hole in the peach into which she deposits an egg. With proper conditions this egg hatches into a small white larva which eats its way through to the pit; most peaches infested with this larva fall to the ground as "June drops." The curculio not only deposits eggs in the peach but also feeds upon it. The injuries caused by this feeding afford a fine opportunity for brown rot to enter. By thorough spraying with an arsenical spray, just after the petals have fallen, a great many peaches can be saved from the attack of this insect.

Just after the husks have fallen from the little peaches, the first application of self-boiled lime and sulphur should be made. This spray is for the control of the two fungus diseases, brown rot and peach scale, which are only too well known to most peach growers. This spray should be followed by another application of the same mixture in from two to three weeks. This is the last spraying necessary, except for the very late varieties, which might be helped by a third application of self-boiled lime and sulphur in two or three weeks. However, the last spraying should never be made less than four weeks before picking time. If it is made later than this the fruit is quite likely to have a whitewashed appearance, which is very undesirable. So much for the first two factors which determines systematic spraying. The third factor speaks for itself. Spray thoroughly.

HOWARD L. EARL.

Fruit Planting at Three-score.

The question put by L. F. H., page 186, interested me greatly, as it no doubt did many others situated as he is. I, too, am past the 60-mile post, and have but recently put the same question, and answered it, to my full satisfaction. Of course, in solving this problem much depends on the foundation, or starting point. The first and important question undoubtedly is, what is the condition of the ground which he proposes to plant? Under the most favorable conditions the laying out and caring for a young orchard involves considerable labor; and, where the ground planted is unsuitable to begin with, we can hardly expect satisfactory results within the period allotted to us. But, on ground which has previously been in cultivation, and can be maintained in good condition without too great an outlay of labor, results could be made highly satisfactory. You reply to him that peaches and plums and some few varieties of apples will give early returns, I have found by experience that not only peaches and plums, but apples and pears have given me prompt returns, and have been highly satisfactory. But, and here is the solution, I have planted *all dwarf trees*. These gave me almost immediate returns. Apple and pear trees planted in the Spring of 1913 are now full of fruit spurs, and give promise of a crop of from five to 20 fruits each this Summer. Peach trees planted at the same time show an abundance of double and triple fruit buds.

"SPRAY WHEN THE SHUCKS FALL."

However, it is not alone the prospect of the fruit which has proven so satisfactory; it has been that great pleasure, which you so aptly point to, of seeing the trees prosper and beautify your surroundings, that continual care and attention bestowed, labor which is not drudgery, but a recreation. I never before in all my recollection slept as soundly as I have since I laid out my home orchard! Yes, say to L. F. H., and to all others who have advanced to where they can say "I am 65 years young," go ahead, plant fruit tress but plant *dwarf* trees, and your reward is not far off. L. K.

SPRAY WITH IN-SECT-INE

SPRAYING TABLE

IN-SECT-INE is the only Compound ever mixed that Kills BOTH SCALE AND INSECTS

What to Spray and What to Spray For	What to Spray With	Time of First Spraying
Apples—		
Bitter Rot		First appearance of rot.
Canker Worm	Spray with In-sect-ine	On first appearance of worms.
San Jose Scale	Spray with In-sect-ine	Spray in fall.
Scab	Spray with In-sect-ine	As the buds are swelling.
Asparagus—		
Beetle	Spray with In-sect-ine	Early spring.
Rust		After cutting crop.
Blackberry		
Cabbage and Cauliflower	Spray with In-sect-ine	On first appearance of worms.
Celery	Spray with In-sect-ine	On young seedlings.
Cherry—		
Aphis	Spray with In-sect-ine	At first appearance.
San Jose Scale		Before buds open.
Leaf-spot		Just before blossoms open.
Cucumbers—		
Anthracnose	Spray with In-sect-ine	When plants begin to run.
Downy Mildew		When plants begin to run.
Currant—		
Leaf-spot	Spray with In-sect-ine	As leaves are unfolding.
Worm		When they first appear.
Gooseberry—		
Leaf-spot	Spray with In-sect-ine	Before leaves start.
Worm		
Mildew		When buds are breaking.
Grape—		
Anthracnose	Spray with In-sect-ine	Just before buds open.
Berry Moth		Before blossoms are ready to open.
Downy or Powdery Mildew		Just before blossoming.
Rot		Just before blossoming.
Muskmelon—		
Anthracnose	Spray with In-sect-ine	When plants begin to vine.
Downy Mildew		July 25 to Aug. 1.
Leaf-blight		When plants begin to vine.
Peach—		
Leaf-curl	Spray with In-sect-ine	In March or April, or both, to make doubly sure.
Brown Rot		About time shucks are shedding from young fruit or on first appearance.
Scab	Spray with In-sect-ine	Just as buds begin to swell.
San Jose Scale	Spray with In-sect-ine	In late fall or early spring, or both, if bad.
Pear—		
Leaf-blight	Spray with In-sect-ine	Cut out the branches on first appearance on twigs.
Psylla		In winter, use commercial lime-sulphur for eggs.
Plum—		
Curculio	Spray with In-sect-ine	With starting of buds.
Aphis		On appearance of aphis.
Shot-hole Fungus		When leaves are half grown.
Rot		As buds are swelling or on appearance.
Potato—		
Early Blight	Spray with In-sect-ine	When plants are 6 inches high.
Late Blight		As for early blight to July.
Potato Beetle		When pest appears.
Raspberry—		
Anthracnose	Spray with In-sect-ine	Before leaves open.
Saw-fly		When pest first appears.
Leaf-spot		When leaves are half grown.
Rose—		
Leaf-spot	Spray with In-sect-ine	On first appearance of fungus.
Slug		On appearance of slugs.
Strawberry—		
Leaf-spot	Spray with In-sect-ine	Soon after growth begins.
Squash—		
Aphis	Spray with In-sect-ine	Spray underside of leaves.
Lady Beetle		As soon as pest appears.
Tomato—		
Anthracnose	Spray with In-sect-ine	Soon after fruit begins to set.
Leaf-blight		Three weeks after transplanting.
White Fly		Spray underside of leaves thoroughly.
For Codling Moth.	Spray with In-sect-ine	Spray thoroughly soon as leaves are out.
For Tussock Moth.	Spray with In-sect-ine	Spray thoroughly soon as leaves are out.

UNITED STATES DEPARTMENT OF AGRICULTURE

BUREAU OF ENTOMOLOGY

WASHINGTON, D. C,

December 11, 1913

Dear Sirs:

Referring to sample of In-sect-ine submitted to this office by Mr. J. E. Keating in company with Mr. J. B. Porter, under date of October 9th, I have pleasure in advising you that this preparation has been analyzed in the Bureau of Chemistry and found to consist of a mixture of calcium and lead arsenates, Bordeaux mixture and some crude form of tar oil. It also contains small amounts of sulphates, chlorides, magnesium carbonate and a trace of ammonia.

The various ingredients which enter into the sample of In-sect-ine, as analyzed, are not present in large enough quantities, in the light of our present knowledge, to be injurious to plant life when used for spraying if applied in the usual manner and at proper dilutions. The compound is very similar to a Bordeaux mixture containing arsenate of lead and a little sulphur.

Very truly yours,

L. O. HOWARD.
Chief of Bureau.

A Florida Yam.

The big Florida yam shown herewith weighed 18 pounds—length 27 inches and circumference 21 inches. The amount of food that can be produced on an acre of this vegetable is astonishing. Probably

A Good-Sized Yam.

the banana is the only plant which can surpass it. How thin light soil can produce such crops is a marvel.

Apple Orchard on Side Hill.

Five years ago I brushed a 3½ acre side hill and put in apple trees and plums for a filler. The land was rough. I kept it brushed until last Summer, when I took the above off and plowed the land, sowed rye, in which condition the plot is now. I am advised to sow clover in the rye in March, let the rye mature preparatory to clover for permanency. Would you advise to plow the rye under in the Spring? I have no team of my own to do the work; help of that kind is very scarce, especially so at that time of the year. The former course would suit me better, as the clover would be less work for a team, only I do not know whether the ripening of the rye would deplete the land more than the grain. The land is not sour, had plenty of wood ashes from burning brush and also considerable decayed leaf-mold. J. S.

Port Jervis, N. Y.

You can sow clover on the rye this Spring. From choice we should like to run over the rye with a weeder, just after the clover seed was put in. Let the rye grow until it begins to form seeds. Then cut it promptly and pile the whole of it around these young trees, over a space five or six feet out. Before you pile the rye put on about two pounds of good fertilizer around each tree. Then let the clover come on, clipping it from time to time, so that it will not make seed. This is the cheapest way of handling the orchard. The trees will not make as good a growth on this plan as they would if the rye was plowed under, thorough culture given up to August, and then rye seeded again, but the plan of piling the rye around the trees saves labor and plowing, and is a method within reach of your own labor without hiring, except for cutting the rye. If the trees are of fair size, we should follow the plan of cutting and piling the rye and leaving the clover.

Coloring the Lime-sulphur Spray.

The time is approaching when the fruit grower will have to go into the orchard to battle against insects and tree diseases. I suppose a large majority of the fruit growers use the lime-sulphur spray, and no doubt all of those who use it have studied the formula for making it and the manner of applying it. I have read a number of experiment station bulletins, nursery catalogues, and circulars issued by the makers of lime-sulphur solution. In none of these that give the formula for making the lime-sulphur spray, is any mention made of the addition of a coloring substance to the spray mixture which will enable the operators of the spraying machine to know positively which trees have been sprayed. It has been my practice to mark the first and last tree sprayed with a given tankful, by using a brush with whitewash. Sometimes the men forget to mark the trees, then we have to depend on the driver or some one of the operators, and again the track of the sprayer is used as a guide, which is not satisfactory, and leads to disputes. It has occurred to me that something could be added to the lime-sulphur spray to color it so that it could be easily seen after it is on the trees. Of course whatever substance is used to color the spray, it must be something which will not lessen the efficiency of the spray. The naming of this coloring matter and the amount used to the gallon of spray, it seems to me, should be the work of the chemist.

Illinois. CHARLES HEAD.

R. N.-Y.—There have been several similar suggestions before. We would like a discussion of the subject.

Rome Beauty Apple in New York.

I have not yet had much experience with Rome Beauty. I am planting them only as fillers in a Northern Spy orchard. The general impression is that this apple does not do well in New York State. However, I have seen some very handsome specimens grown here by the lake. I am using them as a filler with Spy, because the blossoming season comes at the same time and so does not interfere with the spraying. I am planting extensively good old Rhode Island Greening, Northern Spy, Tompkins King and Esopus Spitzenburg, using as a filler in Greenings, the Wagener; in King Twenty Ounce; in Spitzenburg McIntosh, and in Spy, Rome Beauty. I consider the Spy as grown here on the lake one of our best commercial apples, an annual bearer, although requiring a great deal of care in pruning, cultivating, especially in spraying, and in handling and packing. Simply the prices it brings in comparison with other varieties, this year $7 per barrel for No. 1 and $4.25 for No. 2, make it one of our best money-makers.

Wayne Co. F. W. CORNWALL

On advice of S. D. Willard about 10 years ago I planted 30 Rome Beauty. They came into bearing five years after planting and have done well since; no Winter injury at all. Since these trees have come into bearing I have planted a good many Rome Beauty. Part of these have come along all right and part have shown a good deal of Winter injury, especially one-year old trees and trees planted in Fall. We are planting now only two-year-old trees and planting them in the Spring.

GRANT G. HITCHINGS.

Onondaga Co., N. Y.

I have no trees in fruiting, but have observed it at the New York State Experiment Station at Geneva, and upon fruit forms in both Western New York and the Hudson Valley. In all three instances it was proving a first-class commercial apple. The tree may not be hardy enough for the colder sections of the East, and it is not a very vigorous grower. It has qualities such as hanging on late, good color, fair quality, tough skin, etc., that make it very hard to find a substitute. I know of none.

New York. B. D. V. B.

SWIFT'S
ARSENATE of LEAD

Is death to all leaf-eating insects.
By its use you can
Save your fruit, vegetables, potatoes, berries, truck gardens.
HIGHEST QUALITY

Don't Pay Freight on Water
Spray with
NIAGARA BRAND Soluble Sulphur Compound
(in Powder Form)

Dissolves instantly in Cold or Hot Water. Takes the place of and is superior to Lime and Sulphur Solution for Controlling—

San José Scale and Fungus Diseases
Also has Controlled Aphis at the same time

THE BEST ALL-AROUND SPRAY FOR APPLES, PEACHES AND PEARS

For nine years we have manufactured Lime and Sulphur Solution. Three years ago we succeeded in putting out this material in dry form which has met with the universal approval of fruit growers because it has the following—

Advantages over Lime and Sulphur Solution

A 100 lb. Drum Soluble Sulphur Compound equals a 600 lb. bbl. of L. & S. Solution. ⅙ the freight. No leakage. Does not crystallize. Will keep indefinitely in any climate. No barrels to break or return. No water to pay freight on. Controls San San José Scale in four days, sticks like paint, etc. Reports from the Government, Fruit Growers and experimental Stations covering a period of three years substantiate the above.

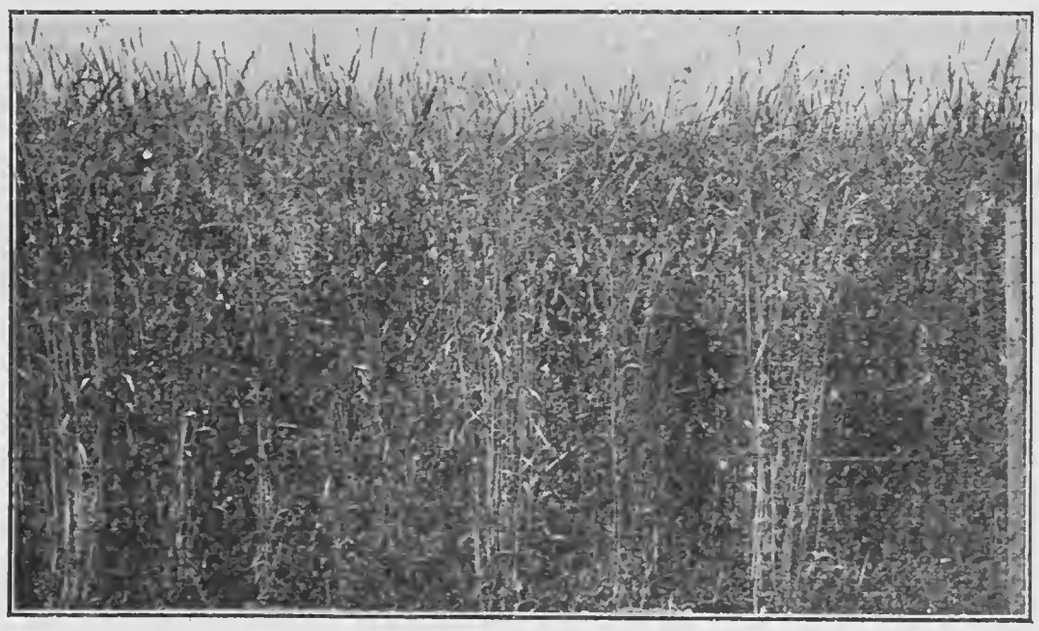
COVER CROPS IN EASTERN STATES.

The interest in this method of improving the farm continues unabated, and with good reason, for many owners of poor sandy land have been enabled to grow profitable crops with the aid of Crimson clover, vetch, cow peas, Soy beans, Alfalfa, etc. Many farmers no doubt use some of the legumes noted above with good results, but there are countless thousands who need a little encouragement of a practical nature. The county agent, by public demonstrating, is working on the right line, and gives the farmer something definite to think about. But cover crops are not always a success and some thrive in one part of the country, while they are a failure in others. This being so, this article will deal only with conditions in New England, Long Island and Delaware and vicinity. In New England the cover crop question has not been taken up in a general way until lately. The boom in Alfalfa has only been with us since 1910. Hairy vetch has been grown in the Connecticut Valley for several years, but outside of that locality you rarely see it growing. Crimson clover grown as a cover crop is almost unknown. Probably the most valuable cover crop for New England will be Hairy or Winter vetch.

The high cost of seed has prevented many from trying out the various legumes for green manure or cover crops. It is not necessary for the average farmer to pay out a lot of money for expensive seed, for he can grow it on the farm and thus make a great saving. The writer has been growing Hairy vetch for seven years, and has never bought a pound of seed. Anyone can do the same. A small quantity was presented for trial purpose, and one cupful of excellent seed was saved for Fall planting. Three seeds were planted by hand at the base of asparagus plants, the cupful planting three rows 300 feet long. The vetch plants used the asparagus plants for support and the next year in June over 30 pounds of seed was harvested. That year in August the seed was planted in rows and the plants were bushed with small birches. The next year after harvest the land was wheel-harrowed and smoothed, enough seed escaping to self-seed the whole area. Rye is now sown with the vetch to support it enough to ripen a fine lot of both kinds, these being harvested together for future plantings. For obtaining the above crop of seed sandy land was used, but no manure or fertilizers, inoculation or lime have been applied, the land getting richer each year. Vetch and rye make a good Summer fodder cut early to feed green and later makes a good hay. This crop should be sown broadcast in July or early August and covers the ground completely during the Winter. Vetch and rye start very early in the Spring, thus giving a lot of green material to plow under or to feed the cows.



COVER CROP OF RYE AND VETCH.

Crimson clover sown with vetch in July or August makes a wonderful cover crop. In New England the vetch is sown with it to help it through the severe Winters. The open changeable weather of March is likely to kill Crimson clover alone, hence the value of vetch planted with it. Crimson clover in New England is used to protect the barn soil in Winter and to hold the snow. The soluble nitrogen in the soil during the Fall is also taken up by the clover plants is used mostly to protect the bare soil and stored for use by future crops. In Delaware a great many crops are planted to Crimson clover after the last cultivation. It is refreshing to learn in these days of lime and inoculation that neither lime nor inoculation are deemed necessary by many farmers in Delaware and New Jersey. In this section Crimson clover furnishes the crop with about half of its nitrogen. Asparagus is greatly helped by Crimson clover and vetch, keeping the ground well covered and storing great quantities of the costly nitrogen. For asparagus beds the sowing should be made in late July or August 1 to 10. The Fall growth of Crimson clover in New England will pay for the trouble of planting even if you are sure it will winter-kill in March or April. The writer has knowledge of Crimson clover being grown for 22 years in Massachusetts with very slight winter-killing. Give it a chance, grow your own seed and in time you will make the word failure in Crimson clover look very small.

On Long Island, N. Y., cover crops of numerous kinds have been very successfully grown at the Long Island Railroad's experimental farms. Farmers will be well paid to take the trip out to Medford, L. I., to see what is being done to demonstrate the possibilities in sandy land. Most of the legumes are planted there and have made good. Alfalfa makes wonderful crops. Cow peas, Soy beans, Crimson clover and vetch give good account of themselves when intelligently cared for. Velvet beans planted on sandy soil has made a growth of 30 feet in one year. The foliage is profuse and causes a great improvement in fertility. It should be planted about May 10. For orchard planting Soy beans should be sown middle of June and in asparagus every four rows in between two rows. Ito Soy bean makes a wonderful lot of foliage and carries enormous quantities of nodules on the roots. The Volunteer, a cross between Ito and Nuttall, is a big yielder and carries quantities of nodules. Crimson clover should be sown June 1 and Hairy vetch in August. Alfalfa is sown there in April. Soy beans mature seed at Medford and it should be saved by all means. Crops grown on Crimson clover sod are three to four times as large as those grown elsewhere.

Cow peas do well here and can be sown broadcast in asparagus to stay through the Winter as a cover crop thus improving the soil. This cover crop question is so large and so much should be said that one hardly knows where to stop, however if demonstration plots can be arranged for and farmers will show up, great progress will surely be made. With inoculation and lime where necessary and an honest desire to learn on the farmers' part, great results may be expected in the near future.

Massachusetts. C. W. PRESCOTT.

"You think the American people lack a sense of humor?" "Yes," replied the frank visitor from abroad; "otherwise you wouldn't find so many people weighing over two hundred pounds who dance the tango."—Washington Star.

"DEATH, TAXES AND The Mapes Manures

Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

Hope Farm Notes

The Real and the Ideal.

We have them both in horticulture or rather we have much of one and great need of the other.

THE REAL THING.—Here are a few actual questions which have come in recently:

1. Do you think my peach buds are damaged?
2. There has been frost in my cellar where the seed potatoes are kept. Do you think they will sprout?
3. I have a field quite low and wet. Do you think it is sour?
4. Do you think I can graft tame cherries on the wild choke-cherries growing on my farm?
5. I hear much about peach borers. Do you think my trees are likely to be affected?
6. I thought you said wood ashes will injure hen manure. I mix the two and can smell the ammonia—therefore I know it is very good!
7. I am tired of working for others. Do you think it would pay me to buy a horse and wagon and peddle fruit and vegetables?

These are actual questions, and we have many like them. The most suitable text I can think of for answer is:

"He is of age—ask him!"

I should ask the peach buds by cutting a few and bringing them to a warm room and putting the twigs in water. Ask them and they will tell whether they are able to put out bloom or not. The same with the seed potatoes. Take a few fair samples, cut as you would for the field and leave them in a sunny window or plant in boxes or pots. They can beat the Hope Farm man in telling how much life they have left. Also the field. Why not test it with litmus paper? Take a cupful of the soil—a fair sample—make a knife hole in it and put in a strip of blue litmus paper. Press the soil around it. If it turns red the soil needs lime. As for grafting tame cherries on wild stock I doubt it, nor can I see why it should be done, but here is another case of "ask him." Try a few and see how it comes out. You will also have to ask the borers. Usually, these insects work into all peach trees where any number of them are grown. Dig away the soil at the foot of the tree and hunt for the gum and the little burrows which the borers make. If they are there cut or dig them out. We did say that wood ashes will injure manure and here we repeat it. The fact that you smell ammonia is sure evidence of this injury, for the ammonia which you smell is passing off into the air as a gas. When once mixed with the air you have lost it. If a careless child opened the bird cage and let the canary fly away you would hardly claim that the child was a great help in making canaries. Yet the gas and the bird are both lost when they get into the air. You may catch the bird but the ammonia is lost. When you mix in wood ashes you *ask the hen manure*—but somehow you got the wrong answer. As for peddling you will have to ask the job. You will find it still more tiresome working for yourself when the bills are to be paid. Good peddlers are like poets in one way—they are born, not made.

You would be surprised to know how many of such questions we receive. No stranger can possibly answer them. One might make a bluff or a guess but the best advice is "ask him." The mental exercise required to experiment and observe and take accurate records is the best thing for a farmer or gardener, for it is along these lines that men learn to think for themselves and this makes progress.

THE IDEAL.—The real thing is all right—a necessity in life—yet the ideal is greater, for without it no lasting success is possible. As another text for this I would take one used by President Thomas of Middlebury College in a sermon to his graduating class:

"Is not this the carpenter, the son of Mary, the brother of James and Joses and Judas and Simon? Are not his sisters here with us? And they were offended in him."

The people of that little village in Judea could not realize that a man of this plain, common stock could do the wonderful things which were reported to them. How could an ideal come out of the dust? Ever since the world began to take notice of ideals men have gone hunting for them in the sky or over the hill in the next county. We have got into the habit of looking at the stars rather than at our feet. Yet we live and move and work *on the earth.* The far-away places and the inhabitants of the stars do not need our ideals half as much as those who live right in our own valley—neighbors and friends. Many of us have come to regard the ideals of life much as we do the black suit of clothes or the silk dress tucked away in cedar or moth-balls and taken out now and then for some fine occasion. We need to dress these ideals up in overalls and boots, so they can go with us right out into daily work. I have seen old soldiers with a rusty sword and a flag hanging on the wall. There was their ideal of devotion to country. They might have served their country better by carrying that ideal out with the hoe and scythe instead of leaving it with the sword. I am talking in this way because I want you to think out the meaning yourself—without having it all explained. We must put our ideal right into our own work—not lock it up for special occasions. An ideal represents the cleanest, strongest, most satisfying thing in a man's life. It is the one priceless thing which he would take most pleasure and confidence in laying right upon the altar for all to see. And here is what I mean by carrying this into everyday life—dressing it up in overalls and boots. Let every nurseryman put a piece of that priceless thing into every box of trees he sends from his nursery. Let every fruit grower and gardener put it into every package that leaves his farm for sale. Let them plant it in the soil as treatment for their farms, and let them put it into every contract or argument they make with their fellowmen. That is the way to idealize the humble things of life—put that part of yourself which you are not ashamed of right into them. H. W. C.

A Fertilizer for Corn.

I have an upland field, sandy loam soil, rather thin, on which was grown a crop of silage corn last year. I wish to raise silage corn on it again the coming season, and would like to know what fertilizer to use. The field was given a heavy coat of barnyard manure last season; I do not wish to use any manure this year, but nitrate of soda alone, or with muriate of potash, if the nitrate would not be sufficient. How much of the nitrate, or of the nitrate and potash together, should I use, and how would it be best applied? To my knowledge lime has never been used on this soil; would it probably be of benefit to the corn crop to apply lime also? F. S. F.

Griffin Corners, N. Y.

You cannot expect to raise a good corn crop by the use of nitrate of soda alone, or nitrate mixed with muriate of potash. Phosphoric acid must also be used on that kind of soil to make a complete fertilizer. The nitrate is not the best form of nitrogen for the growing crop. In fact, many good farmers would not use nitrate on corn under such conditions. The nitrate gives the most available form of nitrogen, and is thus the best form to use for the early growing crops of oats or grass, which must make their start and grow in the cool part of the Spring, when the ground is cold and nitrates are not formed in it. The corn plant makes its heavy growth late in the Summer, when the ground is warm and nitrates are readily developed in it, from organic forms. Thus the best fertilizer for the corn crop carries this nitrogen in organic form, which will be broken up and made available late in the Summer.

Dried blood and tankage are, therefore, better for the corn crop than nitrate of soda. On such soil as you mention, a mixture containing two parts of tankage by weight, five parts acid phosphate and two parts muriate of potash ought to give results on the corn. If you have had no experience in the use of fertilizers it would probably pay you better to buy one of the ready-mixed brands for corn. On such a soil an application of ground limestone would probably pay well.

"WHAT is a hobby, mother?" asked Freddie. "Something people are very fond of," replied mother. "Oh, is it?" exclaimed Freddie, very much surprised, "I thought it was a husband!"—Melbourne Australasian.

Who Loses the Money

When the critical moment of the spraying season is at hand and the sprayer breaks down?

Surely Not the People Who Made the Sprayer or the Dealer Who Sold It To You

You know very well that you are the biggest loser when the greater part of your fruit goes to waste because your sprayer did not work properly.

Make sure of getting full crop from your trees by buying *The "NEW-WAY" Rapid High Pressure Power Sprayer.*

Made complete in our factory. Large ball valves. Free passage of solution.

The spraying season is close at hand so write for our S-5 catalog *now.*

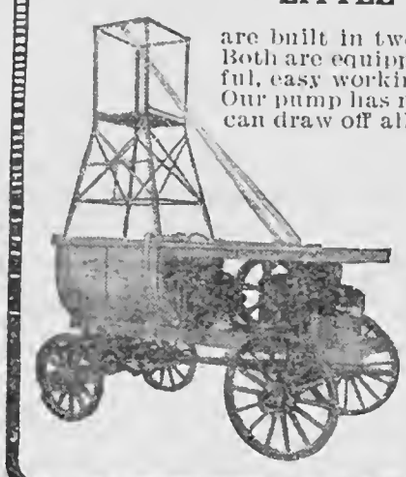
140 Sheridan St. THE "NEW-WAY" MOTOR COMPANY LANSING, MICHIGAN, U.S.A. 140 Sheridan St.

LITTLE GIANT SPRAYERS

LIGHT RIGS WITH LOTS OF POWER

We make a complete line of Sprayers for Orchard, Field and Vineyard, both Hand and Power Types, designed and built under the personal supervision of a practical man who has learned what to build into his machine and what to leave out by operating machines in the orchard and field. Little Giants are built to stand up under hard work, and so constructed that they put the spray where you want it. They combine maximum power and strength with minimum draft weight, so that they won't kill horses on rough, heavy ground.

LITTLE GIANT ORCHARD POWER SPRAYERS



are built in two sizes with tanks of 200 gallons, and 100 gallons capacity. Both are equipped with a special pump of our own make, especially powerful, easy working, and so simply constructed that every part is accessible. Our pump has many practical features like pet cocks through which you can draw off all the water and prevent freezing.

THE PUMP WITH THE CLUTCH

is a little Giant feature. By throwing out the clutch the pump may be stopped without stopping the engine or interfering with agitator. It's a great advantage to be able to crank the engine without having the pump attached. You can also mix your solution thoroughly before starting spraying. Little Giants are giving extra satisfactory service to many growers. It will be worth your while to write for our catalog and prices.

W. C. AKINS MACHINE COMPANY

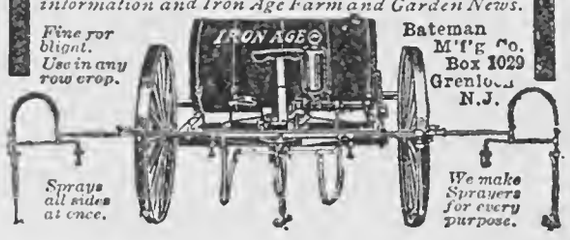
976 INSURANCE BLDG., ROCHESTER, N.Y.

Something New In Traction Sprayers

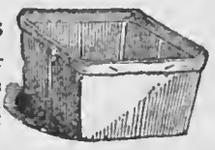
Sprays 4 rows with 12 nozzles, 3 on each. 8 are low-down nozzles for still more thorough spraying of sides and underside of vines. Spraying saves your crop and *increases the yield.* One of a dozen

IRON AGE FOUR and SIX-ROW

Traction Sprayers, 55 or 100 gallon wood tanks, double or single acting pumps, wind shift, nozzles, strainers, thorough mixing, no corrosion. Ask your dealer about them and write us now for *new "Spray" book, spray information and Iron Age Farm and Garden News.*



Get Low Prices on Berry Boxes and Baskets



Write for our Free Catalog! Shows you how you can save money by buying direct from *the largest Berry Box and Basket Factory in the Country.* (3)

NEW ALBANY BOX & BASKET CO., Box 111 New Albany, Ind.

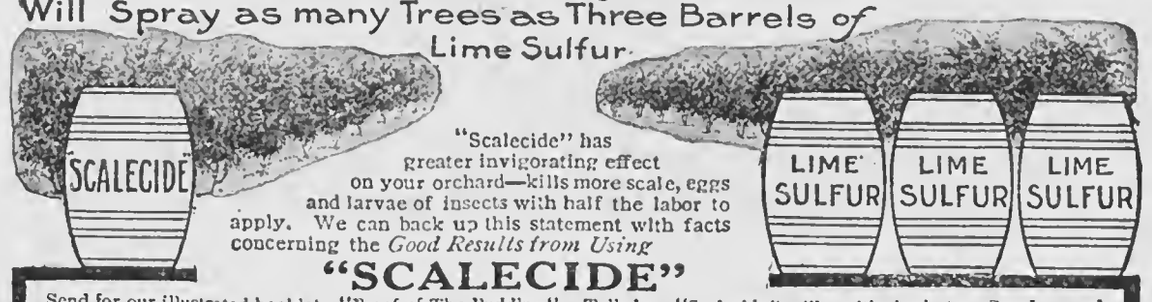
COMPRESSED AIR SPRAYERS

The foremost orchardists of the country are installing our system rapidly, recognizing superiority, durability, economy in initial cost, weight, time and labor with **no machinery taken into orchards, therefore nothing to get out of order.**

"One engine will run any number of tank outfits"

W. H. OWEN SPRAYER COMPANY
Sandusky, Ohio

One Barrel of "Scalecide" Will Spray as many Trees as Three Barrels of Lime Sulfur



"Scalecide" has greater invigorating effect on your orchard—kills more scale, eggs and larvae of insects with half the labor to apply. We can back up this statement with facts concerning the *Good Results from Using*

"SCALECIDE"

Send for our illustrated booklet—"Proof of The Pudding". Tells how "Scalecide" will positively destroy San Jose and Cottony Maple Scale, Pear Psylla, Leaf Roller, etc., without injury to the trees. Write today for this FREE book and also our booklet—"Spraying Simplified".

Our **Service Department** can furnish everything you need for the orchard at prices which save you money. Tell us your needs.

We are World Distributors for VREELAND'S "ELECTRO" SPRAY CHEMICALS and Arsenate of Lead Powder (33 per cent), which, used wet or dry, has no equal in strength or texture. Avoid imitations.

B. G. PRATT CO., M'f'g Chemists Dept. N 50 Church Street, New York City

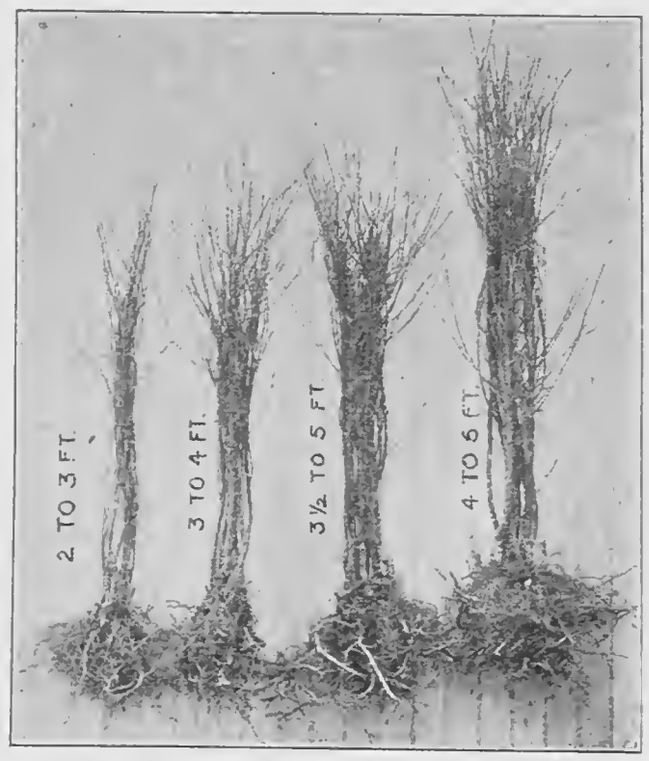
Two Generations of Black's Trees

EXPERIENCE GIVES OPPORTUNITY TO LEARN. A determination to excel, a love for the work together with experience is a powerful combination destined to give the very best results.

Nowhere in the industrial world has the purchaser of a product more at stake than the planter of

Nursery Stock

When the VILLAGE NURSERIES send you nursery stock it is backed up by two generations of experienced nurserymen and fruit growers. Jos. H. Black, with his fifty-five years of active participation in his chosen life work, who as a mere lad showed his love for and devotion to its greatest advancement by inventing the first tree digger ever used in a nursery and by budding twice the number of trees of the average workman of that time. His son's first memories were of trees and plants, discussions of varieties and best methods of growing, budding, grafting, digging, grading and packing. He was the first to beat his father budding, doing it at the age of sixteen, his record of 820 trees in one hour and 3,500 for five hours has never been equalled.



NOTICE THE ROOT GROWTH

Peach Trees graded and tied in tens ready for shipment

These men have always been trying to grow the very best possible trees, giving nothing in varieties or stock but such as they positively know would be best suited to the planter. These men now stand back of every tree shipped

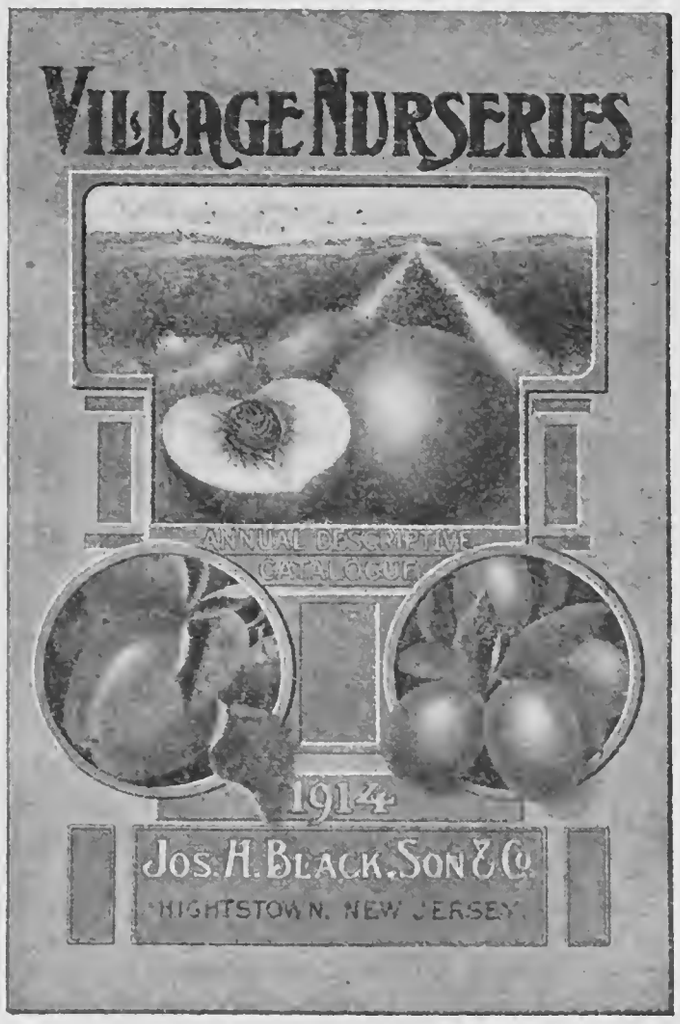
From Black's Nursery

Every variety offered has been fully tested out for hardiness, sturdiness and adaptability to your needs. The fruits are propagated exclusively from stock that we know to be true to name. Buds and grafts are selected from healthy trees and cut under the direct personal supervision of our Walter C. Black.

Not a tree or shrub is shipped from these grounds that has not been personally inspected by him at sometime and all fruit trees are under his constant supervision during growing, digging and packing seasons. We have been urged repeatedly to increase our output and devote more time to the selling end but seven years ago we determined that we would grow only such quantities as could be grown under this direct supervision.

Our idea is to grow trees and sell direct to the planter. These trees, to be offered at only a fair margin above cost of production, will be appreciated to such an extent that they will sell themselves at our prices regardless of the prices others are quoting.

You plant fruit and ornamentals for the home expecting good fruit and a good appearance or you plant fruit for profit expecting good crops and good returns. To get these results you must have good trees and plants. To be sure that which you are getting



A reproduction in black and white of the Catalog which gives but a poor idea of its appearance in its beautiful colorings

Is What You Want

you should never consider a few cents in the purchase price but buy of the man whose experience ensures a thorough knowledge of his work and whose personality is evident in every individual article you receive.

We shall never make a big fuss over any new fruit until we *know* it is a BIG thing for *YOU*. We are always in intimate personal communication with the highest authorities in our Experimental Station and would rather *burn a hundred trees* than send out *one* which would not meet with their approval.

We advertise very little because our trees are selling themselves but we do know that readers of that best of all farm publications, The Rural New-Yorker, know and want the best things going and we want that class of customers because they can appreciate what we are doing.

OUR CATALOGUE

We have ready for free distribution a catalogue that tells you what you want to know in as few words as possible and is fully illustrated. The four-color cover is suggestive and beautiful.

ADDRESS

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

WHAT *does an apple orchard cost?*

That question is repeatedly asked by men who are considering fruit growing as a business investment. They can get figures regarding nearly every other line of business. What about an orchard? We think Mr. Burritt's figures are accurate. Some of the "boomers" will say they know men who have done much better and established orchards for less money. We are content to let the "boomers" blow themselves elsewhere. We want fair and honest statements, and Mr. Burritt's figures may be accepted as such. We would like to have them compared by men who have kept books, and can tell just what has happened in the orchard.

*

AT the State Fruit Growers' meeting at Poughkeepsie, the president, L. L. Morrell, made this statement:

We have two classes of men within our ranks who have been serious drawbacks to us in our work in getting bills through the Legislature. These are the timid man who will not stand up for what he really ought to have, and the man who is continually asking for what he ought not to have.

Mr. Morrell is right. The timid man and the man who wants everything are to be found in every effort to obtain legislation. The politicians know how to make capital out of both of them. They bluff the timid man, so he does not dare to say a word, and they point to the extremist to prove "that those farmers want the earth." Both classes of men should get together for what is fair and fall in behind their leaders with whole-hearted support.

*

I READ with amazement on page 257 of THE R. N.-Y. that "it is hard to say definitely just why sweet potatoes should be so low at this time." We are only a hundred miles from Vineland, and our town borders on New Jersey. A local grocer charged me 10 cents a quart for sweet potatoes to-day, and he would have fainted had I asked for a peck or a bushel. I pay $1.25 a bushel for Irish potatoes. You will have to lower your 35-cent dollar, I think. ALBERT C. MAYHAM.
Orange Co., N. Y.

Still there are people who say there is no such thing as a 35-cent dollar. Here at one end of the line sweet potatoes are so cheap that farmers are seriously considering giving up their culture. At the same time, 100 miles away this man is paying 10 cents a quart! It is true that in some individual cases the margin between producer's and consumer's price is small. For example, we are told that many gallons of milk are sold here at five cents or less per quart. True, but this is not the price to the final consumer. A restaurant may pay five cents for a quart of milk and sell it in three glasses to consumers at five cents a glass. This 15 cents is the consumer's price. When we talk about the 35-cent dollar we give the *average*. When one man shows that he gets 95 cents of the dollar we can match him with another who had to pay the commission man, since his produce did not bring enough to pay for freight and cartage.

*

THIS seems to be one of those years when certain fruit growers think they can get along without spraying. These seasons come periodically. This year it seems to be the parasite which is to clean out the scale. In other years it was reported that the scale was "dying out" or "weakening." We must confess with some shame that a few years ago we listened to the tempter and did little spraying. It was an expensive play with temptation. The scale woke up in June and did great damage to the crop. Never again! We cannot possibly impress upon our friends too strongly the folly of giving up spraying. Do not under any circumstances whatever listen to the false prophets who tell you the scale will take care of itself or be destroyed without careful work on your part. Take it from us that if you do you will be sure to regret it. We do not tell you what to use or what outfit to buy—leave that to your business judgment—but be sure to fit yourself out with strong power and fixtures and plenty of material, and then "go to it!"

*

UNDER "The Home Acre" this week you will find plans for beautifying a small place. Next week there will be similar plans for arranging yard and flowers around a farmhouse. Such work will be made a prominent feature of THE R. N.-Y. in the future. We are prepared to suggest plans, give estimates and name suitable shrubs and trees for any location. This idea of "fixing up" and beautifying the home grounds at moderate cost is a fine thing for farmers to consider. A good lawn and garden will make the farm home brighter and better, and also add to the value of the farm. There is no question about the latter proposition. Arranging the home grounds in good taste is like grading up the herd with pure blood. We can give you the practical advice of a skilled landscape gardener, and it will be a pleasure to help beautify that yard. In years past we have given thousands of climbing rose bushes to our readers. You ought to see them now in blooming time, giving a great dash of color to many a farmhouse. Now we want to help beautify the yard.

*

THE Supreme Court has struck the Pure Food laws a hard blow in a recent decision. A question of vital importance came before the Court in the "bleached flour" case. In this case the Government sued the Lexington Mill Co. because it used nitrogen peroxide for bleaching flour. The mill company admitted using this poisonous gas, and also admitted that the flour contained a small quantity of the poison. The defence was that there was not enough of this poison to be injurious. On this evidence the lower court decided for the Government. Now the Supreme Court has reversed this ruling. This court claims, in effect, that before a food manufacturer can be punished for poisoning food it must be shown that there is enough of the poison in the food to actually prove dangerous to health! Thus hereafter the Government will be at the disadvantage of being compelled to satisfy the court that there is enough poison present to kill a human being. Think of the difficulty of doing this while the food poisoners are able to buy and control the testimony of doctors and scientists from great universities with their poisoned dollars. It may be necessary to kill an army of men with this poisoned food before the court will be convinced that it is "injurious." Even then the poisoners can hire "experts" to show that the dead men died "from want of breath" or some other "obscure" cause. This decision is a hard blow at a useful law. No use blaming the Supreme Court. Congress is the place for our fight. Let us get after Congress to change and strengthen the pure food law, so as *to prohibit the use of all poisons in food.*

*

WE find that some fruit growers are quietly starting what they call a lightning Babcock test for nursery trees. These men cut scions from the trees as they came from the nursery—taking pains to preserve the labels and keep the records straight. These scions are used for grafting on strong, well-matured trees. A careful "map" is made of this testing tree, and when this grafting wood produces fruit they can tell about the "misfits" several years ahead of the old plan of waiting for the young trees to bear. Of course it is necessary to use the best of judgment in doing this work, but it gives a good line on the quality of the nursery stock.

*

PARCEL POST is in real danger. Its success thus far has sent the old bloodhounds after it. The Senate Committee on Post Offices has adopted the following proposed amendment:

And provided futher that there shall be no changes in the existing weight limits, rates of postage or zones of fourth-class mail matter until authorized by law.

The object of this is to cripple the parcel post system. Under the present law the Postmaster General need not go to Congress and ask for every little change on rates, weight or service. Within certain limits he may go ahead and improve the service when he finds it necessary. The present Postmaster General is in favor of rapidly extending the system—increasing the weight limit and decreasing rates. Let him alone and he will compete with the express companies and improve the service. The proposed amendment would absolutely destroy the power of parcel post to compete with the express companies. These companies would succeed in capturing all the profitable traffic. We all remember what a struggle we had in obtaining the present parcel post. Let this amendment be carried and the fight will be harder than ever, because Congress will refuse to change rates and thus play right into the hands of the express companies. The same old "careful consideration" Congressmen are working this scheme. There is nothing to do but bring out the inkstand and *lick a stamp for parcel post.* Get right after your Congressman and Senators at once and ask them to help kill that amendment.

*

IT is true enough, as the Governor says, that there is already sufficient law to authorize co-operation in the marketing of farm products. The only question remaining is whether the State should spend anywhere from $25,000 to $50,000 in paying organizers to help the farmers do what they ought to be able to do for themselves. No one will doubt the value to the farmer and the consumer alike of co-operation in rural districts for the shipment of agricultural products to cities and towns; but this educational process might very well be made the business of organizations in which farmers are already interested, rather than the business of the State.

This is taken from the Brooklyn *Eagle*, referring to Governor Glynn's call for legislation to provide for organizing farmers into coöperative marketing groups. It represents the feeling held by many city people regarding farm education. They do not object when the nation or State spends money in telling farmers how to *produce more food.* That may mean cheaper food for them, and they favor it regardless of its effect upon the producers. Such people think the farmers ought to be satisfied with the education in production as their share and let manufacturers, railroads and other interests take tariffs, subsidies and special privilege. Thus when an effort is made to give the farmers needed business training such people as we have mentioned object though they must admit the need of such education. The fact is, that every civilized nation of Europe has recognized the necessity of organizing its farmers for business purposes. New York State is not attempting a new thing, but is making a belated start at a necessary reform.

BREVITIES.

YOU are right—when the head of the house gets into trouble it is a case of parboiled.

HONEST, now, do you think a farm without any garden a good place to hold a child to farm life?

IT has been found that the same germ which causes a disease on the leaves of nasturtiums also causes a disease on sugar beet.

"WOOD-PILE DAY" is in order. No one can compute the sickness and trouble found in country homes—due to a lack of dry fuel.

THE great test of character is not so much what we say about people as what we would like to say and yet keep ourselves from saying it.

THE Department of Agriculture reports that many horses have died of blind staggers, caused by eating moldy baled hay. When this hay was opened up to the sun there was no further bad effect.

A BILL has been introduced in the New York Legislature to compel baking-powder manufacturers to mark on each can "a statement of all of the ingredients contained in the powder and the amount of available leavening gas in cubic inches."

THE demand for information about lime continues. The New York Experiment Station at Geneva has issued Circular No. 27 on "Ground Limestone for Soil Improvement." It is an excellent pamphlet, which will answer many of your questions.

REFERENCE is made in the report of the Western N. Y. Horticultural Society to the fact that contact with strong tobacco extract used in spraying may cause nausea, being in fact slight nicotine poisoning. The florists' remedy for this is hot black coffee.

WILLIAM ROBINSON, the famous English horticultural authority, writing to the London Times, says that the best apples in the world are American apples, and the best variety of all is the Newtown Pippin, which he uses six months of the year.

THE chestnut bark blight is referred to on page 334 as Endothia parasitica. We have previously referred to it as Diaporthe parasitica, while a still later authority calls it Valsonectria. It remains equally destructive under all these impressive names.

WITHIN the past few days at least a dozen people write that they are mixing the hen manure with wood ashes and think they are doing a fine thing. So they are—putting a fine upon themselves by losing the ammonia in the hen manure. We did think we had made that one point clear.

THE Department of Agriculture suggests a course at an agricultural college as a better prize for boys and girls' contests than trips to Washington. A sensible suggestion. We question the value of carrying a crowd of boys about on a junket trip.

FARMERS' WEEK AT CORNELL.

PART II.

It is useless to try to describe all the things that you saw, or repeat all the things that you heard, at Farmers' Week. If all of the hours of the day, of all the days of the week, that you could spend there, didn't suffice to give you even a glimpse at everything on the programe in which you were interested, how could they be described in a column or two of print? But there were some things which must be mentioned. We can take it for granted that the scientific side of agriculture was well displayed; that is what an agricultural college is for. If one went there to learn, knowledge was spread before him in the most attractive manner; he could have no one but himself to blame if he went away empty. But there is another side to agriculture that is even more important than the scientific side; and that is the home side. Without the development of this, agricultural science is the sorriest kind of failure.

When our farms become merely work shops, and laboratories—but they must never be allowed to become merely these. The women see this; and it is to the women that Farmers' Week owes much of its value and attractiveness. The new building for home economics afforded space for some of the finest things of the week; and when audiences overflowed that, the splendid new auditorium, seating several thousand, was close at hand. In the basement of the first building was the cafeteria, and family groups about the small tables, and the long "bread line" doubling through the corridor, and stretching up the stairway to the floor above, showed the appreciation in which it was held. The deliciously prepared food, at extremely moderate prices, made one wonder who was standing the loss at the financial end.

Women understand the uselessness of trying to uplift the man with an empty stomach; so while the necessary foundation was laid in the basement, the work of developing the spirit was carried on in the auditorium overhead. Not only were the practical details of housekeeping discussed, but the no less practical value of art, literature, and music, in home making was demonstrated by experts. Miss Hazard showed how valuable and interesting historical novels really are; Miss McCloskey made art in child rearing, in literature, and in environment, a really tangible thing; while Mrs. Morgan performed the miracle of opening the ears of some, musically deaf, to the sublimity of music. Not classical music, beyond the reach of most of us, but the music of the heart and of the home. To few is it given to combine such technical knowledge and skill with an appreciation of the true mission of music and fervent desire to make it minister to all that is best in life.

But to mention a few names is only to seem to discriminate where no discrimination is called for; one can only tell, however, about those things which he himself was fortunate enough to hear. One of the finest of these, in the writer's case, was the recital upon the great organ in Sage Chapel. Here was music which many can hear but rarely in a lifetime. It is to the credit of Cornell University that departments other than the agricultural offer some of their best things to visitors on Farmers' Week. M. B. DEAN.

THE STORY OF A CO-OPERATIVE SUCCESS.

PART IV.

A LAND BANK.—To-day, in New York State, we have to borrow money from men who must have it repaid in a lump, and who either cannot or will not grant, as the case may be, any but the shortest terms. Their money must come back to them ready for reinvestment, which precludes payments spread over a term of years. In France and Germany they have systems of land bonds guaranteed by that same joint credit that has helped our Exchange. These bonds bear a certain interest, in addition to which those for whom they are issued pay yearly an additional one or two per cent toward their redemption, which is charged off the debt. In brief, the system is a central land bank whose members are associations in many communities. Any member of an association may apply to it for a loan. The application is passed upon by the association to which the applicant belongs, men thoroughly familiar with local conditions. It is then passed to the central organization, which offers the bond for sale. Guaranteed by the joint credit of the whole system, such bonds rank with the best government bonds as investment securities and are in steady demand. Those bonds run for long terms of years—40 years being common.

PROPOSED LEGISLATION.—Last year a bill was passed by the Assembly, and reached its third reading in the Senate, to enable us to do that very thing. This year a similar bill will be introduced under the auspices of the new Banking Commission, with every chance in its favor, and it will pass if each and all of us does his share toward pushing it. And this bill is based on proven coöperative principles, proven not only in France and Germany by a hundred years of experience, but proven right here in New York by the many flourishing savings and loan associations. These have devoted themselves to local city and suburban needs. The proposed bill will unite them all and open the door for rural associations to come into a tremendously strong joint credit plan, whose bonds will be as steady, reliable, investment securities as any government bond, because backed by that form of security which cannot run away and can only increase in value as time goes on. When once the land bank is established there is no reason why our growing Exchange should not look forward to membership in it, and our members be freed from the tyranny of private money lenders or the short term note which is all our banks can give us. We look forward to that end as one form of future activity, and we have learned that it is possible by actual experience in our Exchange work. But first of all each community must make its little start as we are doing and take its lessons in working together, giving and taking, living and letting live, for that is what coöperation means. Some will never learn the lesson (we have some) and they will have to be weeded out or left out

Now, I haven't read this paper to preach an ideal, nor have I read it to advertise our Exchange. I have read it to show how we are trying to make more money than before by cutting out the middleman where we are consumers, and to find better ways of marketing, that we may get more than a 35-cent dollar. It seems to us that there is a big field for work between Exchanges. Many here must produce things that we need to buy. We produce things you want to buy. By dealing direct I am inclined to think we could do much business to mutual advantage, and our Exchange would be more than glad to hear from others or individuals along these lines.

NEW YORK STATE NEWS.

GRAPE GROWERS MEET.—At a recent meeting of the Chautauqua and Lake Erie Fruit Growers' Association at Ripley, the proposition was endorsed to organize the owners of a majority acreage of the grape-bearing land of the belt into a coöperative association. Addresses were made by Prof. J. F. Barker of Geneva, F. Z. Hartzell and F. E. Gladwin of Fredonia, S. J. Cook and H. B. Rogers. Dr. Jordan of the Experiment Station was thanked for his interest in the growers of the belt.

ABOLISHING COUNTY FINANCIAL GOVERNMENT.—Lewis K. Rockfeller, chief of the Bureau of Municipal Accounts of the Comptroller's office, advocated the abolishment of the present system of county financial government, since it permits of so many irregular and illegal practices. He is reported as saying that either the boards of supervisors should be abolished or that they should be permitted to exercise only legislative functions. He says that when the present bureau was organized they found about as many systems, or lack of systems, as there were counties. Out of 57 counties visited there were about 57 varieties of bookkeeping, and in only four were there found methods worthy favorable comment.

VIOLATIONS OF THE CONSERVATION LAW.—A bill has been introduced in the Asesmbly by Mr. Mackey which would amend the conservation law by providing that an action for penalties for violation of the law must be brought in the town where the penalty is incurred or in which the defendant resides, or in a town adjoining that in which he resides. At present the action may be brought in any town in the county in which the penalty is incurred, or if the defendant resides in another county then in any town in the county in which he resides.

ONONDAGA FARM BUREAU.—About 100 farmers and others interested in the work of the Farm Bureau met in annual session at Syracuse, February 21. Much enthusiasm was manifested in the work and 24 new members were added. E. A. Powell was elected president of the association; W. C. Hunt of Fayetteville, vice-president; W. W. Porter, secretary, and J. T. Roberts treasurer; S. A. Martin, agriculturist. M. C. Burritt was present and addressed the meeting. An advisory council was formed, one member being from each town in the county. Plans for the work for the present season were discussed, and it was decided to ask the board of supervisors to increase their appropriation this year over that of last year, which was $1,000.

PEACH BUDS HIT.—It seems beyond question from all reports that the peach buds in Western New York, and possibly in other sections, for the cold has been general, have been badly injured by the cold weather. In sections where buds are usually immune they are found to be injured.

FACTORY MANAGERS' COURSE.—The department of dairy industry at Cornell will offer a week's course for the managers of dairy plants, where they may become familiar with the latest methods. Each person attending will be allowed to specialize in that branch of the work in which he is most interested. The requirement for admission is that the applicant must have had at least one year's experience as manager of a factory or creamery. The fee for the course is $5, and the course begins March 11.

EFFICIENCY IN FARM MANAGEMENT.—This was the theme of County Agent Robertson at the farm extension school at Adams. He showed that the average farm in Jefferson County comprised 143 acres, and the number tilled as 70. The average income of the farmers was $609. Of the 670 farmers visited by the agent, 74 made less than $1 for the year's labor or lost money; 247 made between $1 and $500; 204 made between $500 and $1,000; 99 made between $1,000 and $1,500; 29 between $1,500 and $2,000; and only 17 made over $2,000. The large farms made more money than the small ones.

AGRICULTURAL SOCIETIES' BILL.—A bill has been introduced in the Legislature by Assemblyman Chase of Greene County which provides that any agricultural or horticultural society which has been incoroprated under the laws of the State for a period of 25 years or more, and which has during that time held 24 or more exhibitions of farm produce of all nature, upon which cash premiums have been paid, shall be entitled to a share of the money which the State gives to agricultural and horticultural societies. J. W. D.

FRUIT GROWERS AT POUGHKEEPSIE.

The Eastern Meeting of The N. Y. State Fruit Growers Association has become an index that accurately records the progress made by the fruit growers of the Hudson Valley. Despite the bad roads and stormy weather the hall was crowded and the interest is such that it was voted to hold a three day meeting next year.

Professor Morrell's address referred mainly to grading and packing fruit, and before the close of the meeting a resolution endorsing the grading and packing bill now before the State Legislature was adopted.

Prof. Hedrick, of Geneva, spoke on "Ten Years Profit from an Apple Orchard," which gave an accurate account of all expenses and income for a 10-year period.

Dr. E. P. Felt, State Entomologist, speaker on "Insects in the Hudson Valley," said a San José scale parasite had been found quite abundant in the Hudson Valley and while it was doing much to check the scale, fruit growers were not warranted in neglecting their usual fight against this pest and should be as vigilant as ever

J. R. Cornell, of Newburg, spoke on "Pear Growing." He practices intensive culture and is constantly on the lookout for the appearance of blight, cutting it out at the earliest possible moment its appearance can be discovered.

Orlando Harrison, of Berlin, Maryland, told how they saved their peach crop from brown rot by thorough and timely spraying and during his talk told of their experience with college boys as help. Many condemn this class of help because some of the boys are practically worthless or worse but it they would only stop to consider they would find other classes of help as a whole no better.

In spite of the fact that the menu cards were lost in the storm by the express company and that most of the scheduled speakers were unable to attend, the banquet was as usual a great success. The Hope Farm man in a short talk tried to impress his hearers with the fact that the fruit grower who won honor for his section by growing prize winning fruit should be honored by the home folk as the victorious athlete or warrior is unusually welcomed home. The key to his talk was that the fruit grower or farmer to win happiness and contentment with success must have "joy in his job." That he struck a sympathetic chord in this was shown by reference to this point by all the following speakers

The surprise of the evening was given by Mr. Schule, the grape juice manufaeturer and he kept the audience in a continual state of merriment. Dr. Butler of Poughkeepsie kept up this merriment and the banquet broke up without that tired feling that often follows long dry talks after a hearty meal.

In point of average quality it is doubtful if the fruit exhibit has ever been equaled in New York State and the fruit growers of the Hudson Valley ean feel justly proud not only of the plate exhibit but of the box exhibit as well. Baldwin, Greening, Northern Spy, King, Yellow Newtown, McIntosh and Lady Sweet were especially strong among the older varieties, while the most prominent among the newer varieties were Jonathan, Wagener, Stark, Rome, and Winter Banana. The Geneva Station made a handsome exhibit of many varieties in box faees and Messrs. Howe and Tubergen of that station judged the closely contested plate exhibits in a way that did credit to themselves and satisfied most of the exhibitors. Mr. W. S. Teator judged the box exhibits and most of the boxes scored very high both in packing and in fruit. New York fruit graded and packed as were the boxes at Poughkeepsie would drive the Western fruit out of the market as it has quality as well as appearance. Will *you* do *your* part to help New York gain a packing reputation? G. R. S.

NEW YORK STATE GRANGE.

PART III.

The trespassing by hunters on farm lands without the permission of the owner came up in a resolution for discussion, and while there was general unanimity on the point that hunters should obtain permission the question as to whether that permission should be in writing or verbal, caused lively debate by several delegates. Vote being taken those favoring a written consent were found to be in a majority. In the matter of kindness to dumb animals, a resolution emanating from Jefferson County asked that the time limit for confinement of stock in course of transportation on railroads be extended from 24 to 28 hours, which is the regulation in interstate transportation, without unloading for rest or feeding, exeept under certain unavoidable conditions. It was argued that stock was more comfortable on the cars than when unloaded (is the argument a good one?) and that the additional four hours would land the stock in New York city without unloading.

The McKellar bills now before Congress relative to the cold storage of food products were opposed in so far as they relate to fruit, which it was asked that the bill exempt, and that the limits for other farm products should be fixed on a reasonable and healthful basis, allowing restorage at any time or place within such time limits, but forbidding restorage for the purpose of extending or evading the time limit|" A large number of other resolutions were aeted upon during the last two days of the session and we attempt mention of a few only at this time.

Almost the last discussion of the session related to the State's appropriating money for other colleges or schools of forestry than that at Cornell, and the friends of Cornell were in the majority, thus adopting the resolution under discussion. Invitations were received from four cities for the next annual meeting of the Grange, these being Oneonta, Oswego, Binghamton and Malone. The executive committee will decide on place later. J. W. D.

Woman and the Home

From Day to Day

THE WEST WIND.

It's a warm wind, the west wind, full of birds' cries;
I never hear the west wind but tears are in my eyes.
For it comes from the west lands, the old brown hills,
And April's in the west wind, and daffodils.

It's a fine land, the west land, for hearts as tired as mine;
Apple orchards blossom there, and the air's like wine.
There is cool green grass there, where men may lie at rest,
And the thrushes are in song there, fluting from the nest.

"Will ye not come home, brother? ye have been long away,
It's April, and blossom time, and white is the may;
And bright is the sun, brother, and warm is the rain—
Will ye not come home, brother, home to us again?

"The young corn is green, brother, where the rabbits run,
It's blue sky and white clouds, and warm rain and sun.
It's song to a man's soul, brother, fire to a man's brain,
To hear the wild bees and see the merry Spring again.

"Larks are singing in the west, brother, above the green wheat,
So will ye not come home, brother, and rest your tired feet?
I've a balm for bruised hearts, brother, sleep for aching eyes,"
Says the warm wind, the west wind, full of birds' cries.

It's the white road westward is the road I must tread.
To the green grass, the cool grass, and rest for heart and head,
To the violets and the warm hearts and the thrushes' song,
In the fine land, the west land, the land where I belong.

—John Masefield.

*

SOME of our readers may be puzzled by one little phrase in the poem given above:

"It's April, and blossom time, and white is the may."

The reference here made is to the blossoming hawthorn of English hedges, which is commonly called "may" in many districts.

*

Two flower seeds you should not omit to order this year are dwarf snapdragons and dwarf single Dahlias. You may start seeds of both indoors about the middle of March, and also sow them outside after danger of frost is past. The snapdragons will demand moisture, and will endure slight shade. Both will give abundant flowers for cutting during a long period.

*

As we write our garden in Northern New Jersey is piled high with snowdrifts, but the house is gay with flowers—Dutch hyacinths and Parrot tulips. These were potted last October, kept in a cool part of the cellar until they made plenty of roots, and then brought into the living room as desired. If one's experience of tulips is confined to the more ordinary types, by all means get the Parrot or Dragon forms, and learn how wonderful these flowers are, with their slashed and frilled petals splashed with gorgeous color. According to our experience they are the very easiest of all tulips to bloom in the house in Winter.

*

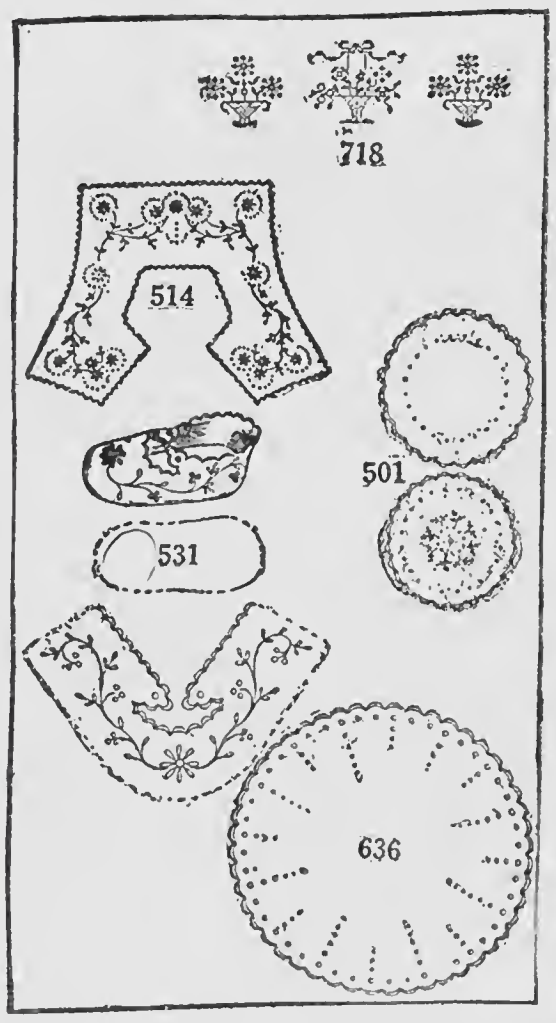
WHEN modern plumbing is a recent addition to an old house, it sometimes appears rather a mystery to the housekeeper unaccustomed to it. It should be studied by the women of the house as well as the men, so that they understand the location of the system, and are prepared for any emergency arising from it. It is very necessary that there should be a shut-off not merely where the water enters the house, but also so that separate sections of the supply may be cut off individually. For example, the laundry tubs are usually more exposed than the kitchen sink, and there should be a separate cut-off for them, so that their supply pipes may be free from water in freezing weather, without interfering with the main supply. Unless a frozen water pipe is in very bad condition, it can usually be thawed out quickly with hot water. Stand a pail of hot water under the stoppage if possible, and keep applying hot cloths, fished right out of the boiling water, and dropped in again as quickly as they cool off, keeping the water very hot. Of course a bad freeze means a leaky pipe. Trying to thaw out a pipe with a lamp or candle is not only futile, but may damage a lead pipe seriously—hot water is the plumber's first aid to the injured.

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired.

8169—Fancy waist with tunic, 34 to 42 bust. 8157—Surplice blouse for

misses and small women, 16 and 18 years. 8150—Semi-princess dress for misses and small women, 16 and 18 years. With two-piece skirt, with or without sleeves in full or three-quarter length, with or without tunic and chemisette. 8163—Semi-princess gown, 34 to 42 bust. With two-piece skirt, long or three-quarter sleeves. 8160 — Semi-princesse dress for misses and small



women. 16 and 18 years. With one-piece skirt, long or three-quarter sleeves, with or without revers, collar and cuffs. Price of each pattern, 10 cents.

The embroidery designs at prices given include materials for working; separate transfer patterns alone may be obtained for 10 cents each.

No. 718—Design for embroidering baskets of flowers in cross stitch style on guest towels, 24x15 inches. Stamped on superfine pure linen, with mercerized floss to work, 55 cents.

No. 514—Design for embroidering a square collar. Stamped on pure Irish linen with mercerized floss to work, 25 cents.

No. 501—Design for embroidering the covers for a circular pincushion five inches in diameter. Stamped on white linen lawn, with mercerized floss to work, 25 cents.

No. 531—Design for embroidering infant's shoes. Two complete shoes are given. Stamped on best round thread linen with mercerized floss to work, 25 cents.

No. 636—Design for embroidering a centerpiece, 22 inches in diameter. Stamped on best round thread linen with mercerized floss to work, 55 cents.

Light Bread Doughnuts.

If you have never made yeast doughnuts, be sure to try this recipe. One cup liquid yeast, one cup mashed potato, two-thirds cup sugar, one egg, one tablespoon shortening, flour to make a stiff batter, flavoring to suit taste. Beat the egg, add yeast, potato, sugar, shortening and enough flour to beat well. Beat long and hard. Add flour until the batter is stiff as you can stir it Let stand over night. Knead well in the morning. Let rise to about twice its own bulk. Roll to about one-half inch in thickness, cut out, stand on or in the warming oven until very light. Fry in hot fat. (I prefer part lard and suet or lard and cottolene). Roll in powdered or fine granulated sugar. This can best be done by putting some sugar in a paper bag, place in three or four warm doughnuts and shake. E. M. C.

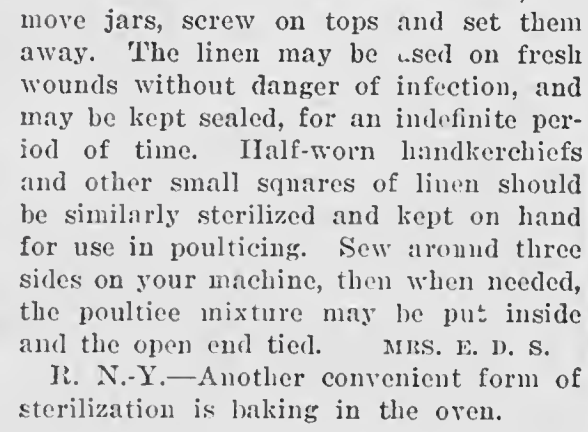
A Necessity in the Home.

Sterilized linen is a very necessary thing in the sick-room, especially in surgical cases. This may be impossible to obtain in emergencies, hence it is well to know how to prepare it at home.

Cut pieces of soft old linen into strips two to three inches wide, lap one end over another and sew across twice. Cut off all ravelings, then roll into a tight, smooth roll just large enough to slip into the mouth of a fruit jar. Fill jars full of these rolls and stuff the tops with absorbent cotton. Set the jars on a flatiron stand in a deep kettle, and fill with cold water up to the necks. Bring almost to a boil, keeping the water at about 180 degrees Fahr. for three to four hours. The water should not enter the jars, the steam being sufficient for sterilization. Let stand until cool, remove jars, screw on tops and set them away. The linen may be used on fresh wounds without danger of infection, and may be kept sealed, for an indefinite period of time. Half-worn handkerchiefs and other small squares of linen should be similarly sterilized and kept on hand for use in poulticing. Sew around three sides on your machine, then when needed, the poultice mixture may be put inside and the open end tied. MRS. E. D. S.

R. N.-Y.—Another convenient form of sterilization is baking in the oven.

EGGS FOR INVALIDS.—Drop an egg in a cup, and set the cup in a small vessel of boiling water, allowing it to cook "rare." This can be digested by the weakest stomach. No seasoning nor butter should be added while the egg is cooking. C. C. H. G.



Plaster walls and ceilings are only one step ahead of the mud hut. They bring damp, dust, disease, expense. Bishopric Wall Board costs far less, goes on dry, and takes any scheme of decoration that plaster will take. One man can apply it just as it comes—in strong, handy sheets.
Best also for walling bins, barns, and outhouses. Heavy coat of Asphalt-Mastic makes it insect-proof, wind-proof, weather-proof.

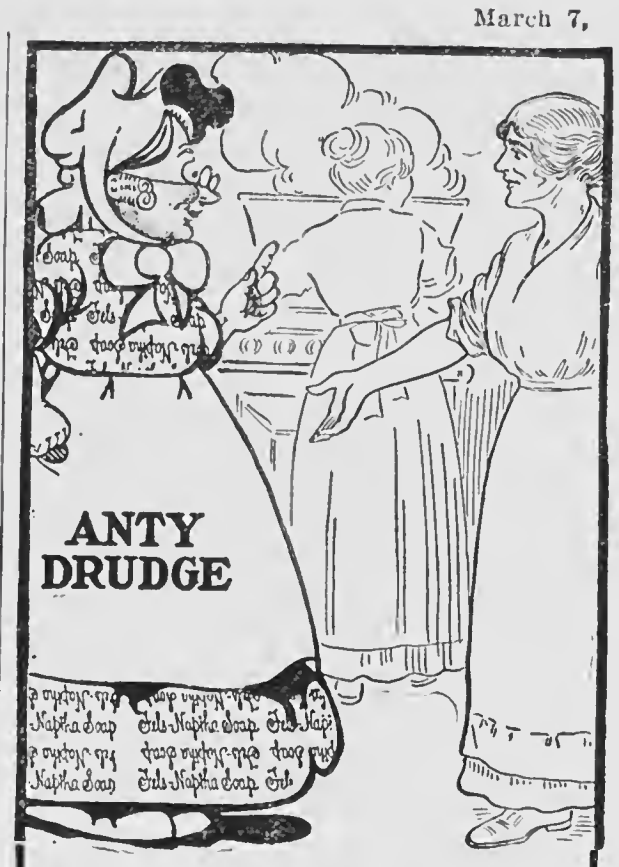
BISHOPRIC WALL BOARD

Is the only wall board made with lath. We own patents. Cannot crack, warp, buckle or pull loose. Saves half the time and half the cost of building walls, and makes them *better*.

ALL SENT FREE

Write for free book, model house plans and sample of Wall Board. They are money savers. (142)

The Mastic Wall Board & Roofing Co.
511 Este Avenue Cincinnati, Ohio



Mrs. Disagree—"Anty Drudge, what's this nonsense you told Mary about not boiling clothes? The idea of these young things telling their mothers how to wash! I settled her!"

Anty Drudge—"Well, you can't settle *me*, because I'm old enough to have some sense—so's Mary, for that matter. She's a sight more sensible than her mother about some things! I told her about Fels-Naptha Soap and how easy it makes work."

Don't boil your clothes. Don't waste time and strength rubbing up and down on a washboard.

Use Fels-Naptha Soap and cool or lukewarm water. Soak the clothes for 30 minutes while you do your chores. Then rub lightly, rinse and hang on the line. They'll be sweeter, whiter and cleaner than ever before, with less than half the bother, and in less than half the time.

Fels-Naptha does *all* your housework just as easily and well.

Better buy it by the box or carton. Directions are on the red and green wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

In My Neighbors' Gardens.—Dahlias.

One much-enjoyed forenoon in September was spent seeing what the Dahlia growers for several miles about were producing in the way of exhibition specimens. It was the boast of the Horticultural Society that 15,000 individual flowers were shown, so of course my "neighborhood" was a wide one and included well-known Dahlia specialists, local professional florists and many exhibitors classed as amateurs. This grand Autumn flower has been brought to a state of development which makes one with any gardening enthusiasm almost unable to decide which is loveliest, the fantastically twisted, tubular-petaled cactus sorts, the quilled and ball-like "show" types, or the "decoratives" with petals broad and flat, and individual flowers often measuring six inches across. Indeed one prize-taker, a clear, lovely pink named Bertha Von Suttner, was a full eight inches in diameter. And just when one has settled it that one of these shall have the heart, the eye falls upon an array of singles, and immediately every sort of double flower seems outdone by the satiny picturesqueness of this airy and wholly delightful and artless variety. The degree to which the petals of a Dahlia flower can be bred to grow rolled up and twisted, or flat and wide is astonishing. The grand "decoratives" spread their petals in rosette arrangement so little pleated as to suggest some other flower than a Dahlia, though it is hard to think of any other blossom to which they may be compared. This gives their beauty of heavy satin texture and depth of color striking effect.

Whether or not the velvety richness of the new types outdoes our old-fashioned garden sorts, certainly colors have made gorgeous improvements. Scarcely a crimson or dull pink was shown, I think, but the range from clear rose pink to deepest maroon, through all sorts of scarlet, Jacqueminot and carmine was a revelation. The heavy satin of the whites made them sumptuous, but most attractive of all, to me, were the yellows, running into apricot and burnt orange. Here and there was a deep amber which made all the reds and pinks seem outdone.

Of many odd and interesting types it is enough to mention the green Dahlia, Viridiflora, looking in size, form and shape of petals more like an Aster, but having Dahlia leaves. It was as clear a green as if made of sepals, but they were not Dahlia sepals. As but one flower was shown I concluded that it is a shy bloomer and not worth while for any except those who have means for testing it without neglect of more rewarding varieties.

And did I go home from this flower exhibition resolved to let all my own Dahlias, commonplace, unimproved old sorts, freeze and perish? No. At the show I had also seen the men who grew grand Dahlias, a practical, business-looking type of men, evidently capable of spending almost any amount of pains and resources. I realized that thousands of the blossoms shown had been each the only flower allowed to grow upon a plant, and that thousands more had been produced in the same exclusive fashion that these, the best of the output, might go to the exhibitor's tables.

A few days after the exhibition I chanced to visit the garden of an ordinary Dahlia amateur. It was a city lot with stable in the rear, and I know that the owner had time, enthusiasm and, keeping one horse and a few fowls, had also plenty of fertilizer to spread upon his borders. He had perhaps 40 Dahlias, scarcely two alike. Many were seedlings, a few were named sorts. All were interesting, but none near exhibition standards. The singles ran to doubles, and the doubles failed of reaching the "decorative" type. The "show" varieties held their characteristics better, but were merely ordinary. One or two plants were well filled with flowers, but on the whole, blossoms were scattering, yet he had picked none.

While I felt no wish to disparage this man's Dahlias it will be seen how much there was in his garden to make me willing to leave the growing of grand Dahlias to experts. Another lesson learned of this garden was to nip off side shoots and keep the plants to one stalk.

PRUDENCE PRIMROSE.

Flowers After Frost.

As the sun mounts northward and the days lengthen, our desire for a garden and the pleasures of gardening are reawakened. During the short days of Winter this desire has been hibernating, but as the sunshine lingers, bringing forth the snowdrops and the robin, we find it has put off its Winter sleep and is fully awake. Here are the catalogues, replete with all that goes to make a Summer, but it remains to us to plant with a memory of past denuded gardens, when the first frost took all of the glory, leaving to us only blackened beds and empty vases. With a little forethought at the planting time we may select varieties whose season is long, and also of sufficient hardihood to withstand our earliest frosts, coming like a benediction at the end of a full Summer and a plentiful harvest. When the tender flowers are gone how pleased we are to prolong the season still further with some less delicate, but still beautiful blooms.

First we would choose Verbenas. The seed is slow of germination, but will come very soon, when it is possible to supply bottom heat. If planted only for Fall blooming it will do very well scattered in the open ground. They transplant easily, and started early, will bloom through the hottest weather, and on into the cool days of Autumn. Never gather Verbena blooms in the heat of the day, or you will only have a mass of withered leaves and flowers. Gathered early in the morning, still wet with dew, or after the sun has dipped below the western hills, they will not disappoint you. Their habit of rooting from the procumbent stems gives them a much longer blooming season. Petunias stand high in the list of frost resistants. A killing frost may take the open flowers, but the buds will open in the bright sunny days that always follow in the wake of a frost. The bedding varieties are perhaps the most satisfactory for the purpose.

Annual Phlox is another that blooms over a long period, and if kept from seeding will give plenty of bouquets after sweet peas and Dahlias have yielded up their lives to King Frost. These will repay a liberal mulch, as the beating Autumn storms cover the delicate blossoms with sand. The rain and the cooler weather seems to lighten their colors and also to increase the size of individual blooms, giving a better and brighter spray of bloom with a sweet and delicate perfume.

Pansies will join hands with the snow storms of December, defying Winter, and blooming again in early Spring to cheer the days before the tender annuals develope. Sweet Alyssum, that old favorite of the garden, is bravely blooming while we are setting out the bulbs for Spring blooming. We are loth to destroy it, so lift it to a pot and place it in a sunny window. If not kept too warm it makes a very satisfactory window plant. Then there is mignonette, like a true friend, constant till the last. You will find it beloved of the bees on sunny afternoons. Calendula, as its name implies, shines out on nearly all of our calendar months. At the north, when actual Winter comes it must succumb, but its golden and paler yellow hold their place long after severe freezing. Shakespeare called it "Marygold" but the marigold of our catalogues is one of the first to fall a victim to the frost.

Annual Chrysanthemums also give yellow blooms till Winter is here to stay. These come also in white with finely-cut foliage and densely double. Perhaps the best of Fall bloomers is the hardy Chrysanthemum which will endure, year after year, in the open ground, but always blooms late, while the above mentioned annuals bloom from early Summer on into the melancholy days.

Among plants seldom seen is the larkspur. This is a beautiful, late bloomer being entirely frost-proof. The foliage is lacy, the blossoms of the double class being very like hyacinths. In habit, either tall or dwarf, as your fancy dictates, coming in colors best represented by our flag—red, white and blue. One feature of these frost-resisting beauties is their habit of self sowing. The vitality that carries the blossoms so late, is transmitted to the seed, and will gladden your eyes the second season, with no effort or expense on your part.

The Coming of the Seed Catalogues.

"I'm not going to have much of a garden this year."

"You are not?" This last with surprise and some dismay.

"No, I am not." At the note of decision in these words the husbandman looked alarmed—and with reason. That I should thus deliver myself—most enthusiastic and indefatigable of gardeners—was indeed alarming, even to myself. In more senses than one, what would we do for a living? For besides being the mainstay of our table, the garden work was a recreation too, and sometimes a door of escape that I could hardly afford to have closed.

"Oh, you'll feel better about it before long," was the hopeful suggestion finally. But I thought not. The last Summer had been a hard one, and I had overdone the gardening. It was too much—with the housework, the little children and all—I couldn't afford to wear myself out in that way another Summer. Thus I reasoned gloomily. And here it was January, whose forward looking face had hitherto been the one it turned to us and in other years with the garden zest awakening fresh and ready for the Spring. And here was I remembering chiefly the weariness of the Summer that was past, and shrinking from all thought of a garden. Even the appearance of the seed catalogues—usually received with acclamations and accorded the place of honor in the living room—aroused no interest. It looked as though there would not be, this year, that delightful evening with paper, pencil and "list." You know the sort of evening—no matter if you order identically the same things one year as the year before and the year before that, you do it with the same eager study and comparison of the new varieties and the old, the same earnest "Would you get two packets of this?" and "Won't we need another pint of that?" Just as when we greet the blossoming of the apple trees it is with ever fresh wonder, as though the same thing did not occur every Spring of our lives.

One day we received the catalogue which had always been the one at my old home. I had not seen it for several years, and it brought to mind now the little flower-gardens of many Summers and, above all, my very first one. I can see it yet, a narrow strip by the front fence of a city yard. Phlox, Petunias, candytuft, sweet Alyssum—these were the flowers my mother planted in that little garden for me, and though they are not my favorites to-day, by any means, there is about them, even in the very sound of their names, an indescribable charm, the magic that lingers about the memory of so many "first" things. Perhaps there is some of that same magic in the old-time catalogue, dressed in modern fashion though it is—the "odorous" echo of a score of dead Summers" evoked by the familiar name of it. At any rate, something stirred in me and wakened at the touch, the doubts and fears which had been clouding my horizon vanished as by magic, and there was, after all, that annual event, the evening when we made out our seed order!

"When Winter seems most like to Death,
So cold it is, so still and bare,
There comes under the sky a breath,
Winter grows wistful, life grows fair:
A perfume from the quickening earth,
A balmy waft in snowy air,
A thought, a hope of greening birth,
New life—and Spring is there!"

Apropos of the "greening birth" it might be well to remark here, that the next Summer's garden was the best we have ever had, though probably the smallest in amount of space included. By being planted more judiciously, with less at one time but with greater regard for an unbroken succession through the season of vegetables that we knew we should want to use constantly, the garden reached a high degree of efficiency with a minimum of time and strength bestowed upon it.

In spite of the necessity for economy in these ways, one of our gardening rules is to try every year in both the vegetable and flower gardens at least one thing that is new to us. Last year it was English marrow in place of our usual Summer squash, and Japanese Iris, and in both cases we were paid a high rate of interest. One year it was lavender, and for two Christmases now the sewing into little bags of the Summer's crop of lavender flowers has been among the most enjoyable of my holiday preparations, while the friends who received them were delighted with the old-fashioned fragrance.

This trying of new things we find adds immeasurably to the interest and enjoyment of our work. The ability to wonder, to have in our daily lives an eager interest in something that is new in them, though a special prerogative of youth, is not impossible to any of us, and is an invaluable help in lightening the burdens and brightening the aspect of those same daily lives. H. B. T.

Pot-pourri for Rose Jar.

Can you give me a recipe for making an old-fashioned rose jar? In these days of awakened interest in gardens, I note also a revival and the disposition to preserve the sweet odors. A. B. P.

The following directions were given by an Oregon correspondent last year:

Gather the petals in the morning after the sun has dried the dew; for rose petals absorb rain and dew like so many silken sponges. Pull the petals from the calyx and scatter them over a piece of thin cheesecloth or mosquito net that has been tacked to a frame so it hangs loosely. Suspend the frame on a porch or in a dry room, where the air can reach the petals from all sides. If you wish to get best results do not let the sun get to them. Keep spread out as much as possible and stir quite often. When the petals curl they are dry. The next step is to "salt down" the petals. Get the driest salt you can. Bay salt is best and Liverpool table-salt next, but if these are not convenient, dry the best table-salt you have in the oven, roll or grind it fine and put in a coarse shaker. Put a layer of petals in a glass fruit or candy jar or a covered stone jar and sprinkle quite liberally with the salt, another layer of petals and more salt, keep adding layers of petals as you dry them and the salt. The salt is to absorb any moisture which may not have been dried out. Stir the mass well each time before adding more petals. The petals after a week or so in the salt, may be taken from the jar, the loose salt well shaken out and be used to fill rose pillows or may be packed in a permanent rose jar and kept covered for a month or more, then, when the lid is removed, it will emit a delicate rose perfume. But if you wish to make potpourri, the preparations are somewhat more elaborate. Besides the petals of the roses, dry pinks, carnations, leaves of rose geranium, lemon verbena, rosemary, lavender, in fact any spicy or sweet-smelling plant that retains its fragrance when dried. The ordinary potpourri smells too strongly of spices, so have a care as to how you use them. To six quarts of the dried petals and leaves use one-fourth of an ounce each of mace, cloves, cinnamon and allspice ground very coarse, so the oil will not all evaporate so quickly. To these add one ounce each of gum benzoin pounded coarse and of orris root chipped, a little dried and pulverized orange and lemon peel, also some sandalwood sawdust, if you can get it, and some powdered gum myrrh. Mix all these ingredients well and the mass is ready to be packed into the rose jar. In the bottom of the jar put a few drops of oil of roses and a grain of musk and shake well, then pack in and press down the fragrant mixture. About every four inches pour in some of the best bay rum, scented with wild orange, just enough to moisten the mass a little but not wet it. When you can crowd no more into the jar cover closely and leave for three months without opening, so the perfumes may blend and work upon each other."

Some directions advise salting the petals as soon as they are gathered, without the preliminary drying, but this has always caused molding in our experience. The quantity and variety of spices may be varied to suit personal taste.

We have not wings, we can not soar;
But we have feet to scale and climb
By slow degrees, by more and more,
The cloudy summits of our time.
The heights by great men reached and kept
Were not attained by sudden flight,
But they, while their companions slept,
Were toiling upward in the night.
—Longfellow.

My Garden Plans and How they Worked Out.

I had planned for a bit of a garden for my very own, near the house, so I could work there any time I wanted to, even if I had no more than five minutes to spare. It was to be about 20 by 30 feet and I had laid it out in my mind half in sweet peas and pansies, and half in early vegetables. Then I thought I would put in some hills of Brandywine strawberries three feet apart each way, planting these between rows, so that next year my garden would be my strawberry patch. Besides I wanted a dozen of the the Columbian blue-red raspberry plants started here, which I hoped by the third year would be bearing and I would have near at hand, the material for making the delicious raspberry jam which this fruit seems to be especially fitted for. It isn't a good market berry, for its purplish dull color is not attractive, but it is a wonderfully prolific bearer and makes a fragrant jam, superior to the red fruit. These "three-story" plans might have worked out well under favorable conditions. How they did work out was a little discouraging. However, I got a good deal of pleasure out of the work and have enthusiasm enough left to try again this year.

The first work I did in my garden was on April 10, three days after plowing. I set out a row of big sprouted onions left over in the cellar. These were "hoed" by three-year-old Baby John when I didn't know it, evidently, but enough were left in the ground to give us several messes of "green onions." About the fifteenth I had spaded up for me a bit of ground which joined my garden spot, where a good deal of waste water was thrown out. The plowing and spading were all the work which I did not do myself. Here I planted sunflowers which made an amazing growth. In a short time they were like a miniature forest. I kept the earth loose about their roots, and later, in the hot dry Summer, took pains to empty all the wash water there. They performed their mission well of keeping this bit of waste ground sweet, wholesome and sightly.

I paid out but 45 cents for seeds and planted as follows: Sweet peas, 10 cents; lettuce, five cents; American Wonder peas, 10 cents, and 20 cents for 40 strawberry plants. The sunflower seed, some pansy plants and geranium slips were given to me, shared by neighbors. I found I had planted my sunflower seeds too thick and had to weed out more than half. These plants I gave away and they were transplanted and grew nearly equal to my own.

The sweet peas I soaked over night and carefully planted, three in a place, a foot apart in rows about 18 inches wide. It seemed as if every seed grew. I put brush for them to run over and some wire netting, the simplest and easiest way, for I had little time to spend. Soon they were a mass of glowing color, a pretty sight. They covered nearly one half the garden space and with the pansies and geraniums, which, however, on account of the hot dry season, yielded only a few blooms in late Summer, made a pleasant outlook from the dining room window, and on beyond was a field of grain, then the cedar-bordered shore, the river and Long Island. These peas seemed to be in all gradations of color, and the first blossoms were of large size. Such shadings of lavender and pink through the brightest carmine red and on to deepest wine, almost black, and fairy white ones and "painted ladies" and parti-colored blooms in bewildering profusion! I had "enough and to share." It really was a task, although a pleasant one, to pick them every other day.

The Summer was hot and dry. My strawberry plants, not too thrifty to start with, failed to make good. On account of the season I decided to wait until Fall to put in my Columbian berry plants, and ordered them to be delivered in October. We had some fine green peas several times and lettuce too, until one unlucky day the lambs discovered my garden, and very soon finished that half of it off. Fortunately the sweet peas were not to their taste. I threatened to have lamb chops for dinner, but as that would not restore my garden and was a good bit of work for me, I gave it up. There was no fence on the place that would keep in these lambs, who wandered around at will. However, we could fence in their mothers, and fortunately the lambs would not wander far away from them.

The Columbian raspberry plants arrived by parcel post in November in a snowstorm, and the ground here was frozen hard. I do not know why the plants were delayed. I wrote them I could not use them, and in reply received advice to set them out; if they did not live the nursery would replace the plants in the Spring. As I did not care to set the plants out in the hard frozen ground, I sent them back to the firm and agreed to take a dozen in place of them in the Spring.

Well, so much for my plans and the way they worked out. Farming plans often work out the same way; we do our work as well as we can, but the results are not often what we expect. Sometimes our plans work out better than we had hoped for. We learn by experience and can calculate pretty well on everything but the weather. I know one thing—I shall not allow any lambs to dine off my garden this year. The weather I'll try to put up with cheerfully. F. J. F. F.

Holiday Cake.

This cake is nice for parties or luncheons. It requires but two eggs, and will almost melt in your mouth if you follow directions carefully: Put one cup milk in a double boiler, heat to boiling point. Put one cup flour (no more), into a cake bowl; add one cup sugar, three teaspoonfuls baking powder; pinch of salt. Sift together four times. Have whites of two eggs beaten stiff and dry. Pour the cup of hot milk into the flour, sugar and baking powder and stir smooth. Add the eggs, but do not beat or stir hard, fold in by drawing the spoon through the mixture towards you, then shoving it back with the spoon. Next stir from right to left in the same way. Repeat this until the whites are evenly folded in. Put into a pan greased with fresh butter and bake. Have the oven cool at first, increasing the heat until the cake is well done. This fills a pan five by nine inches and three inches deep. A good icing for this cake is made as follows: White of one large egg beaten stiff; three tablespoonfuls granulated sugar; one teaspoonful cornstarch. Flavor with vanilla and put on the cake.

MRS. C. E. G.

Lard that Keeps.

H. M. B. will find this method of trying out lard satisfactory. Cut up the leaf in the old-fashioned way, or with the meat grinder. When it is put into the kettle (preferably an iron kettle) add a small quantity of water, also a little salt. Cook until the water has evaporated and the scraps are a golden brown. Stir frequently to prevent sticking and burning. Store in tin pails. Adding the small amount of salt when the water is put in, it distributes it through the lard. If the salt were added without the water it would settle at the bottom of the kettle and not season it. Cooking until the scraps are brown gives lard a fine fresh odor that is retained through the year. This rule has been used by one housekeeper in her farm home for more than 60 years. Often she has been asked "just how" she does it. The rough lard can be made almost as good as the leaf. It should be cut into small pieces, washed, then soaked over night in cold water, which should be changed once or twice. Then try it ont the same as leaf lard, but separate from the leaf, and always use the "rough lard" first. G. M. L.

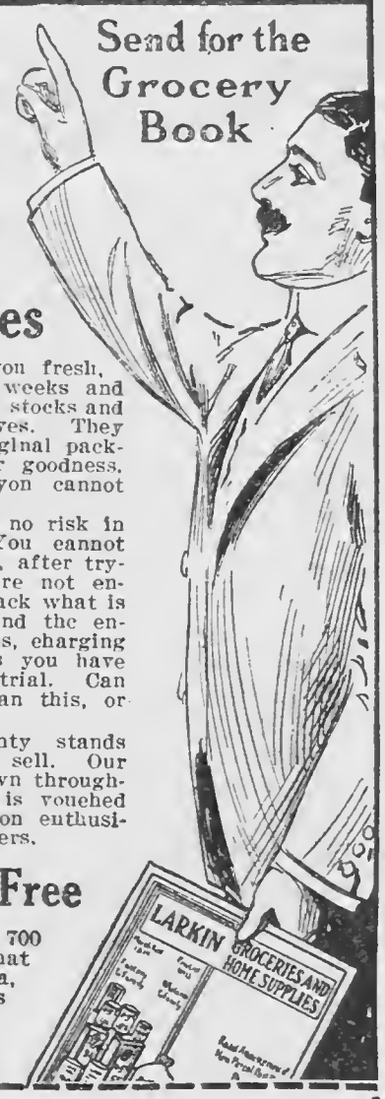
We cut lard in small pieces, and I start rendering without the use of water at all. I take about one gallon of lard and render and keep adding till kettle is full. I never had any lard to spoil yet, doing that way. C. F. M.

THERE is no talent so useful towards rising in the world, or which puts men more out of the reach of fortune, than the quality generally possessed by the dullest sort of men, and in common speech called discretion; a species of lower prudence, by the assistance of which people of the meanest intellects, without any other qualification, pass through the world in great tranquillity and with universal good treatment, neither giving nor taking offense.—Swift.

Save One-Third On Groceries

Live Better—Pay Less

No matter where you live you can save an average of one-third of your grocery expense! You can get fresh, pure groceries for 35 cents less on the dollar than you now pay! And you can do it easily, conveniently—with absolute certainty of satisfaction—by the popular Larkin Wholesale-to-Family Plan.



Groceries at Wholesale Prices

When the retailer buys groceries he pays wholesale prices, but to these prices he must add enough to pay his expenses and make a profit. This increased price is what you pay when you buy at retail. We save you this difference by selling you groceries at the prices the retailer pays. In other words, you save the middleman expense.

Just think what this saving will mean to you. The average family spends from $3 to $4 a week on such groceries as we offer. If we save you one-third of $3 each week it will mean a saving for you of $50 a year. Think of what $50 will buy! Is it not well worth saving? And if your family is a big one you will save even more.

The quality of our goods is the very best. They are made in clean, light, wholesome factories and are shipped to you fresh, without lingering weeks and months in wholesalers' stocks and on grocery-store shelves. They are shipped in the original packages to preserve their goodness. Better, purer foods you cannot buy.

You take absolutely no risk in ordering from us. You cannot lose even a penny. If, after trying our goods, you are not entirely satisfied, send back what is left and we will refund the entire amount you sent us, charging nothing for the goods you have used in making the trial. Can anything be fairer than this, or safer?

The Larkin Guaranty stands behind everything we sell. Our reputation is well known throughout this country and is vouched for by over two million enthusiastic, satisfied customers.

Book of Grocery Bargains—Sent Free

This valuable Book contains over 200 groceries and over 700 other articles of everyday household use—all at prices that will save you from 15 cts. to 50 cts. on every dollar. Tea, coffee, canned vegetables and fruits, baking powder, spices flavoring extracts, soaps, starch, hardware—these and hundreds of others are described and illustrated.

Send for this Book. It can save you hundreds of dollars. Send for it today. Begin your saving right NOW. Just fill in and mail the coupon or write a postal and we'll send the Book by return mail.

Live Stock and Dairy

Care of Young Bull.

I have purchased a young purebred bull. Now I want your advice as to the care of this bull. Should you advise having him dishorned at once? Is he young enough to be broken in harness, so that he will get proper exercise in that way? He will be a year old April 23.

G. G. H.

I would not advise the dishorning of this bull calf until he is about a year and a half old. It is important in the rearing of a dairy bull that he be given such a quantity of feed as will enable him to grow vigorously and regularly, and that care be exercised in the selection of the feed so that he may be able to get the proper nourishment without padding his body with undue flesh. The common practice of feeding the bull in the dairy herd the discarded or left-over feed that is cleaned up or swept out of the manger of the dairy herd is faulty inasmuch as there is bound to be irregularity in the amount and kind of food fed. A very useful grain mixture for a dairy bull

HANDLING THE COLT.

would be as follows: Crushed oats, five parts; wheat bran, five parts; distillery grains, five parts; buckwheat middlings, five parts; oil meal, one part; fed in such quantities as will keep the bull gaining steadily in weight and vigor without permitting him to put on flesh or surplus fat. If he gains 1½ pounds per day in weight, and at the same time evidences the thrift desired, he will develop into a well grown and useful bull.

He might be appropriately broken at one year of age and subjected to light work, or he may be used on a tread power if one is in use at the farm. If this is not practical he might receive his exercise by means of utilizing a trolley wire, which should be attached to two strong posts from which is extended a rope that could be fastened to the bull's halter. He must not under any circumstances be confined to a stall in the stable, as exercise and activity are absolutely essential if he is to develop into a useful and active bull. He may be safely used for service with a few cows when he is a year old, but excessive service while he is young surely limits his usefulness as he grows older, and is not a safe practice to follow. F. C. M.

Training a Saddle Horse.

I have a little mare of native stock, but sired by a well-bred horse of the carriage type; she is coming five, trimly built, and weighs, in good condition, 950 pounds. She has just been broken to drive and shows a very pleasant disposition, with a fair amount of life and nerve. Having no use for her on the farm, and not wishing to dispose of her at the price such horses bring, I would like to make a saddle and driving pony of her, for my own pleasure and that of my wife. I have handled horses and colts, from my youth up, but know nothing about training a horse to the proper gaits under the saddle. If practicable to give them in reasonable compass, I would like a few simple directions for breaking this mare to saddle in one or two of the essential gaits. She trots, but shows a tendency to pace, and canters with a very easy motion. Will using such a horse under the saddle materially interfere with her value as a driver?

B. D.

R. N.-Y.—We shall be glad to have our horsemen try their hand at this.

Why I Breed Jerseys.

Because they will produce more profit for the feed consumed than any other breed in the world. They are persistent milkers, giving a good flow of rich milk, and holding out well for 10 or 11 months of the year. The breed as a whole I think will compare very well as to the production of milk for a year with their distant cousin, the black and white. Because they are the handsomest cow on earth; some people say that the Jersey is delicate and their milk is too rich for their calves. Let me say that in my 25 years' experience in breeding Jerseys I have never lost a calf with scours, and I always leave the calf with the cow for four or five days after birth. The old chestnut that our black and white friends tell us, that the Jersey milk is too rich for babies and children, is all bosh. If any of them will send me a nice baby boy or girl, I will guarantee to raise it on Jersey milk right from the cow, testing from five to six percent butterfat.

New York. F. S. DELANO.

The Brown Swiss Cattle.

I have a chance to buy a young Brown Swiss heifer advantageously. Can you tell me whether that stock are good milk producers? J. A.

Middletown, N. J.

The Brown Swiss breed of dairy cattle is recognized as more of a dual-purpose breed than one strictly for milk production. Certain selected individuals of the breed have made noteworthy milk records, but if this inquirer is desirous of purchasing a dairy cow for the production of milk alone, it is very probable that representatives of the Holstein, Ayrshire, Guernsey or Jersey breed would serve his purpose to a better advantage. Representatives of the Brown Swiss breed are sturdy hardy and vigorous, yet they are deficient in udder development, and are not strictly intensive milk producers. F. C. M.

Appraising Sheep.

When sheep have been bitten and killed by dogs, should purebreds be appraised higher than grades? J. J. A.

New Jersey.

Appraisement should be based upon the actual value of the sheep killed, and if the purebred animal referred to was a high-class individual the only correct appraisement would be based upon the actual value of the individual. In most cases, however, where appropriations are made to repay damages resulting from such accidents, there is a maximum and minimum value fixed, and ordinarily a certain percentage is allowed for each individual. Naturally a purebred animal is worth more than a grade, and it would be only just to fix value upon a basis of individual merit. F. C. M.

Thick Cream

The advantages of thick cream over thin cream are many and very important.

Thick cream contains less milk, consequently, less souring elements and therefore will keep sweet longer.

Thick cream is less in bulk and therefore more easily and cheaply transported.

Thick cream causes less loss of butter fat in churning.

Thick cream leaves a greater quantity of the skim milk at home to feed to calves and pigs.

Thick cream brings a higher price—many creameries give from **two to five cents more** per pound for butter fat from thick cream than from thin cream.

At a demonstration of cream separators at the Iowa Agricultural College, January 8th, 1914, the

UNITED STATES CREAM SEPARATOR

separated cream that tested **47 per cent.** butter fat. The next nearest competitor tested **33 per cent.** butter fat and the second nearest tested **26 per cent.** butter fat.

The United States is the only separator that can separate thick cream and separate clean. Others, in attempting to equal it, clog or leave cream in the skim milk.

The United States Separator has a record of **65 per cent.** butter fat and made perfect separation, as shown by the skim milk test and holds

The World's Record for Close Skimming

in 50 consecutive tests run for 30 days with 10 different breeds of cows.

LONG-BODIED SWINE,

I wish to get a long-bodied type of hogs, either grade or registered. I understand these are the Yorkshire, Cheshire and Tamworth. Will you state how the different breeds are shaped? Which type would you recommend?

F. M.

Southport, Conn.

F. M. evidently refers to the bacon type of swine, the chief representative breeds being the large Yorkshire and Tamworth. The Yorkshire is characterized by what is known as the bulldog nose, the light jowl, the exceedingly long body with characteristic trimness throughout. They are particularly popular and useful in districts where by-products from the dairy are available for swine feeding, and where there is a market justifying the keeping of the bacon type of hog. They grow somewhat slower than representatives or the fat breeds, and have a carcass that possesses extensively marbled and prime meat. The Yorkshire are further noted for their prolificacy, producing large litters, as it is not unusual for a well-grown and carefully selected brood sow of this type to farrow from 14 to 16 pigs. They are not particularly adapted to pen feeding, neither do they respond to extensive grazing facilities.

The Tamworth breed is slightly larger than the Yorkshire, and vary in color from a cherry red to a dark, sandy, brownish color. They are inclined to be rather coarse about the head, with long nose and rather rough ears and coarse shoulders. They are unusually hardy, however, having great constitutions and consequently are very heavy feeders. They also produce large litters and are unusually quiet and attentive mothers. It is generally conceded, however, that the bacon hog is more exacting in his demands, and considerably slower in growth and maturity than representatives of such fat breeds as the Duroc Jersey, Chester White, Berkshire or Poland China, and unless there is a special market for cured meats in his section it is very probable that F. M. will have better results if he selects representatives of the fat breeds for his use. We have representatives of all types at the New Jersey Experiment Station, or they may be seen at any of the county or districts fairs. F. C. M.

Reindeer in Alaska.

Alaska is having a remarkable breeding problem with the reindeer. There are about 30,000 domesticated reindeer in the territory. This is the largest agricultural proposition the Alaskans have. The reindeer provides meat, milk, labor and clothing for the people, and there is every reason why the deer should be kept up to a high standard. There is even greater reason for this in Alaska than there would be in developing beef cattle in Illinois, or dairy cattle in New England, because the reindeer mean more to those who breed and handle them than our domestic cattle ever could. It is said that the domesticated deer are likely to decrease in size, and otherwise degenerate under ordinary conditions, and it is proposed to cross-breed them with the native wild caribu. The blood of the latter might be used to advantage in building up reindeer herds. These caribu are larger in size, and more vigorous, and are not so wild by nature. There are possibilities in this breeding, which reach beyond the limits of Alaska. The Arctic regions provide a white reindeer moss which really gives a form of pasture for these deer. It is not at all impossible that in the future these cross-breed deer may actually supply furs, and even meat for the people on the lower Pacific coast. Personally we have no doubt that time will see in lower Alaska a city as large and powerful as Pittsburg, through which the great traffic from the Alaska mines will be carried. Nature has provided this Arctic pasture for the reindeer, and it is not at all improbable that in years to come these animals will provide a fair share of our nation's meat supply.

Warning to West Virginia Stock Breeders.

As the horse breeding season approaches many horse dealers of the Middle West are shipping into the State of West Virginia, stallions and jacks to be used for breeding purposes. Wherever these animals are sold at reasonable prices there can, of course, be no objection to this practice. Many promoters, however, are organizing companies in the various farming communities for the purpose of selling to these companies, stallions and jacks at exorbitant prices. In many cases $2,000 to $3,000 is asked for a stallion and $1,200 to $1,800 for a jack. It is seldom that an animal is worth that much to the farmers composing these companies. First-class imported stallions may be purchased readily at from $1,200 to $1,800 and home bred animals are always available at from $800 to $1,200. Jacks should sell at from $600 to $1,200. Organizing a company and purchasing a high class sire is certainly a commendable step for any community to take but there is no reason why the stockholders of these companies should pay exorbitant prices when excellent animals may be secured for much less money. Before paying $2,500 to $3,000 for a stallion, look around and see if a better animal can not be purchased for less money.

Ailing Cow.

I have a young cow with second calf; gives rich milk. When the cream is made into butter the butter has a very strong smell; always the same Summer or Winter. The cow is hidebound and slackens on her milk very often for a couple of days at a time; then gives normal amount again. S.

The cow is in an unhealthy condition and apparently is affected with tuberculosis, or with chronic indigestion. Have her tested with tuberculin. If not found to be tuberculous, dry off milk flow and feed her carefully, with laxative feeds. She may be all right at next calving. If you do not care to do this sell her to the butcher if known to be free from tuberculosis. A. S. A.

SILO EXPERIENCE WANTED.—I am planning to build a silo the coming Summer, and would like to get the experience of those who have used square or octagonal silos. Can some of your readers give directions for building a silo large enough to feed six head of stock twice a day for nine months in the year? I have plenty of timber standing, that I can use. White pine and chestnut.

Ashby, Mass. J. W. R.

"You admit, then," inquired the magistrate, severely, "that you stole the pig?" "Yes," said the defendant. "Very well," returned the magistrate, with decision. "There has been a lot of pig-stealing going on around here lately, and I am going to make an example of you, or none of us will be safe."—Credit Lost.

Purebred Registered
HOLSTEIN CATTLE

Quantity of production and persistency of milking during long periods are well-known characteristics of Holsteins. Dropping her first calf at about two years old the average cow, if well cared for, will produce from 5,000 to 6,000 pounds of milk in ten months, and she will increase the production every year until, at five years, she will give from 7,000 to 9,000 pounds.

If fed to their ability to digest and assimilate food, many Holsteins will exceed this production.

Studebaker

WAGONS BUGGIES HARNESS

Tires that did not require setting in thirty years—on a Studebaker

AFTER thirty-six years of constant use Mr. William H. Horton, of Nineveh, N. Y., writes that his Studebaker farm wagon is as good as ever.

The wheels of Mr. Horton's wagon were run for thirty years without setting a tire. Mr. Horton writes:

"I have a Studebaker wagon purchased in 1877. The wagon now bears the original number and name of dealer; No. 33,435. Sold by Daniel Mann, Cobleskill. This wagon has had constant use since date of purchase and the wheels were run 30 years without setting a tire. The wagon is in good condition today."

WHAT IS THE REASON FOR THIS?

The fact that Mr. Horton used his Studebaker wagon for thirty years without setting a tire means that the wheels were properly built. Its hubs, spokes and felloes were all made of the best materials.

Anyone could have bought them and built them into a wheel, but Studebaker not only build of the best, but they season their materials properly, and then combine these materials in a scientific manner so as to distribute the strain over the entire wheel and therein lies the reason why the Studebaker wagons run so easily and last so long.

The fact that the wheel material is properly seasoned, dipped in oil and built in the Studebaker way is the reason why Studebaker's tires stay on for thirty years and often times longer.

You will be making a good investment when you buy a Studebaker wagon, a Studebaker Buggy—or Studebaker Harness. They are the best you can buy—and outlast others.

IMMUNITY IN HORTICULTURE.

PART I.

RESISTANT TYPES.—As horticulture advances the scope of species and varieties under cultivation increases wonderfully. Nature has been making selections on the basis of her laws, which is the survival of the fittest. The weaker have to give place to the strong and more disease resistant, for the vegetable world is alive with parasitic forms which seem to multiply as time goes on. This is especially noticeable in the cultivated forms of the things that are desirable for the use of man. It often occurs that the species or varieties that are most desirable for their fruit, foliage or bloom are more susceptible to the attacks of their enemies than those that are less desirable, but this is not always so. This is one of the points that deserves the closest observation and study and the most skilful attention of the plant breeder as well. Everyone should be on the lookout for the most disease resistant forms, for one slight variation in this direction may lead to something far more important than the original discovery.

HERDITY is one of the facts of life that figures very largely in the progress of both animal and vegetable improvement, while its laws are fixed they are violated occasionally by nature herself. The law is, that like produces like and this is constantly used and depended upon in large measure by plant breeders and practical growers also. However, it is a fortunate fact that violations do occur. It is the occasional production of the unlike that is of intense interest to the scientific experimenter, and often of great practical benefit to the grower. Instead of the seedlings reverting towards the old type they may be farther from it than the parental variations. Thus we may be able to step forward instead of backward. The entire field of modern horticulture is thickly spread with these fortunate variations. They make up the bulk of our orchards, vineyards, berry and vegetable gardens, our shade trees, ornamental shrubs and flowers. Nature has surpassed herself or has been led to violate her own laws for the benefit of man. And among all these almost countless variations those that show resistance to injurious influences are among the most useful as well as the most interesting.

VARYING RESISTANCE.—Everyone who has extended experience with the ordinary orchard fruits of North America knows that there are certain varieties that are more exempt from disease than others. The Seckel pear has long been known to be less affected by blight than most varieties and that the Bartlett is one of the worst to take this disease. One of the main points in favor of the Kieffer pear is that it rarely blights, while the LeConte, which is also a hybrid having the Oriental type in its breeding, is one of the most susceptible. Theoretically we do not know why there is this great difference in these two closely related varieties, yet we know from experience that it exists. All we can do is to take advantage of the fact in growing the trees of one in preference to the other. If nature's suggestion is not heeded the risk of failure must be taken. There are certain kinds of apple trees that are affected by blight and canker more than the average. The Transcendant crabapple is a very notable example of this fact, while the Hyslop is the reverse. Many of the Russian apple trees are so subject to the blight that they are almost worthless on this account. That aristocrat of the apple family the Grimes, has the serious fault of often being diseased at the base, and this to such a degree that many of the trees are short-lived. On the other hand the Delicious, which is another pomological aristocrat, is remarkably healthy in tree. The Baldwin apple trees are far more apt to have the canker than those of Ben Davis. The reason can scarcely be said to be because of difference in vigor, but to some constitutional peculiarity that enables the germs of the disease to find lodgment in one case and not in the other. There are peach trees that are severely troubled with curl-leaf and others that it seldom affects.

SUSCEPTIBILITY OF NUTS.—Among the nut trees there are marked differences in immunity from disease. The fatal chestnut blight that is devastating the native forest trees of the northeastern part of this country and the cultivated trees as well, does not badly affect the Asiatic species nor some of the hybrids. The germs of this dreadful scourge were imported from China in trees that were brought here many years ago, and not until the disease had made considerable headway was it even known by the scientists that it existed. It is not a virulent disease in Asia, because the species of Castanea (chestnut) growing there are practically immune to it. Our main hope of continuing the culture of this nut tree here is that varieties may be grown by cross-breeding the Asiatic and American species that will be immune to this disease and yet have the good flavor of our native nuts, which is far superior to that of any foreign ones. Already there are some such varieties on trial with good prospect of success. In due time these and others of similar character will be brought forward.

H. E. VAN DEMAN.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

PART III.

Some solid nuggets of peach wisdom came from George Friday of Coloma, Mich. "If your location is not frost-proof," he says, "don't consider peach growing." He has come to the conclusion that it will be the part of wisdom for the large peach growers to raise his own trees, as nursery-grown trees are exposed to many mishaps and substitutions of varieties. Trees are often dug and left on the ground for a day or two; or they are left to dry out in Winter storage; or boxed after leaves have started in Spring; or the roots have been kept so wet that they mildew. A sun-dried, sour-dried, mildewed, or leaf-boxed tree is no good. We don't want to reset trees in place of those that have died. Better try to get a good start the first time, and that is easier to do with home-grown than with nursery-grown trees. The safest way to get the trees started is to set them (as also raspberries and strawberries) soon after they are dug. For Spring setting, holes may be dug in the Fall and filled with manure. Take the manure out in early Spring, let the holes dry out, and set the trees. Prune very little for two or three years. After that prune a little where needed, but leave the young sprouts all through the center of the trees. The fruit grows there. Spray early in Spring. You have only a few days when spraying for curl-leaf can be done. Cultivate to August; then plant cover crops, such as rye and vetch. The land is bound to be short of humus before the trees die of old age. To thin, go over the trees soon after the June drop once, and leave the specimens six to seven inches apart. The average life of the peach tree in Michigan is 12 years. For the first two years, corn, tomatoes or other vegetables may be grown in the peach orchard. Mr. Friday has made $200 in early tomatoes in a young peach orchard per acre.

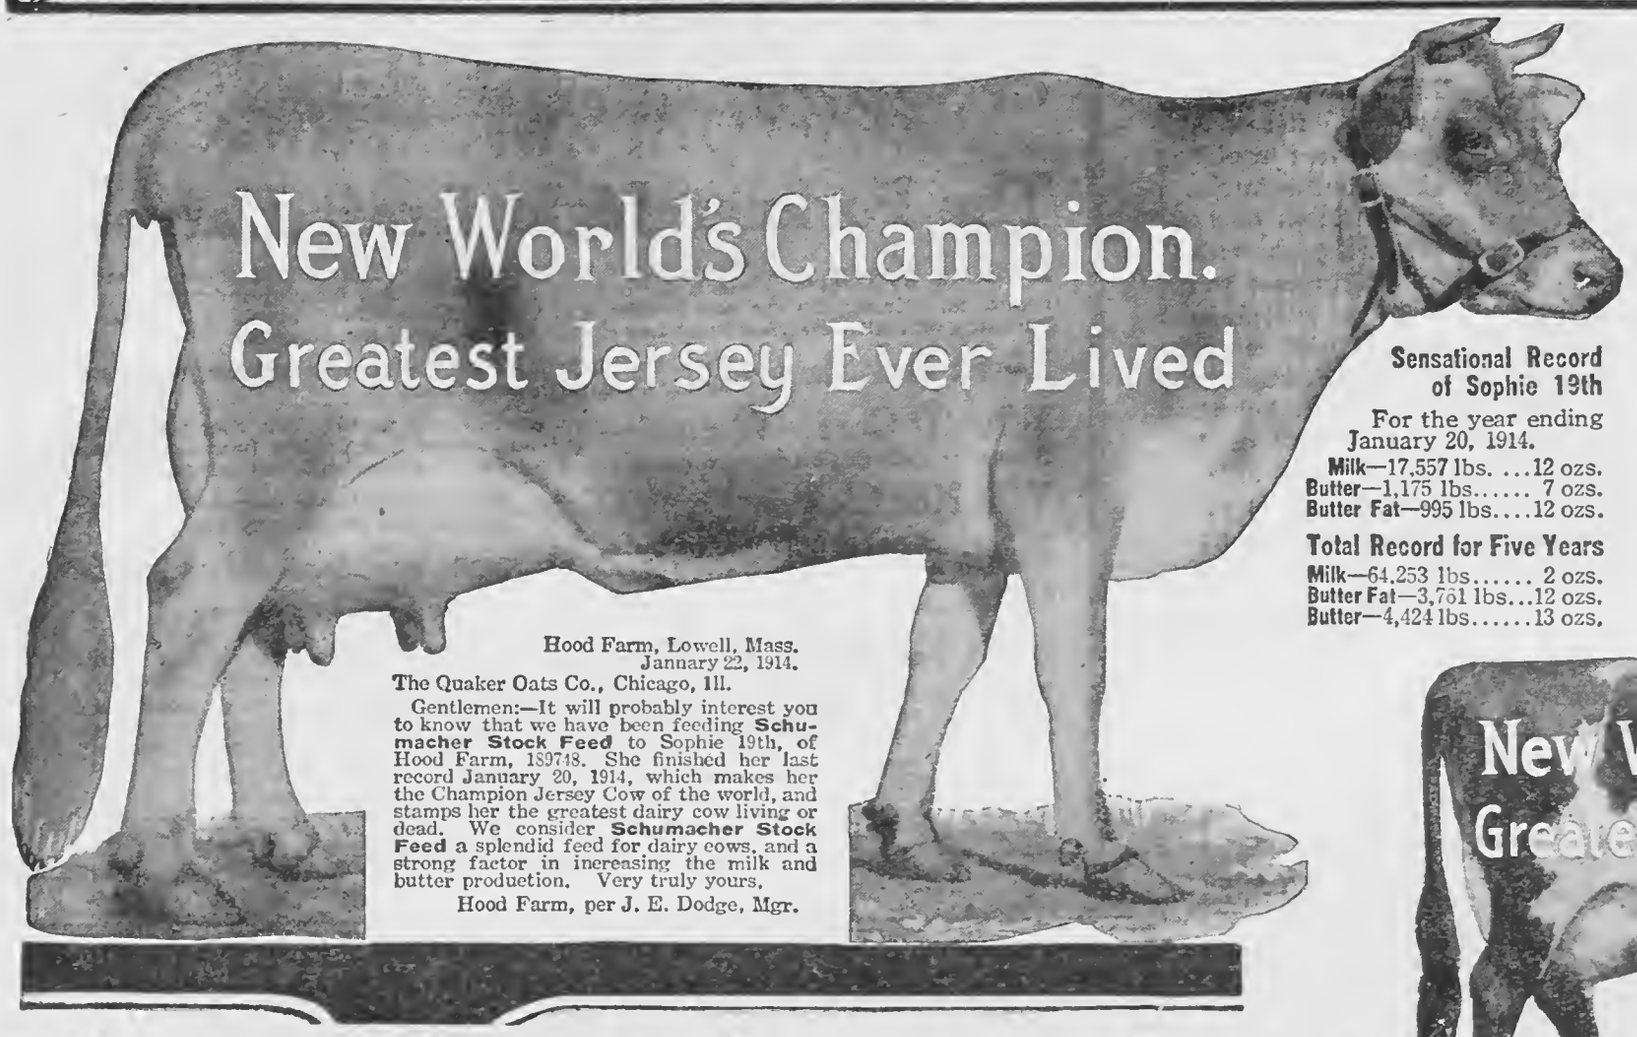
From Dr. James A. Bizzel's talk on our nitrogen supplies, it appears that at present no great increase in that output can be looked for except by manufacture from the atmosphere of such compounds as calcium nitrate and cyanamid, and by the greater utilization of legumes. The manufacture of the artificial commercial nitrate compounds has not yet reached imposing proportions. Cyanamid comes in two forms, powdered and granulated, and contains 15 to 17 per cent of nitrogen, and about 25 per cent slaked lime. There are about a dozen factories now in existence, of which four are in Germany, four in Italy, one each in France, Norway, Switzerland, and one in Niagara Falls, Ont. The latter produces about 31,000 tons a year. The output of the Niagara Falls factory is mostly sold to southern fertilizer dealers. Loss of ammonia in home mixing can be prevented by addition of 80 pounds of acid phosphate to 100 pounds of cyanamid, although this may revert the phosphoric acid.

Dr. Reddick of Cornell looks with considerable favor upon the use of dust instead of liquid sprays, especially for apple scab and Codling moth, possibly other insects. Of course, the dust spray is no remedy for scale. But in a year of mild infestation, the dust has given as good results in insect control as liquid spraying. He has worked on this problem for three Summers, using finely divided sulphur and 20 per cent of arsenate of lead, and finds that he can cover four times as many trees with dust as with liquid. The time for making applications for the Codling worm is very limited. He thinks that 10 per cent of arsenate in the mixture would have been sufficient. As to the danger in breathing the dangerous dust, he says, the men went through three seasons of using the dust, and it did not appear to hurt them.

Prof. Parrott tells of the fruit tree leaf-roller as a new pest in New York orchards. Unlike the psylla, its eggs are very susceptible to oil sprays. Miscible oils, in 1 to 15 solution, applied when buds are swelling, will destroy 80 to 98 per cent of the eggs. The leaf-roller is often very destructive to the buds.

T. G.

Stop! Look! Read!



Hood Farm, Lowell, Mass.
Jannary 22, 1914.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—It will probably interest you to know that we have been feeding **Schumacher Stock Feed** to Sophie 19th, of Hood Farm, 189748. She finished her last record January 20, 1914, which makes her the Champion Jersey Cow of the world, and stamps her the greatest dairy cow living or dead. We consider **Schumacher Stock Feed** a splendid feed for dairy cows, and a strong factor in increasing the milk and butter production. Very truly yours,

Hood Farm, per J. E. Dodge, Mgr.

Sensational Record of Sophie 19th

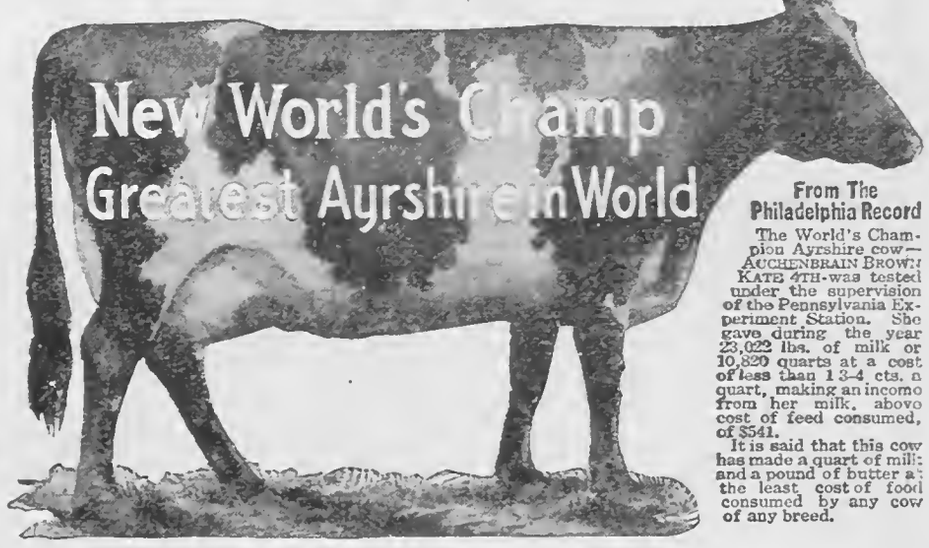
For the year ending January 20, 1914.

Milk—17,557 lbs. ...12 ozs.
Butter—1,175 lbs..... 7 ozs.
Butter Fat—995 lbs....12 ozs.

Total Record for Five Years

Milk—64,253 lbs..... 2 ozs.
Butter Fat—3,761 lbs...12 ozs.
Butter—4,424 lbs.....13 ozs.

FEED PROVES Greater Than BREED



From The Philadelphia Record

The World's Champion Ayrshire cow—AUCHENBRAIN BROWN KATE 4TH—was tested under the supervision of the Pennsylvania Experiment Station. She gave during the year 23,022 lbs. of milk or 10,820 quarts at a cost of less than 1 3-4 cts. a quart, making an income from her milk, above cost of feed consumed, of $541.

It is said that this cow has made a quart of milk and a pound of butter at the least cost of food consumed by any cow of any breed.

World's Records Smashed Again!

Many Breeds—BUT—All Fed One Feed!

Again and again, during the past year, the world has been astonished at the marvelous productions of milk and butter from single cows. Think of getting over 8¾ **tons** of milk and over ½ **ton** of butter from one cow **in one year.**

First one breed, then another, and still another have smashed all previous world's records, until in amazement we ask, "Is it possible," and "how can it be done?"

The answer no longer is "getting the right breed." Instead, "it's getting **the right feed**" and the right individual. Feed has **proved** greater than breed! This is **conclusively proved** by the fact, that regardless of the breed of these **"Queens of the Dairy World"**—be it Jersey, Holstein, or Ayrshire, which have "beaten" all records to date—they were all fed the same feed—the world famous, **record-making, record-breaking—**

Schumacher Feed

Therefore, we proudly—justly—proclaim that **"Feed—SCHUMACHER FEED—proves greater than breed."** Read the wonderful world's records just achieved by Sophie 19th of the Hood Jersey Farm, who finished her yearly test Jan. 20, 1914. Then read what Auchenbrain Brown Kate 4th, Queen of the Ayrshires accomplished—the cow which has the distinction of producing **more milk and butter at least cost of any cow in the world.** Then read the record of the first cow in the world to produce 40 pounds of butter in a week—Valdessa Scott 2nd. Then read the record of the second 40 lb. cow and note that all these remarkable, sensational performances were made with **SCHUMACHER FEED** as a base of their rations. Read their owners' letters. It needs no further evidence to convince anyone that **SCHUMACHER FEED** is the "best in the world." If it is "best" for the "best cows in the world" it certainly is best for your cows.

Try This Record-Breaking Feeding Plan

—a plan used by the World's Record makers, and you will be surprised at the results: Mix three parts **SCHUMACHER** with one part of any good high protein concentrate you are now feeding, such as Gluten, Cottonseed Meal, Distillers' Grains, Oil Meal, Malt Sprouts or Blue Ribbon Dairy Feed. Your cows will not only show a **splendid increase** in flow but in due time will show a **splendid improvement** in health, vigor and appearance. **SCHUMACHER** furnishes that stamina—vitality—ability—to stand up under heavy milk production, so necessary in profit-producing dairy cows.

If your dealer does not sell SCHUMACHER write us.

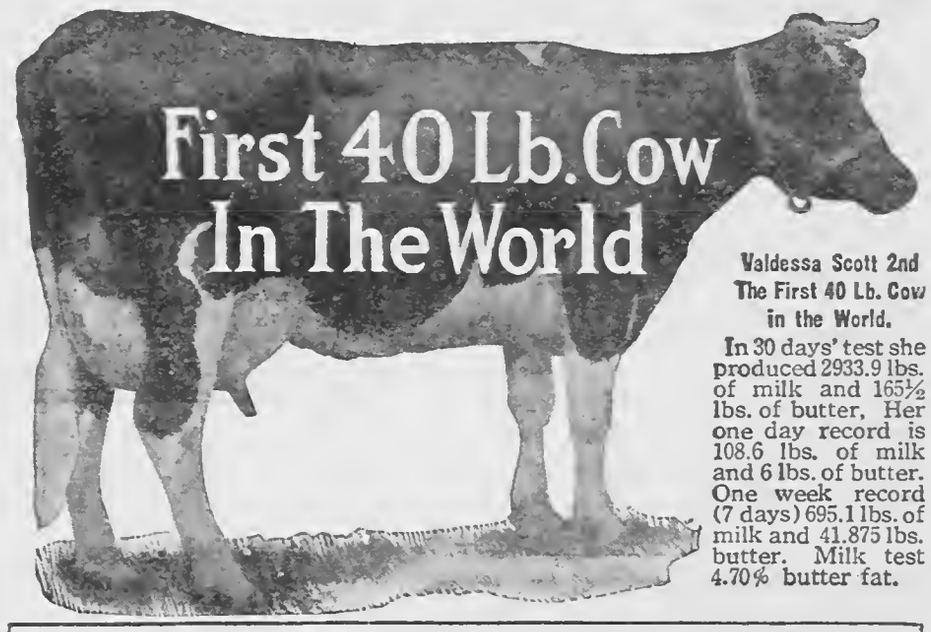
FREE FEEDING FACTS If interested, write us for "Feeding Facts" and get some information worth hundreds of dollars to any dairyman or farmer.

Narberth, Pa., December 6, 1913

The Quaker Oats Company, Chicago, Ill.,

Gentlemen;---We have been feeding your **Schumacher Stock Feed** to our Ayrshire and Jersey cows which are on test for Official Records, and like it mixed with other grains. Our World's Champion Ayrshire Cow, AUCHENBRAIN BROWN KATE 4TH, who has just finished her year's work with a record of 23,022 lbs. milk and 1080 lbs. of butter, was fed **Schumacher Stock Feed** as part of her ration. We find that **Schumacher Stock Feed** is one of the best feeds we have ever used in our mixtures. Yours very truly,

(Signed) E. S. Denbler, Superintendent, PENSHURST FARM.



Valdessa Scott 2nd
The First 40 Lb. Cow in the World.

In 30 days' test she produced 2933.9 lbs. of milk and 165½ lbs. of butter, Her one day record is 108.6 lbs. of milk and 6 lbs. of butter. One week record (7 days) 695.1 lbs. of milk and 41.875 lbs. butter. Milk test 4.70% butter fat.

Finderne Stock Farm, Finderne, N. J.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—During the past two or three years we have been feeding your **Schumacher Feed** and have secured splendid results. **Schumacher** was incorporated in the ration of Valdessa Scott 2nd during her wonderful result producing test. Used as a base with a good protein concentrate it is a winner.

Yours truly, B. Meyer, Owner.

JOHANNA DEKOL VAN BEERS

The Second 40-lb. Cow—and her smashing 60, 90 and 100 day tests:

60 days, milk 5,552.00 lbs., butter, 290.00 lbs.; 90 days, milk 8,147.90 lbs., butter 418.13 lbs.; 100 days, milk 8,987.40 lbs., butter 460.19 lbs.; 120 days, milk 10,490.00 lbs., butter 540.97 lbs.; **7 day Record**, milk 663.00 lbs., butter 40.32 lbs.

Brookline Farm, Dec. 8, 1913.

The Quaker Oats Co. Chicago, Ill.

Regarding **Schumacher Stock Feed,** will say as a feed for dairy cows or young cattle, I know of no feed equal to **Schumacher.** It certainly contains all the ingredients necessary to put the finish and gloss on an animal and more than that, the results obtained through the pail makes it the cheapest feed that I have ever fed. Johanna, in fact all my cows are fed every day a ration of **Schumacher Feed.** To any one feeding cattle for show, I would especially recommend **Schumacher.**

Yours truly, T. E. Getzelman, Prop., Hampshire, Ill.

THE QUAKER OATS COMPANY,
Dept. 12 CHICAGO, U. S. A.

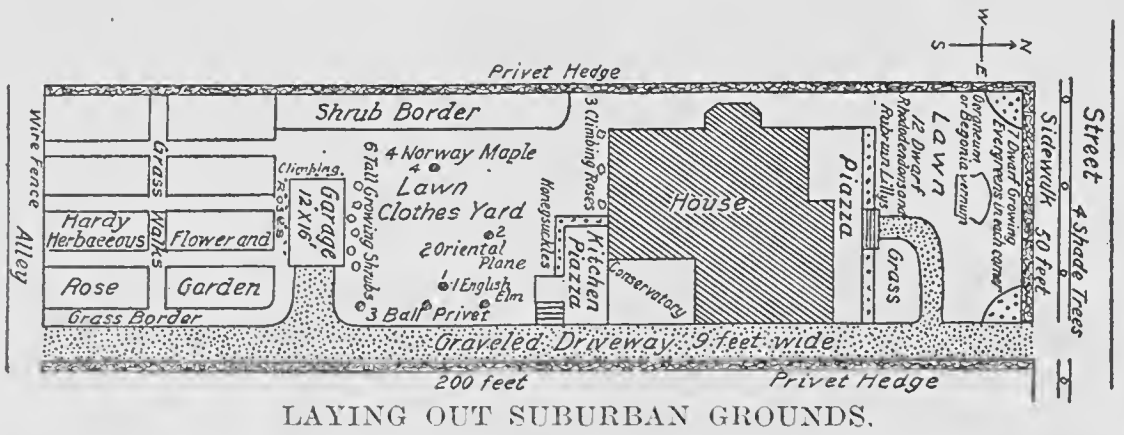
[25]

BEAUTIFYING THE HOME GROUNDS.

PART III.

The cut shows a small suburban home, the grounds of which were improved at the time the buildings were put up. The lot is 50 by 200 feet, and is enclosed in front and both sides by a privet hedge, and by a neat wire fence with gates in the rear. The drive-way is nine feet wide and extends the full length of the lot. The house stands 25 feet back from the front hedge, the front yard is about 25x40 feet in size. In each corner next to the front hedge is a small triangular shaped bed, in each of which is planted seven dwarf-growing evergreens. In a narrow bed on each side of the stoop, next to the piazza are 12 hybrid Rhododendrons, interspersed with Lilium rubrum.

In the center of the yard is a keystone-shaped flower bed, to be used for either geraniums or Begonia Vernon. The garage is situated about 36 feet away from the house; on the north side of the garage are planted six tall-growing shrubs partially to screen it from view. Between the garage and the house is an open court, with lawn, which is used for a clothes-drying yard. Along the drive-way are three ball privets about three feet high. Along the west hedge, starting near the southwest corner of the house and extending to the flower garden, is a hardy flowering shrub border containing 50 small shrubs. In this court are planted the only large trees on the lot, one English elm, one oriental plane, and one Norway maple. The kitchen piazza is planted on two sides with honeysuckle trained up to the cornice on poultry wire. Three climbing roses are trained up to the south end of the house, and six to the garage.



LAYING OUT SUBURBAN GROUNDS.

The flower garden lies between the garage and alley, and is planted with hardy roses and hardy herbaceous plants, the whole forming a neat and exceedingly pleasing arrangement. The approximate cost of plants and shrubs was about $120 at the nursery.

It will be seen by the plans given, the possibilities that can be achieved in the way of beautifying small home grounds at a very small outlay of money for trees, shrubs, plants, etc. Plans for such improvements may be made at trifling cost.

K.

To Prevent Souring from Green Crops.

I wish to plant a field to Cuthbert raspberries one year from this next Spring. I expect to give the field a good stuffing with humus next year. I had planned to use field peas, buckwheat and rye. What are the usual precautions to be taken to prevent these crops from souring? Ought this field to be limed? Would subsoiling be advisable? H. T.

Michigan.

Several plans are followed to prevent excessive souring of the ground when cover crops are plowed under. In some cases the crop is cut with a mower before plowing. After cutting, the crop lies on the ground for a few days until it is thoroughly wilted, and is then plowed under, taking pains to rake or work ahead of the plow so as to get the crop into the furrow. This does not usually pay, as it takes too much time to turn the stuff under properly. The plan which we follow on our own farm is to plow under the cover crop when it has made full growth, and immediately follow with an application of 600 pounds or more per acre of slaked lime, well harrowed in. Then we follow with a roller, or heavy drag, and pack the soil firmly. The object of this is to crush down the green vines underground into a compact mass, so that the air will not work in too freely and cause a rapid fermentation. As a rule, raspberries do not respond freely to the use of lime, and we should not use lime for such a crop, except as above stated to prevent souring very variable in form and size, showing many apparently transition forms between it and Sieboldiana. Selected types will undoubtedly be grown in the future. Both these trees are said to make good stocks on which to grow the Persian (or "English") walnut on account of their rapid growth, but there has not been time yet to demonstrate this. W. C. D.

Walnuts from Iowa.

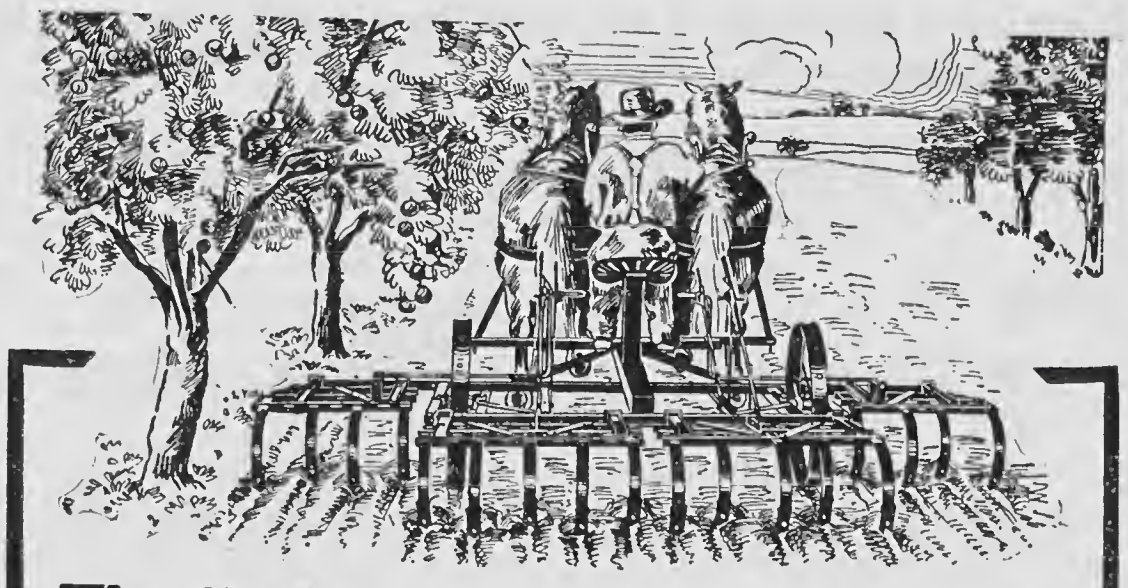
I am sending a box containing a couple of walnuts. I think they are Japanese walnuts, but am not sure. They were raised near here and procured from the nursery as English walnuts. I would like to know what they are, and if they would be profitable grown commercially. They killed back, I am informed, the first two Winters; since they have been perfectly hardy. I know of Cordiformis walnuts growing further north than this.

Danville, Iowa. W. P. W.

The nuts are Juglans Sieboldiana, one of the Japanese walnuts. Other instances have been reported where nurserymen have sold this nut for the "English" walnut. There is no excuse for this, as the trees are as different as apple and pears. It grows very rapidly and makes a beautiful tree, but unfortunately the nut is almost worthless on account of the difficulty of getting the meat out of the shell. The other Japanese walnut, Juglans cordiformis, so called because of its heart shape, cannot be told in the nursery from Sieboldiana, and makes an equally beautiful tree, but the nut is very superior. It comes easily from the shell and has a good flavor, somewhat like the butternut. It is said that if it is boiled for five minutes and then cracked while hot the meat will come out whole. Good authorities consider it a valuable nut for planting. It is a very hardy tree and is said to grow in the mountains of Japan, where snow falls every month in the year. It is

---

WILKINS was near the exploding point when his neighbor met him in the street. "That man Tompkins," he burst out, "has more cheek than anyone I ever met!" "Why?" asked his neighbor curiously. "He came over to my house last evening and borrowed my gun to kill a dog that kept him awake at night." "Well, what of that?" "Why," shouted Wilkins, "it was my dog he killed!"—



The Forkner Light Draft Harrow

Broad Gauge—Works right up to the trees. Detachable end extensions reach far out from horses' path. Gets in under the lowest branches, stirring up the soil evenly and thoroughly without breaking boughs or knocking off fruit. *Neither team nor driver has to dodge the boughs.*

Light Running—Two horses will cover the ground quicker, easier and better than with any other.

Wheels Carry Weight—not your horses' necks. Whether you ride or walk, machine has perfect balance. Broad rimmed wheels run on greased axles, carrying weight of machine and driver.

Will Not Clog or Drag Dirt—Frame is well up above ground. Teeth lift soil and turn it way over.

Each Section Hinged In Front With Adjustable Couplings—Lever regulation in convenient reach affords easy control.

Built For Long, Hard Service—Frame of strong, angle steel—teeth best oil-tempered spring steel.

The Illustration Will Tell You Much if you are at all experienced with other lines. No fancy frills—but a machine with height of wheel, breadth of sweep and arrangement of teeth that means covering a lot of ground in a day and doing it thoroughly.

Horses, Mules & Cows Should be CLIPPED

They are healthier and give better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. Horses and mules take on new life and energy when clipped and naturally work better. Clipping the flanks and udders of cows prevents the dropping of filth into the milk. The best and most generally used clipper is the Stewart Ball-Bearing Clipping Machine, the only machine that can be used on horses, mules and cows without change. It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

Price $7.50 Get one from your dealer or send us $2.00 and we will ship C. O. D. for balance. Your money and transportation charges returned if you are not satisfied.

STEWART'S No. 9 BALL BEARING SHEARING MACHINE

Get More Money for your wool. You not only scar and disfigure your sheep but lose a dollar on every six you shear the old way. Figure how much more money you'll get if you use a Stewart Shearing Machine. It's the most perfect hand operated shearing machine ever devised. Has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of latest improved Stewart pattern. Price complete, including 4 combs and 4 cutters of the celebrated Stewart quality is $11.50 Get one from your dealer, or send $2.00 and we will ship C.O.D. for balance. Money back if not satisfied.

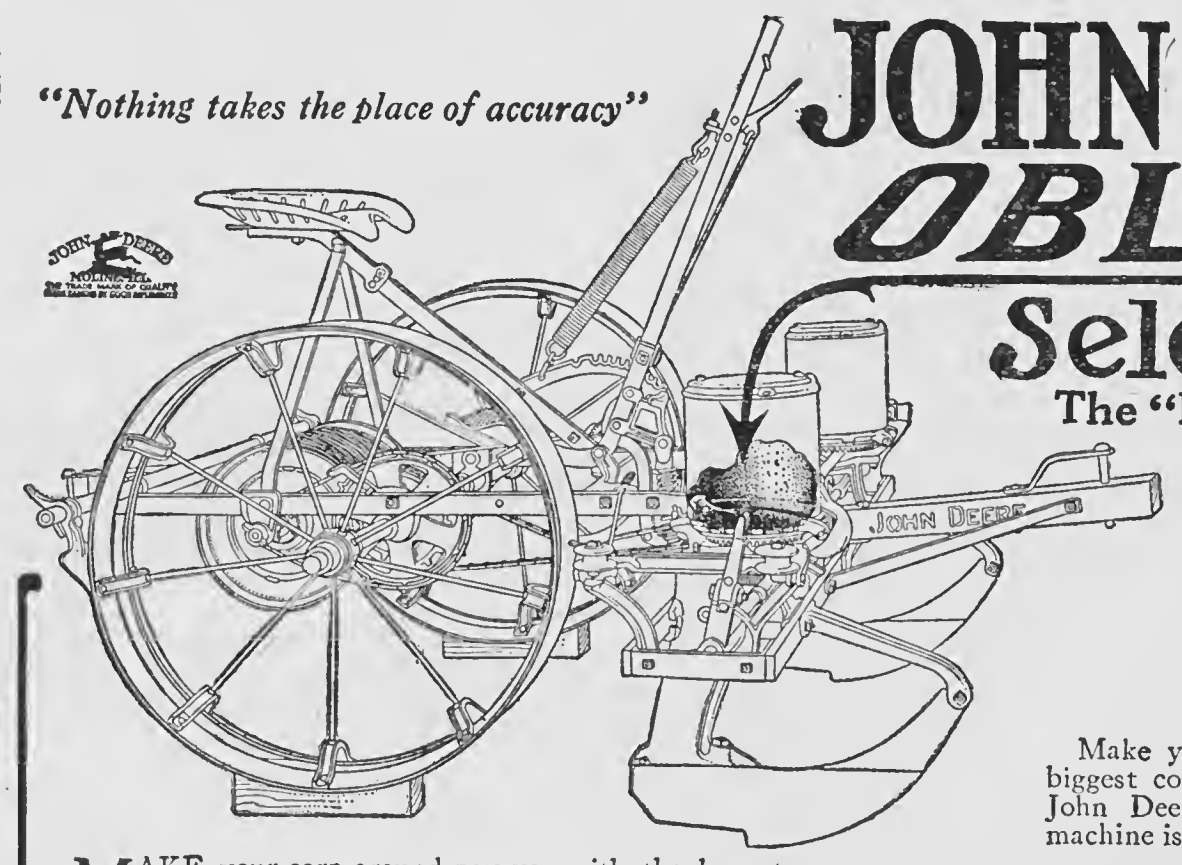
"Nothing takes the place of accuracy"



JOHN DEERE OBLIQUE Selection

The "Natural" drop

This machine maintains high accuracy even with ordinary seed. With well selected seed its dropping accuracy is practically perfect.

MAKE your corn ground pay you with the largest possible yield, by making sure that the required number of kernels is in each hill.

The seed must be there. Every "miss" means just that much thinner stand. No amount of cultivation can make up for inaccurate planting. The loss of one ear from every hundred hills costs you the price of one bushel per acre.

For years the John Deere Company has concentrated on accuracy in planting devices. The "Oblique Selection" solves the problem.

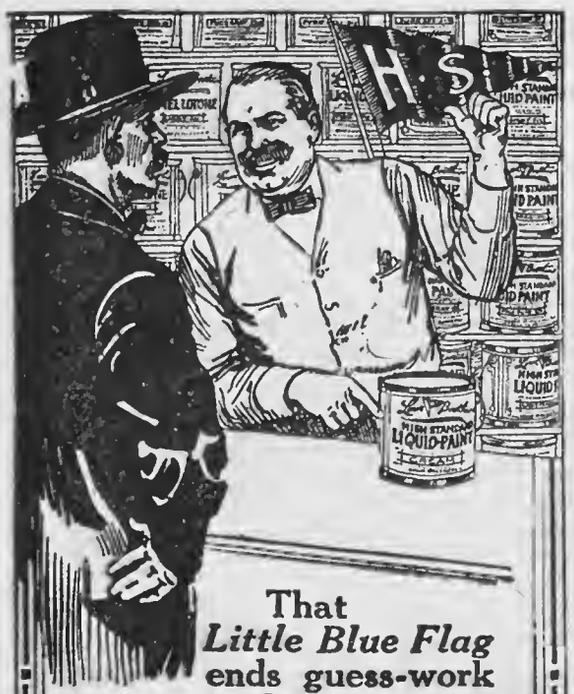
The results of its use are so profitable that many corn growers have discarded the best of previous machines. It is as far ahead of the old Edge Drop as it was ahead of the round hole plate.

Make your spring planting the start of your biggest corn crop by accurate dropping. The John Deere "Oblique Selection" will do it. The machine is a splendid investment.

Free Book Gives Valuable Corn Facts

Write us today for free booklet "More and Better Corn". It tells you why the average yield for the United States is only 25 bushels an acre, whereas better methods have produced 125, 175 and even 255 bushels per acre in places. It also describes and illustrates the John Deere "Oblique Selection" Corn Planter. The book to ask for is No. D 33

John Deere, Moline, Illinois



That *Little Blue Flag* ends guess-work in buying paint

"You are absolutely sure of satisfaction in buying paint, varnish, enamel, or anything else of the kind, if you see the 'Little Blue Flag' on the pail or can. It is the stamp of highest quality.

"I am glad to recommend

Lowe Brothers High Standard LIQUID-PAINT

Scientific and exposure tests at the factory, as well as use on thousands of farm buildings prove that "High Standard" paint will withstand the weather a long time, keep its color, and leave a good surface for repainting. You'll save money and get sure protection for your property by paying a few cents more a gallon for "High Standard" paint. It's sold by a dealer near you. Ask his name if you don't know. EVENTS OF THE WEEK.

Henry M. Teller, United States Senator from Colorado for 30 years and Secretary of the Interior in the Cabinet of President Arthur from March, 1882, until March, 1885, died Feb. 23, in his eighty-fourth year. He had been in poor health nearly two years. Death was ascribed to heart disease and infirmities incident to old age. Ex-Senator Henry M. Teller, long one of the most striking political figures of his adopted West, began his service at the national capital on March 4, 1876, when Colorado was admitted into the Union. One of the early members of the Republican party, he took a conspicuous part in its councils until the national convention of 1896, when he bolted because of the adoption of the gold standard plank and walked out of the hall with a score of others who believed with him in the Bryan doctrine of the free coinage of silver at the ratio of 16 to 1.

Secretary Bryan has instituted negotiations with Great Britain with a view to the protection of migratory game birds which pass between Canada and the United States. He is acting under authority of a law of Congress. The proposed treaty applies also to birds that visit the British colonies in Central and South America. It is understood that this treaty will be followed by others to be negotiated between the United States and France, Denmark and Holland, which have colonies in the Western Hemisphere, and also with the Latin American countries and possibly with still other countries of Europe or Asia.

The storm which swept southern California Feb. 18-21, resulted in a loss of seven lives and property damage of $4,500,000. The rainfall was from 10 to 12 inches and this flood was increased by high winds which made the water much more destructive. City engineers estimate that Los Angeles suffered a damage loss of at least $1,500,000. One hundred and fifty thousand dollars represented the damage to city streets alone. The balance was made up of losses to railroads and to citizens whose homes were swept away with all their household effects. Except in the vicinity of Pomona, where young groves suffered severely, orange growers reported little damage. Ranches and small farms in the lowlands were inundated. The torrents washed away hundreds of feet of the Los Angeles River bank in the heart of this city. Buildings were undermined and toppled over and many homes were washed away.

The United States Supreme Court handed down about 40 decisions in Washington, Feb. 24. One of them is of far reaching effect on the enforcement of the Federal pure food and drug act, and similar State laws. Under this decision, the Government in order to libel foods that have been "treated" or adulterated will have to prove that the added substance is present in sufficient quantity to injure health. The mere fact that the deleterious substance is present will not be sufficient. Government authorities fear this decision will greatly hamper them in the enforcement of the law. Another important decision sustained the validity of the section of the Payne-Aldrich tariff law which imposed a tax on foreign built yachts owned and used by citizens of the United States.

By a vote of six to one the New York Court of Appeals ordered, Feb. 24, a new trial for Charles Becker, the former police lieutenant, convicted of the murder of Herman Rosenthal, the gambler, out of whose "squeal" against the police graft system of New York, for which it was charged he was shot to death, grew probably the greatest series of investigations, exposures and convictions for murder and lesser crimes that ever occurred in the United States. The court based its reversal upon the errors it held Justice Goff, the presiding judge, made in many of his rulings during the trial. The court did not pass on the question whether the weight of evidence against Becker was sufficient to warrant his conviction. A dissenting opinion was written by Justice Werner. The court refused unanimously the application for a new trial of the four gunmen who were convicted with him for the Rosenthal murder. In the prevailing opinion in Becker's favor, written by Justice Hiscock, 15 errors by Justice Goff were cited, some of which, it was held, "passed beyond the limits of discretion and were erroneous as matters of law," while others had the tendency unwarrantably and unnecessarily to embarrass and hamper the defendant's counsel.

Representative Hinebaugh has introduced a bill into Congress which has had a reading and has been referred to the Ways and Means Committee, having as its object the taxation of any person, firm or corporation conducting a mail order business interstate direct to the consumer. The bill proposes to levy a tax of one per cent. on the total cash value of goods so sold. Further, the person, firm or corporation conducting a mail order business must provide proper books of account showing every sale so made and render a statement thereof, as of Dec. 31, to the secretary of the Treasury, the tax to be paid the following March 1. The Federal Courts are given power to enforce payment and the money so collected is to be apportioned to the various States of the Union in the ratio of the actual amount of goods sold in each State.

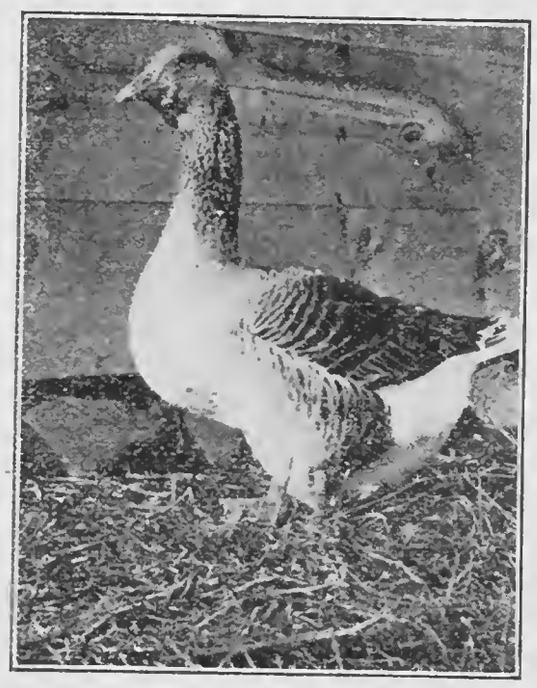
The Henyard.

Toulouse Geese.

The Toulouse is the largest of our domestic geese. Massive is the most descriptive term that can be applied to a mature specimen of the standard weight, which is 25 pounds for a gander and 20 for a goose. A few breeders of stock selected for size have birds that exceed these weights by several pounds, and one intending to start with Toulouse geese will find it profitable in tne end to purehase eggs or birds from large stoek. The first cost may be high, but the ultimate profit will more than make up for this. The average weight of geese found on farms is hardly more than half the standard. The name of these geese comes from the city of Toulouse in France, near which many of these geese are reared. The prevailing color is gray, shading to dark brownish gray above and to white below. Occasionally dark feathers appear in the white, and white feathers in the primaries and secondaries of the wings. These disqualify for the show room. The bill should be of a pale orange



A Well-Formed Toulouse.

color and the shanks and feet of a deep reddish-orange. The body should be of moderate length and broad. A dewlap under the throat should develop with age, and is a desirable feature in the show room. Toulouse geese of both sexes usnally acquire a keel as they increase in age. Frequently the keel of an old goose will drag on the ground as she walks.

Toulouse geese do not mature so fast as some other breeds and consequently are not so profitable for selling at 10 or 12 weeks of age, but are the best for Christmas sales. In December they attain their greatest weight for the season. On account of their predominance in the markets at this season they are sometimes termed the Christmas goose. The size of Toulouse geese makes them quiet and docile. They are contented to remain near home, and less inclined to wander than some of the smaller breeds. While they have well developed voices they are ordinarily rather quiet. In egg-laying they compare well with the other large breeds. The Government bulletin on geese gives 40 as the average number of eggs laid by Toulouse geese. Another report based on a two years test gives 26 as the average. Individual reports give larger numbers. Doubtless, as with hens, much depends upon the individual, and geese raised principally for eating, have been bred mainly for size, and less attention has been paid to egg-laying than with other domestic birds. Here is a field for work and a chance for improvement with all breeds of geese that have hardly been entered upon or begun. The goose, the largest of our domestic birds, with the exception of the turkey, one of the most easily reared and by far the most intelligent, is worthy of a much larger place in our farm economy than it has ever yet filled.

W. H. HUSE.

Value of the White Leghorn.

In a short article on page 132, signed J. F. C., a heavy cloud is cast over the Leghorn as an economical converter of food into eggs. J. F. C. even says that he will produce eggs on less food per egg with heavy birds than he can with Leghorns. If so he cannot have a good strain of Leghorns. My own personal experience has been the other way decidedly. 50 Leghorns laying better per hen on less food than 40 heavy birds when both flocks were laying well. Of course J. F. C.'s and mine are only isolated instanees, and as sueh of little value, but very interesting data on this point eomes from the Australian egg-laying contests where 10 years' work with accurate records kept should do away with some of the nncertainty that comes from conflieting statements by different men here. In those 10 contests the only breeds represented by over 500 hens are the S. C. White Leghorn, Black Orpington and Silver Wyandotte. While the color of the feathers of the heavier breeds is different from that most frequently fonnd in America, the fundamentals remain unchanged. The following table is taken from one on page 60 of Farmers' Bulletin 66, issued by the Department of Agricultnre, New South Wales, with the money valne changed from shillings to dollars and cents:

Breed	No. of hens Represented	Av. laying per hen	Av. Valne of eggs	Av. Profit over feed
Leghorns	1212	183.4	$4.36½	$2.87
Orpingtons	786	166.6	3.88	2.44
Wyandottes	684	160.5	3.71½	2.35

The above is for the first year's laying, two year tests have been conducted on a somewhat smaller scale; they show the most important item, the profit over feed, for Leghorns, $5.45½; Orpingtons, $3.94½; Wyandottes, $4.37½. Three year tests have not progressed far enough to give any reliable data. The bulletin does not consider these results to give an exact index to the relative merits of different breeds, but does afford a pretty accurate guide for the poultryman to work on; and, judging from the general feeling towards Leghorns in America, Australian views as to the relative merits of different breeds are shared here.

Connecticut. FRANCIS F. LINCOLN.

Meat and Mash for Hens.

We have 60 hens which we feed three quarts scratch feed and boiled vegetables at six o'clock in the morning; at 11 o'clock 1½ quarts feed and at four o'clock three quarts cracked corn. I would like you to tell me of a mash that I could feed in the morning, also if the way they are being fed is right. They also have meat, grit, eharcoal and a pan of bran in front of them at all times. How can I prevent some of them from eating too much meat? C. G. G.

Perhaps the best way to feed meat, either in the form of meat meal or beef scraps, is to mix it with the mash that is given the hens, making this mash from one-sixth to one-eighth meat, by weight. A good mash for your use might be composed of 50 pounds each of cornmeal, wheat bran, wheat middlings, gluten feed and meat meal, to which one pint of fine salt is added. This mash may be fed dry in an open hopper kept constantly before the hens, or moistened with skim milk or water, and fed once daily. The feeding of a dry mash of mixed ground grains, as you are now feeding bran, is considered preferable to moist mashes by most poultrymen. M. B. D.

Jim Rohan and Winners of Belle City's Eight World's Championship Hatches

Jim Rohan, Pres.

Mr. Geo. W. Black, Ind. Winner 1911

Mr. Wm. C. Schott, Iowa Winner 1913

Mrs. Laura J. Clark, Illinois Winner 1911

Mrs. Alta Hamlyn, Ind. Winner 1913

Mr. F. E. Bennett, Ohio Winner 1912

Mrs. F. H. Osman, Ohio Winner 1910

Mrs. M. J. Clifton, Okla. Winner 1910

"Tycos" Cup, won by the Belle City

Write Today for My Free Book, "Hatching Facts"—It Means More Money to You

Get the whole story of these Championship hatches with the Belle City. Get the stories of thousands of men and women who are getting 100% perfect hatches. Satisfy yourself. This great book is free. Write for it today. No other incubator made, not even the highest priced, approaches this amazing Belle City record. I have the letters of owners to prove it. Many of these letters are printed in my new book, "Hatching Facts." They tell you how Belle City owners are making the most money in the poultry business. You certainly want this book.

When you buy from me you get an exact duplicate of the prize winning

Eight Times World's Champion Belle City

Used by Mrs. Alta Hamlyn, of Indiana, who joins the Belle City's list of World's Champions with TWO 100 per cent hatches scored by her Belle City Incubator in Successful Farming's 1913 contest. Mrs. Hamlyn says, "I can hatch every fertile egg in my Belle City, and regard your honesty the key-note to success."
Also used by William C. Schott, of Iowa, who shares the 1913 honors. His 100 per cent hatch—140 chicks from 140 eggs—won another World's Championship for the Belle City in Successful Farming's 1913 contest. Mr. Schott writes: The Belle City is the best incubator made—has given much more satisfaction than high priced machines." Mr. Bennett was winner in 1912, Mr. Black in 1911, and Mrs. Clifton in 1910 Successful Farming contests.

The Kind "Uncle Sam" Uses

I send you an exact duplicate of the Belle City machines chosen by the U. S. Government. The Department of the Interior is one of my customers. The Department asked for prices on 300-egg sized machines, but ordered my 140-egg Belle City machines, because even "Uncle Sam" wants to get Championship hatches, too. I send you an exact duplicate of the Belle City Hatching Outfits used by leading agricultural colleges.

I send you an exact duplicate of the Belle City Hatching Outfit that won the gold lined silver "Tycos" Cup and the Championship for Mrs. Osman and of the Belle City Outfit that won *two* World's Championships for Mrs. Clark, 140-chicks from 140-eggs, in Missouri Valley Farmer and Nebraska Farm Journal Hatching Contests—2000 hatches entered.

No One Else Can Give You *So Much* Hatching Value For *So Little* Money

Write for My Low Price—

I will show you why I can send you my Belle City Incubators and Brooders at half or less than half that others cost you. You buy direct from me. You pay no agents' or dealers' profits, and my big volume enables me to cut my profits down lower than anybody else can afford, yet I guarantee them to outhatch any other machine, no matter what the price. I prepay the freight and ship quick from Kansas City, Minneapolis, Buffalo or Racine.

Don't delay writing for this great book—showing Incubator and Brooder in actual colors. Great big illustrations true to life—also description—full particulars, facts, proofs, everything you want to know. Also pictures of lots of my customers together with their letters showing what they have done. You profit by their experience. Even if you buy elsewhere I want you to have this book. Your copy is ready for the mail as soon as I get your letter or postal. Address: Jim Rohan, Pres.

The Henyard.

THE EGG-LAYING CONTEST.

The fifteenth week of the contest shows a gain of 397 eggs over the previous week, and the fourteenth week showed a gain of 682, so in the two weeks the egg production has increased 1,079. The production of this fifteenth week was 2,066. Tom Barron's White Wyandottes have resumed their lead in the weekly egg production, after skipping one week. Their output for this week is 49; Dr. J. A. Fritchey's S. C. Reds take second place with a score of 40; and Dearborn & Sharpe's S. C. Reds take third place with a record of 39. Pen No. 9 White P. Rocks from Storrs Agricultural Station laid 38; Dr. N. W. Sanborn's Buff Wyandottes, 38; A. B. Brundage's S. C. Reds, 38, and L. E. Sand's White Leghorns, 38. Tom Barron's White Wyandotte pullet No. 1 laid Sunday and every other day, as did Homer P. Deming's S. C. Red No. 7. Barron's pullet is the one that went broody and did not lay for several weeks; she is trying to make up for lost time now.

Barron's White Wyandottes have a total now of 573; the next highest is Francis F. Lincoln's White Leghorns, their total is 457. This shows Barron to be 116 eggs ahead of any other breeder. His pen of White Leghorns have a total of only 282 at this contest, but at Mountain Grove, Mo., they lead all the other pens of any breed, and at Thorndale, Pa., they lead all the Leghorns, as his Wyandottes lead all the breeds. The Silver Campines have commenced laying, starting off with a score of 13. Every pen in the contest is laying now. The total production to February 13, is 13,922. Below are some of the scores made to date:

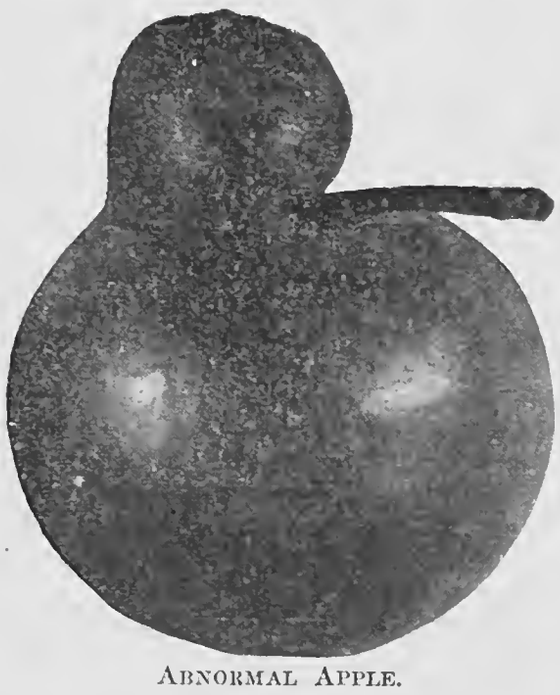
S. C. Brown Leghorn Eggs for hatching, from a good utility strain, at farmer's prices. J. E. WEAVER, Greensboro, Maryland

Abnormal Apple Growth

Fasciation or the lateral growing together of buds or tissues that normally are separate is not an uncommon phenomenon in rapidly growing plants. It is seen most frequently in the stems and fast growing sprouts of the sweet potato, the black raspberry, asparagus and certain lilies when stimulated by intensive fertilization and ample supplies of moisture, but may be found in a wide variety of cultivated plants, though rare in nature. Fasciated stems form wide ribbon-like growths, often with a multitude of small leaves and buds or growing points, which blend together at the edges as

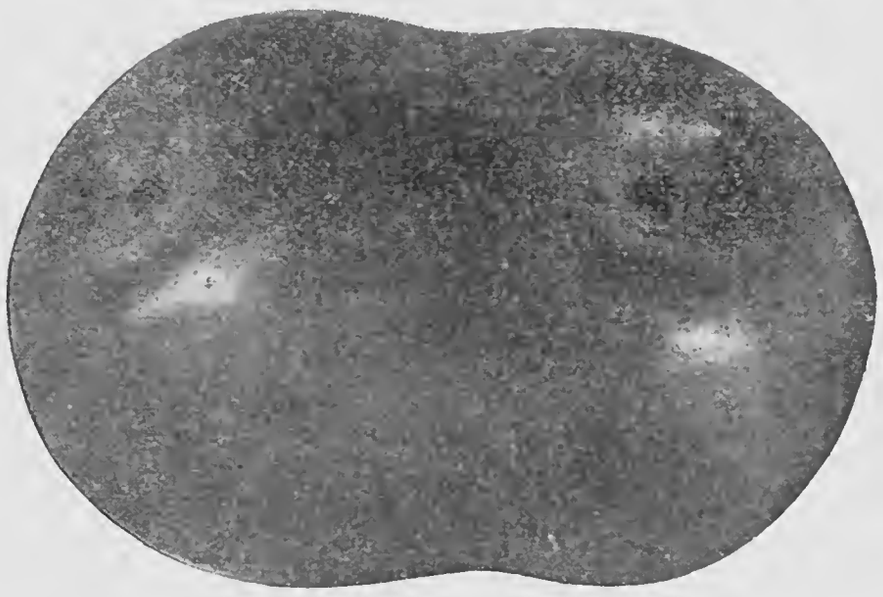


ABNORMAL APPLE.

growth progresses. Such abnormalities are plainly the result of over-nutrition, and contribute nothing to the welfare of the plant.

Presumably every bud, branch, leaf and flower arises from a single growth—all which normally takes the lead in development and its associated cells fall methodically into the proper order to form the new growth. Sometimes it appears as if two or more cells get an even start under special stimulus, which we cannot readily understand, and grow side by side, forming twin or fasciated growths. Thus in lower cut the twin apples have possibly developed from multiple blooms on single stems or pedicels, though close examination might show the fusing or fasciation of two pedicels, each with a single fertile bloom, as in the normal flower. Such monstrosities have no value, but are interesting as showing what may happen when nature is off guard.

The apple or typical pome is a very symmetrical and highly developed fruit,



TWIN APPLES.

with its five-loculed ovary developing into the star-shaped core surrounded with mellow flesh, and is far less given to twinning than the drupes or plum-formed fruits, in some varieties of which it is quite common. Thus the ovary or incipient fruit of the plum, cherry, peach, apricot and almond contains but two ovules, only one of which, as a rule, develops into a seed. Occasionally we find two kernels or two seeds in a pit, as a result of the development of both ovules, and less often a twin fruit with one or two normal pits each with single kernels. Twin cherries and plums are very common in California, where these fruits are grown to great perfection and does not greatly affect the value of the fruits owing to the compact form of the combined growth. In the apple or pear twinning or fasciation if at all common, would prove a great nuisance. V.

SMITH: "Do you believe in the sympathetic influence of music?" Brown: "Sure; whenever I hear an automobile siren I always start into a quickstep."—

Little Points With Big Profits in Potato Growing.

Big profits in potato growing come from attention to little details which the average grower overlooks. To this matter of thoroughness E. P. Smith of Oswego County, N. Y., a recent lecturer at Cornell during Farmer's Week, attributed his success. Mr. Smith ought to know, for he has had to learn the potato game from seed to market.

Ten years ago he came into possession of a farm known as the poorest in the township. His farm experience was very little, the crops for the first year were failures and to cap the climax, his house was destroyed by fire early in the Winter. In the face of all these discouragements and in spite of advice to quit, Smith determined to stick it out and make good or go down fighting.

His first potato lesson was in the matter of deep plowing. The only plow left from the fire was minus a clevis and in his inexperience, Smith turned over the first field knee deep. All his friends told him the land was ruined, but to everyone's surprise, this land gave the biggest yield in the vicinity at digging time. From that time since the land has been plowed 10 inches deep or more. This deep plowing is followed by thorough harrowing. Even after the soil is apparently worked into ideal shape it is harrowed over a few times extra for luck. Sometimes Smith has kept up this harrowing until his neighbors were suspicious of his sanity, but the extra working has always paid.

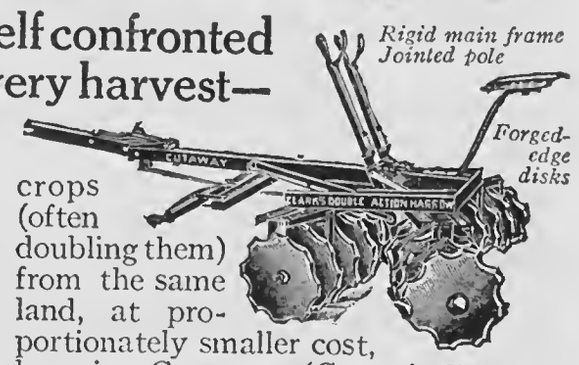
Another detail which receives careful attention is that of securing a perfect stand. Most potato patches have five to 10 per cent. of the hills missing. This means that in a field of 20 acres, from one to two acres are worked and cared for at a dead loss. A perfect stand means attention to the two operations of cutting and planting the seed. Here, the seed is cut so that every portion consists of a good sound chunky piece with one or more eyes, and every poor or questionable piece is thrown out. In planting, every hill is seeded. If the machine skips, it is stopped and the hill planted by hand. Smith claims that it pays well to keep every hill working.

A little detail which many potato raisers overlook is the care of the outside rows. If these are neglected or carelessly trampled in turning there is a loss which amounts to a considerable sum in a large field. Mr. Smith uses just as much care with the boundary hills and rows as with the rest and it is hard to find an injured hill on his whole patch. Another factor which has shown up on the profit sheet is that of seed selection. By choosing the best yielding plants and growing these for seed in a separate plot a high yielding strain adapted to local conditions has been produced. Last season this selected seed gave a crop 30 per cent. larger than that obtained from the ordinary seed.

On this farm spraying, harvesting and every other step in the work receives the same careful attention. If genius is defined as a capacity for taking infinite pains then Mr. Smith has earned the right to be called a genius in potato growing. This thoroughness in little points has brought success, and the determination to make good has been rewarded. Last season's crop from 20 acres sold for over $4,000, with an average yield around 300 bushels to the acre. E. D. V.

How About Your Harvest?

A certain farmer found himself confronted with the same problem at every harvest—

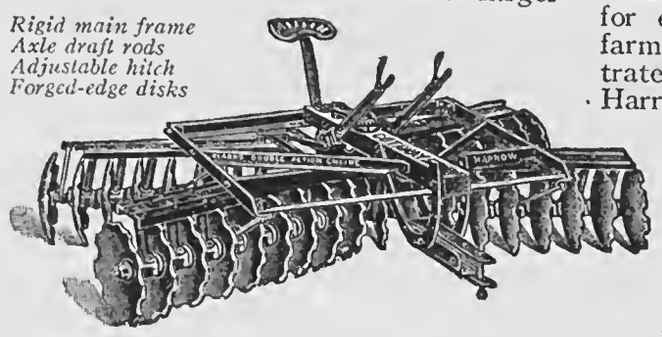


his yields seldom reached the mark they should. His profits were disappointing and, sometimes, distressingly small. He sought for the cause without success—until one day he read a

Cutaway (CLARK)

advertisement about Jim, the farmer whose land produced double that of his neighbor's, simply because he took a look ahead to the harvest when making the first preparation for planting. He followed the advice Jim gave his 50%-farmer neighbor and that very day wrote to us for a copy of "*The Soil and Intensive Tillage.*" In it he read about the chemical and physical properties of the soil, about how plants feed, and about intensive tillage. He learned that he could make much larger crops (often doubling them) from the same land, at proportionately smaller cost, by using CUTAWAY (CLARK) disk harrows. He got an entirely new idea about disk harrows and disk harrowing.

Rigid main frame
Axle draft rods
Adjustable hitch
Forged-edge disks



Do you know how much you lose where there are little hard ridges between the surface and the subsoil in your fields? Often the surface looks mellow and fine, and you are deceived. Do you know how much you lose every year because there is a clumpy strata between the seed-bed and the subsoil? You can stop these losses. CUTAWAY (CLARK) disk harrows pulverize all the soil to the full depth to which they run, and they are lighter draft than other harrows, size for size. There is a style and size for every farmer. In our catalog you will find illustrated and described Double Action Engine Harrows; Double Actions for horse power for both orchard and field work; Corn and Cotton Harrows; one-horse harrows for field, grove and garden; Bush and Bog Plows; Right Lap Plows; California Orchard Plows—in fact, the tool *you* need. Remember, our catalog "*The Soil and Intensive Tillage,*" is free for the asking. Write for it today.

Deep Plowing

Brings the Crop

Here's an example of power efficiency that you should have. Note the hat in the furrow with the foot rule indicating the 12 inch depth. These 4 furrows—all 13 inches wide—would be impractical, if not impossible, with horse power. It's work that calls for the

Leader Farm Tractor

On many farms the Leader has saved its entire cost in one to two years. It's designed for farms of 120 acres to a section or more. Its enormous strength and light weight (only 2½ tons) are secured by building it of the lightest grade heat treated steel. It's used for pulling corn and grain binders as well as plows, harrows, drills, etc. Belt power drives threshers, silo fillers, etc. Double opposed cylinder engine.

You Try it Before Buying

Do as others have—sell 3 or 4 horses and double your farm power efficiency. Write for trial offer—you to be satisfied in every way before accepting. Ask for the Book of Farm Power. Arrange for free demonstration at once. Write today:

HEN MANURE AND CHEMICALS.

What should be added to hen manure, dried with coal ashes, to make a fertilizer for fruit and garden truck, such as tomatoes and melons? H. H.

That is the substance of more than 50 questions about hen manure. This manure varies in quality more than any other, depending on the way it is kept and the sand, ashes, feathers or litter mixed with it. We answer the question therefore in a general way. The litter and coarse part of the manure should be kept separated from the solid parts found under the roosts. We put this litter around trees or shrubs as a mulch, or mix it with the stable manure.

There are many ways of handling the solid portions. The quickest and easiest way is to scrape it up at intervals and spread it at once on the grass or grain or on the ground for the garden. There is not much loss in this, but it is not the most economical way. The following plan suits us best. Keep the droppings under the roosts well dusted with some drying material like land plaster, ground phosphate rock, sifted coal ashes or dry road dust. We consider land plaster best. *Never use wood ashes.*

The object in using these dusty materials is to dry and harden the manure for safe keeping. Fermentation will not go on unless there be moisture and heat. This dried manure is scraped from under the roosts frequently and stored in barrels or boxes in a dry shed. In the Spring the manure will be in the form of hard dry chunks. The object now is to make a fertilizer using this dry manure for what the fertilizer dealers call a "basic" mixture. Grind or crush these chunks as hard as possible. This may be done by beating them with a mallet or heavy spade or grinding in a machine. Sift this through a fine sieve and crush the larger pieces. As with all fertilizers, the finer the manure the better distribution you can make.

Generally speaking, hen manure is from three to four times as rich in plant food as ordinary stable manure. It is strong in nitrogen, but comparatively weak in potash and phosphoric acid. You have doubtless noticed that hen manure used alone gives a very rank and green growth of leaf and stem. The economical use of hen manure means the addition of the mineral elements to "balance" the nitrogen. By drying and grinding the manure we are able to make an even mixture with the chemicals. The most common mixture of chemicals to go with manure is 300 pounds of acid phosphate and 100 pounds muriate of potash. This is mixed with 800 pounds of crushed hen manure and makes a good mixture for drilling with small grain or for using in the hill with corn. When used on grass more available nitrogen will be needed than the hen manure alone will furnish. This we should use for grass as a Spring dressing. 100 pounds nitrate of soda, 1,200 pounds sifted hen manure, 500 pounds acid phosphate and 200 pounds muriate of potash. For garden crops and potatoes we should use 150 pounds each of nitrate of soda and dried blood, 1,000 pounds fine hen manure, 500 pounds acid phosphate and 200 pounds muriate of potash. These mixtures will suit the needs of the various crops and will provide an economical use for the hen manure. There is a chance in this for some of the larger hen men to develop a choice little business of mixing a high-grade garden fertilizer from the manure and chemicals.

Seeding to Cow Peas.

What is the proper method of seeding a field to cow peas? I have a field measuring 25 acres, which I plowed in the late Fall. The soil is of several varieties, ranging from a light sand to a yellow sandy loam, and has not been cultivated in the last four years, being somewhat sour. I expect to use phosphate powder and muriate of potash for fertilizing. Would a three-section tooth harrow be satisfactory for harrowing in the seed, or would they have to be disked in lightly to assure proper covering? K. G.

It would be better to disk the cow pea seed under about three inches or a little deeper, and then smooth the surface with a light harrow. The spring-tooth, however, if set to run deeply will cover the seed well, but we should smooth the surface with a tool like the weeder or a plank drag. When broadcasting cow peas we plan to use five pecks to the acre.

The Spirit of Service

WHEN the land is storm-swept, when trains are stalled and roads are blocked, the telephone trouble-hunter with snow shoes and climbers makes his lonely fight to keep the wire highways open.

These men can be trusted to face hardship and danger, because they realize that snow-bound farms, homes and cities must be kept in touch with the world.

This same spirit of service animates the whole Bell telephone system. The linemen show it when they carry the wires across mountains and wilderness. It is found in the girl at the switch-board who sticks to her post despite fire or flood. It inspires the leaders of the telephone forces, who are finally responsible to the public for good service.

This spirit of service is found in the recent rearrangement of the telephone business to conform with present public policy, without recourse to courts.

The Bell System has grown to be one of the largest corporations in the country, in response to the telephone needs of the public, and must keep up with increasing demands.

However large it may become, this corporation will always be responsive to the needs of the people, because it is animated by the spirit of service. It has shown that men and women, co-operating for a great purpose, may be as good citizens collectively as individually.

Saves hard work

Gardening with IRON AGE Drills and Wheel Hoes

Opens its own furrow, sows accurately, covers and packs the soil, and marks next row.

is a very simple matter—the stand-up, straight ahead way—the safe way for the plants—the most economical way for ground, time and money—the most productive way for good crops—the only way to get a good garden in dry time—the healthiest way for all concerned.

Market gardeners, home gardeners, seed growers, nurserymen, poultrymen, are all interested in these tools.

Women, boys and girls can handle them—many farmers' wives have been able to supply their tables in season with the best of fare, and with little expense or effort, when they could not depend on the men making garden

Ask your dealer to show you samples and write us for booklet:

"Gardening with Modern Tools."

38 styles and combinations

Use of these tools solves three problems:

High cost of living
Fresh vegetables and fruit
Healthful exercise

Sows in drills or hills

BATEMAN MANUFACTURING CO.
Box 102-G GRENLOCH, N. J.

"What I Keep," Said the Farmer, "Is What I Gain"

Even the profits of best crops leak away in repair costs caused through neglect to paint in time.

Exposed house or barn surfaces are big items of expense. Every empty sap cell drinks water like a sponge. Then constant damp destroys the fibre of the wood. Then lumber bills and time lost make you think.

Dutch Boy White Lead

and Dutch Boy Linseed Oil

make a paint that "water-proofs" every pore and seam where damp can enter.

The difference in *saving* is what counts. Tint it any color, mix it yourself or get your painter to do so.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book of House Painting—FREE

Tells how to mix and choose paints of all colors for all surfaces, weathers, paint uses; how to choose colors that wear and look best, how to estimate cost, and amounts of paint used; how to test for purity. Send NOW for Farmers' Paint Helps No. 253.

A Melon and a Peach.

The picture shown here was sent us by Mr. Cecil W. Davis of West Virginia. Last Summer he sent us a sample of the Delmar melon. It certainly was a melon to those who ate it and to the handlers who stand between the grower and the consumer. The shipper, however, got very little out of it except the rind. Our friend, however, sends us this picture to show the comparative size of his melon and also to show what he called "another melon," which he thinks is the real thing. The melon in the picture is all

A MELON AND A PEACH.

right, but as for the other character, we think that is more in the line of a "peach," and a good one at that. Probably this peach is able to make an effective cross between himself and the melon. That is more than Burbank ever claimed to be able to do, and when this crossing has been completed, the melon will be inside of the peach.

Scab on Potatoes.

I enclose sample of the skin of two potatoes grown at different ends of a small plot of ground. The smooth one was at the south end of the plot, and the warted one on the north end; betwen the two ends were 150 hills of corn. What makes the warty condition? I have been told that it was the sting of the earthworm. Why should the trouble be confined to one end of the plot? Is there a remedy? W. W.
Connecticut.

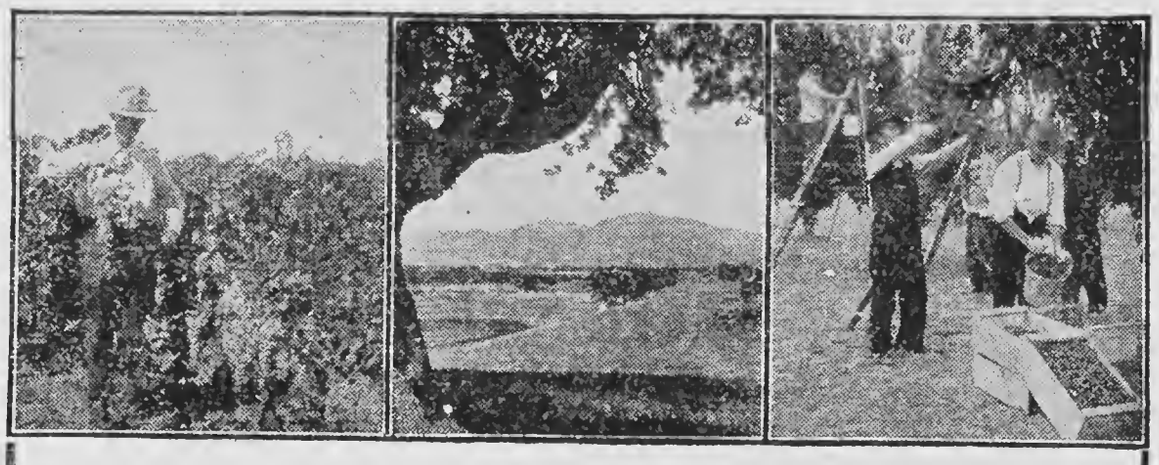
Your potatoes showed the effects of the scab disease. Earthworms do not and cannot "bite" potatoes. The scab is a skin disease spread by a germ which may be found on the seed potatoes or in the soil. Where the tubers are badly marked potatoes should not be planted year after year in the same ground, for these germs will be found there. Growing other crops for a few years will help work out these germs. Planting scabby potatoes for seed will spread the disease. The remedy for this is to soak the seed potatoes in a solution which will kill the germs, but not injure the potato buds or eyes for sprouting. A solution of one pint of formalin in 30 gallons of water will do this. The seed potatoes are put into this liquid for two hours and then dried and cut. For a small lot a tub or barrel will answer. For large lots a tank is used or a barrel of liquid. The potatoes are put into sacks which are let down into the liquid and then hauled out. Powdered sulphur is also good to prevent scab. We would soak in the formalin solution and then use sulphur when cutting the seed, scattered over as the tubers are cut up. This sulphur helps kill the scab germs and also preserves the seed pieces from rotting.

Apple Pomace Around Trees.

I have a large amount of apple pomace, and wish to know if mixed with lime, whether it would be good to put around apple or cherry trees? E. W. W.
Ypsilanti, Mich.

If this pomace is sweetened by the use of slaked lime, it will make a fair mulch for the trees. Do not put it on without liming. There will be trouble if you do. Do not pile the pomace up against the trunk of the tree, but spread it out on the grass or ground about as far out as the limbs extend.

THE clerk of the court addressed the jury: "Well, gentlemen of the jury, have you agreed upon a verdict?" "We have," replied the foreman. "What say you? Do you find the prisoner at the bar guilty or not guilty of the crime?" "We do." "You do? Do what?" "We find the prisoner at the bar guilty or not guilty." "But, gentlemen, you must explain." "You see, six of us finds him guilty, and six finds him not guilty."—Melbourne Leader.



Your Great Chance to get a California Farm is NOW

In the great San Joaquin Valley, California, are chances to-day for money-making in fruit-growing, in dairying, in poultry-raising, that appeal to the man who wants to make his effort count for most.

Your markets are unlimited. There are the hungry big cities of the Pacific Coast, two of which are to have great expositions next year. Thousands of mines and lumber camps never get enough farm products. The rest of the world is glad to pay good prices for California fruit.

You will find a well developed country. You will find good roads and rural delivery. A neighborly, get-together and work-for-the-benefit-of-all spirit makes a success of co-operative effort in getting the profit for the grower.

Ambitious, progressive farmers are wanted to settle this wonderful valley. I know where the opportunities are, and I will gladly point them out. I can save you time and travel, because you need not duplicate the investigations my staff has made.

Our books, "San Joaquin Valley," "Dairying" and "Poultry," will give you a great deal of information. Then if you will write me what more you would like to know, I will tell you. The books are free. So is all the assistance and information which I can give you.

Santa Fe agricultural demonstrators will assist new settlers in selecting the right crops to get best results. One of these men will help you if you wish.

Just say "Send California books."

C. L. Seagraves, General Colonization Agent
Atchison, Topeka & Santa Fe Railway
2209 Railway Exchange, Chicago

A Large Profit Yielding Apple Region

IN Virginia, North Carolina, Georgia and Tennessee, thousands of acres of unexcelled apple lands, capable of returning enormous profits, can now be purchased at extremely low prices. These mountain cove lands of disintegrated rock, mineral and decayed plant formation (the greatest requisites for the production of the finest fruit) can be purchased

From $15 An Acre Up

The large assortment of varieties, extremely low cost for land, the especially favored climate, the abundant rainfall, ample sunshine, excellent air drainage and the fact that 6 to 12 cents per box puts Southeastern fruit on the New York City market, is convincing evidence that this section excels all others as an apple and general fruit growing country. Virginia alone in 1912 produced over 1,200,000 barrels of apples.

Use NATCO Tile—They Last Forever

Farm drainage needs durable tile. Our drain tile are made of best Ohio clay, **thoroughly hard burned.** Don't have to dig 'em up to be replaced every few years. Write for prices. Sold in carload lots. Also manufacturers of the famous NATCO IMPERISHABLE SILO, Building Blocks and Sewer Pipe.

NATIONAL FIRE PROOFING COMPANY, Fulton Building, PITTSBURGH, PA.

PRODUCTS, PRICES AND TRADE.

Wholesale milk prices remain unchanged, $1.81 for B and 10 cents per can less for C. A slight reduction is expected in early March, though this is not certain, depending on the weather and prices for manufactured milk products. The railroads reaching New York brought 17,947,000 cans of milk and 944,000 cans cream during 1913, a daily average of about 2,480,000 quarts.

*

The butter market is well sustained at an advance of one cent over last week's figures. This is partly the result of the snow blockade, which held up considerable stock on the way and made trucking very slow in the city. Choice creamery is now selling at 31 cents, and best dairy, 29 to 30. Imports from Siberia, Argentina, New Zealand and Australia continue at New York, the stock from the two last named countries coming by way of London. The best of this costs about 27 cents delivered here.

*

Receipts of eggs are large and prices on most grades lower. Few fancy white exceed 33 cents, those mixed with small sizes running at 30 to 31, and brown mainly at 29 to 30. Eggs from China are reaching the middle west in commercial quantities. A recent shipment of 36,000 dozen received at St. Louis wholesale at a trifle above 20 cents. These eggs were said to cost not more than one cent each in China.

*

Potatoes may now be imported from Denmark and Belgium, subject to inspection. The Department of Agriculture finds that those countries are now free from the diseases against which the quarantine was made.

*

A cargo of silk from China and Japan, which recently arrived at San Francisco, is on its way to New York. Thirteen cars were required, and its value is $2,500,000.

*

Travellers on sleeping cars who have been annoyed by the revelry of drunken passengers will be glad to know that the custom of making travelling saloons of railroad trains is gradually going out of existence. The New Haven states that after March 1 no liquor will be sold on any of its trains.

*

Returns for several barrels of poultry and a lot of roasting pigs are being held by a New York commission house because the shipper cannot be located. Checks have been made out and forwarded to the only address given, but returned unclaimed. Any shipper whose case this seems to fit may get in touch with his returns by writing us particulars.

*

British spinners who are raising cotton in Africa report a crop of at least 16,000,000 pounds. This is 2½ times last year's yield, and seven times the amount in 1910, when the industry first began to attract attention. The section referred to is Lagos and Nigeria, on the southern coast of the Sudan.

*

I enclose a letter from a New York commission house. They have been selling eggs for five per cent, but have increased the charge to 10 per cent. Have they any right to do this? R.

New York.

The letter states that owing to increased expenses they will in future charge 10 per cent for selling eggs. There is apparently nothing to prevent them from doing this, as 10 per cent is the amount now charged for selling many lines of produce. It is true that rents, taxes and hired help now cost more in this, as well as other lines of business, and from one to two months credit has to be given to many customers, while cash returns are made to the shipper.

W. W. H.

BUFFALO MARKETS.

This is the season when produce commonly begins to become scarce, if at all, but there is a fine supply of it in the Buffalo markets. Not only is there plenty of trenched stuff from near home, but the Rochester district has a surplus, and is also sending in hothouse tomatoes, cucumbers and the like. There is also new stuff from Florida coming in now. As a rule it is all pretty cheap for Winter; spinach retails for 25 cents a peck and string beans, as good as in Summer, for 20 cents a quart (pound). Sweet potatoes, which have retailed at $1.50 a hamper (bushel), have come down to $1.25. Potatoes are again retailing at 85 cents. Farmers are begining to despair of big prices for potatoes and began to sell them before the heavy Winter weather set in. The cold spell ought soon to raise the price if it lasts.

Butter and eggs are again about on a par as to pound or dozen, the retail price being 31 cents for choice, though five cents more is occasionally asked. One difficulty with eggs is that many dealers sell good-looking storage eggs for fresh laid. Poultry is rather high, fowls retailing for 22 cents dressed; turkey, 26 cents; capon, 27 cents, and squab, 65 cents a pair. Rabbits have been quite plenty all Winter at 40 cents a pair.

Apple venders complain that the fruit is hard to get, but they do not sell the western fancy varieties as high as they used to, retailing them at two to three cents apiece in small measures. By the bushel Kings retail at $2 and Greenings at $1.60. They are keeping fairly well. All southern fruits are cheap, which appears to have a depressing effect on apples. Grape fruit is five cents up, and lemons and oranges, 15 cents up. Bananas are very plenty for the season at 10 cents a dozen up, mostly selling at 12 cents. Big pineapples retail for 25 cents. Malaga grapes are 15 to 20 cents a pound. Among new southern vegetables are Florida beets at five cents a bunch; celery at 75 cents a dozen, tomatoes from Texas at 20 cents a pound, Bermuda potatoes at 50 cents a peck. Stuff from Texas is not coming in very good condition. Florida lettuce is 10 cents a fine head; others five cents. Imported Belgian endive retails for 25 cents a pound, but is out just now. It is not much understood here and need not be till it is cheaper. Home-grown vegetables, beets, carrots and parsnips, retail at eight cents a two-quart measure and vegetable oyster at five cents, being very large roots and well kept. Greenhouse radishes retail at two bunches for five cents.

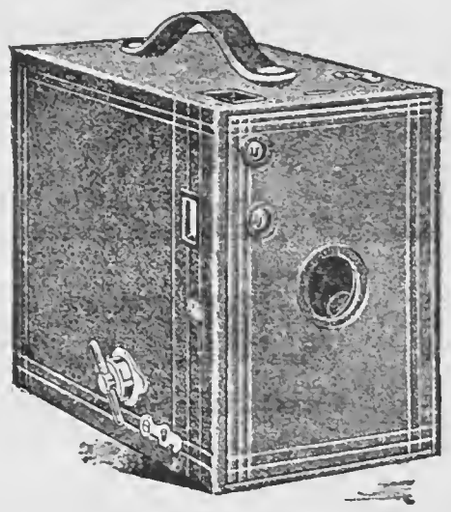
J. W. C.

The country roads are badly blocked—not by innumerable hordes of farmers rushing in their limousines and "sixes" to pay their income tax, as many urbanites and one great New York daily would seem to think—but by the greatest fall of snow that we have had since the big blizzard. The "bear" sign, hereafter, will hold high place in the minds of those who are "weather-wise," for from the very day that he saw his shadow we have had steadily such severe Winter weather as we are wont to associate with our boyhood days. We hope it may also presage one of our old-time early Springs with a fair amount of Summer rain. The past Summer and latter part of the Spring was absolutely rainless in this section, and it was really marvelous that the farmers were able to harvest the 40 or 50 per cent crops that they did. The consumers' dollar problem does not affect us as seriously as it does many, for the consumer at our door takes readily all the general farm products we have to share, which is a very fortunate thing for us, because, with the exception of fruit, during these past dry seasons, it has cost nearly a dollar, and sometimes more, to produce a dollar's worth.

Dutchess Co., N. Y. H. L.

2A BROWNIE

Price, $3.00



JUST the thing you need on the farm to take pictures of stock, crops, etc.—you can use it to advantage in *your* business. It is very simple to operate and works like it's big brother the Kodak. The film cartridge of six or twelve exposures can be put in or taken out by daylight, and you can do the developing and printing yourself without a dark-room, or send it to your dealer. Takes pictures 2½ x 4¼ and you can make as many prints as you want.

Ask your dealer for catalogue or write us and we will mail it free.

EASTMAN KODAK COMPANY,
387 State St., Rochester, N. Y.

For Everlasting Concrete Work

You must have Portland Cement that is pure, live, active and great in binding power. When you build of concrete you build for permanence, and you cannot afford to skimp on the quality of the material you use.

Specify ALPHA and be sure. ALPHA on a bag means something more than 94 pounds of Portland Cement. It stands for exact proportioning of superior raw materials, exceptionally fine grinding, thorough burning, and correct ageing. As a result of this extra care in manufacture, and hourly tests by chemists

ALPHA THE GUARANTEED PORTLAND CEMENT

is stronger, goes further and is cheaper in actual use than ordinary Portland Cements. ALPHA is warranted in composition, fineness and tensile strength to more than meet the U. S. Government requirements and all other standard tests. Be careful, the Government advises in Farmers' Bulletin 481, "to select some well known make *guaranteed* by the local dealer to meet the standard specifications for cement of the U. S. Government."

ALPHA is used by the U. S. Government in important forts, piers, and sea walls, by the greatest railroads (250,000 barrels used in the Pennsylvania Terminal, New York City), and is specified by engineers and architects for important work where cement has to meet the most exacting tests.

Ask the ALPHA Dealer

The ALPHA dealer in every community is a good man to know. He sells ALPHA Portland Cement because he can guarantee it—because he knows it never fails to give satisfactory results. He will tell you how to make *everlasting* ALPHA concrete work. Ask us for the name of the dealer nearest you.

25 Cent Farm Book Sent Free

Our illustrated book, "Concrete in the Country," 112 pages, shows how easy and economical it is to make concrete walks, barn floors, posts, steps, foundations, and 100 other farm improvements with ALPHA, the Guaranteed Portland Cement. Regularly 25 cents; free for the coupon.

The Baltimore Co., Baltimore, Md.

PUBLISHER'S DESK

In spite of previous caution, many inquiries are received in this department which fail to bear the name and address of the writer. We make it a rule never to print the name or address of our correspondents without asking their consent, but we cannot reply to anonymous communications in this column. Those who have made inquiry on any subject, signing only their initials, "A Reader," etc., and who are disappointed in not seeing their letter and answer printed will get prompt attention if they will repeat the inquiry, giving full name and address.

A number of manufacturers have told me personally of the merits of the automatic cigar-making machine. In Baltimore a number of the banks and business men there gave me their word for the honesty and ability of those back of the machine. If this cigar machine is what I believe it is, it will be one of the few great producers like the cigarette machine, the linotype, the shoe machine and the crown cork seal company. However, I would be glad to hear your report on it. W. C. D.

Pennsylvania.

This machine may and may not make cigars. We have not looked it up. We assume it does make cigars, and that it effects a great saving like the other innovations in other fields. From the illustration of it we should assume it could be built for $200 or $300. But we are considering the matter of an investment in the stock of the company.

The company was organized in 1911, with authority to issue $5,000,000 stock in shares of $10 each. This seems to have been a reorganization. Anyway, $2,000,000 of the stock was issued in exchange for patents and stock of another company, and $1,000,000 of the stock was issued for the right of selling in Cuba and Mexico. A Baltimore concern seems to have had a contract to sell the balance of the stock for about 22 cents on the dollar. The assets of the company consist of about $2,500 in cash and about $1,700 in cigars and tobacco, besides the patent rights, sales rights and a few machines. It must be plain that no one can put money into such stock and call it an investment. Some people would call it a speculation, others call it a bet or a gamble. At best you pay your money on the chance that the machine will be successful, and that the business will be honestly conducted, and the profits equitably divided. What happens in most cases is that the money comes easy. The promoters spend liberally, and the company fails, with total loss to all investors. If the machine is worthless that ends it unless the promoters think they can work the scheme all over again. If the machine is a great success, and there are enough small investors to make it worth while, they are frozen out, and afterwards the business is re-incorporated free of the old investors, and the promoters become the sole owners. You may point to one case in a million where this has not happened; but we give you the rule. If any man wants to speculate or gamble for that matter and takes his own risk, we have no right or disposition to dispute his privilege. We give the information and draw the distinctions; you exercise your good judgment.

We have received several inquiries about the Colonial Motion Picture Company. It seemed to us that the promises of quick wealth found in their literature were so romantic that they would defeat their own purposes with a people used to dealing with practical material things. As one practical correspondent puts it, while the row of official names is imposing, and the information rather general that there is money in the picture business, he cannot understand why men who are running the business, and making the money, should go out into the country hunting up perfect strangers to share the promised wealth. But in all such cases you will observe that you make the first remittance of real cash, and in most cases that it is the last exchange of cash, unless you are indiscreet enough to make another.

I have a claim for two cases of eggs shipped to a New York house which were in a damaged condition, and as the Adams Express Company refused to let him examine them he refused to take them. The eggs were worth 35 cents per dozen. The express company say his place of business was closed when they went to deliver them, so they sold the eggs and realized only $15.44, which they offer us. Please see what you can do with them.

New York. S. T. S.

The Adams Express Company made the same report to us and the same offer, which we refused. We called their attention to the discrepancy in the report originally made the subscriber and the actual condition as stated by the commission house, and finally their offer was increased to $18.89, the value of the eggs less commission and expressage.

Phocian M. Daniel, Jr., once President of the Le Roy Realty Corporation, which had an office in Nassau street, was convicted Feb. 16, by a jury before Judge Crain in General Sessions of grand larceny in the second degree. Daniel sold land, representing that it was 15 minutes' walk from the Port Jefferson, L. I., railroad station. Purchasers found it was from five to eight miles away. Daniel bought his land for about $16 an acre and sold it for $19.50 a city lot, employing numerous agents. He had 25 acres, which he divided into 3,000 lots, about two thousand of which were sold, mostly to purchasers who had never seen the property. The complaint which resulted in conviction was made by George W. Cole, an automobile dealer of No. 100 West One Hundred and Sixty-second street, who said that after a talk with Palmer he bought 12 lots and paid $36 down, under an agreement to pay the balance at $1 a month. When he got his deed he decided to see the property. He met Daniel at a roadhouse near Port Jefferson. "Then," Mr. Cole testified, "he drove me in the direction of the Port Jefferson station until we came to some lots. We drove right in, and Daniel pointed and said, 'There are your lots.'"

It developed that the lots which were pointed out were not those on Mr. Cole's deed, and that his property was four miles further from the station. Before he discovered that, he had paid down $178.20.

The above is a fair instance of the Long Island land promoting schemes which people at a distance are asked to put their savings into. If a few such promoters get jail sentences for robbing the public in this way the effect will be wholesome. The above case should serve as a warning to all who may be approached on any such land scheme regardless of whether they hail from Long Island, Florida or elsewhere.

What is your opinion of the "Family Butter Merger?" If you think they should be exposed, I wish you would please do so. I. P.

Maryland.

These butter mergers have been exposed in THE R. N.-Y. a number of times. All work on the egg-beater principle, and by breaking up the globules of the butter they mix milk with it in such a way as to make a greasy product which cannot rightly be called butter at all. Anyone selling it for such in the general market might be subject to prosecution under the Pure Food laws.

I received a catalogue of commercial fertilizer materials from Farmers' United Bone Fertilizer Co. of Reading, Pa., and would suppose from the appearance that it is another name for "Farmers' United Chemical Co." of the same place. It is about the same literature, price per ton; they "pay the freight," etc. The company still owes me about $5 freight on fertilizer purchased two years ago. Last Spring they sent me quotations, order blanks, etc., and I sent them a letter in return stating that I was a "trout" instead of a "sucker." That means when one gets caught the others are a little shy about biting at the same bait. I also told them that about one "sucker" in a neighborhood would be all they could catch without getting a new kind of bait. So I think they changed part of the bait by substituting the words "bone fertilizer" for the word "chemical." I would advise all readers of THE R. N.-Y. to be aware of the above-named company. I. P.

The above letter speaks for itself. It is a matter for comment the number of houses our subscribers complain about that change the name under which they do business—some of these houses complained about have a way of operating under two or three different titles permanently. But we are unable to name a single concern, whose business relations with our readers are satisfactory, who has adopted this policy. The reason is obvious. J. J. D.

SHE wanted to call up the shoe store and ask if a certain style of shoe had been received. She took down the receiver: "What number?" said exchange. "Narrow twos," she promptly replied.—Cleveland Plain-Dealer.

502.6 Bushels Potatoes

From One Acre of Ground

TWENTY DIFFERENT FARMERS in 20 different parts of New England competed the past year in growing potatoes. The crops were widely separated as to climatic and weather conditions. Each one planted, cultivated and took care of his crop in his own way; *but all used*

Bowker's Fertilizers

And No Other Dressing

The winning crop was 502.6 bushels. The average of the twenty crops was 322.8 bushels. The average yield in New England is 131.6 bushels, and for the United States 89 bushels. Our crop-growing contests of the past four years have been so fairly and accurately conducted that they have been accepted everywhere as authentic. Henry Wallace, Editor of Wallace's Farmer, writes: "There is no guesswork about them."

Send for our Book of the Contest. Also tell us what your crops are, and your fertilizer requirements and we will send you our helpful book on Plant Food and our new Illustrated Catalogue.

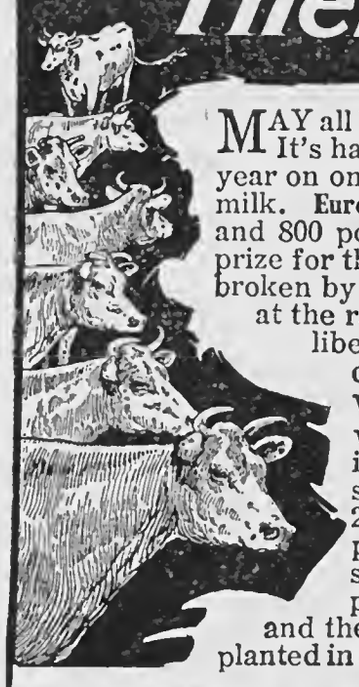
HUSSEY PLOW CO., Box R North Berwick, Maine.

These Seven Cows



MAY all be kept for one year on the product of one acre of land. It's hardly believable. And keeping seven cows for a whole year on one acre goes a long way towards reducing the cost of milk. **Eureka Corn** produced in one year on one acre 70 tons and 800 pounds. This enormous crop won our $50.00 gold prize for the heaviest yield. We believe this record cannot be broken by any other corn, but **Eureka** can still beat it. Figuring at the rate of 50 pounds of ensilage per day, which is a very liberal allowance, this amount will feed seven cows for one year, with enough left over for 261 feeds.

We believe our crop of **Eureka Corn** for 1914 planting will germinate better than 98%. **Eureka Corn** was introduced by us about 25 years ago. It is a white, smooth dent corn, grows the tallest, usually from 16 to 20 feet, has the most leaves and is short jointed. If planted thin, it will yield two and three ears to the stalk. Planting **Eureka Corn** is as good as an insurance policy to any farmer. It grows where other kinds fail and the yield is tremendous. Last season **Eureka Corn** was planted in 45 states and the returns were exceedingly gratifying.

Eureka Corn

Grows Tallest—Has Most Leaves—Greatest Number of Ears

You do not need to plant your whole farm when you can fill a 200-ton silo from 4 or 6 acres with **Eureka.**

The best money you can spend on the farm is for good seed. Poor seed is dear at any price. Good seed is always worth what you pay for it. We're selling **Eureka** at last year's prices. Good seed is going to be very scarce and much higher before the planting season is over. Ask yourself what corn is worth per bushel that will produce 70 tons and 800 pounds. We are not asking you to experiment; we are only asking you to buy seed corn that has been proven by thousands of successful farmers to be the best that money can buy.

CAUTION. Don't accept of any yellow dent or white horsetooth corn as **Eureka.** We received several letters last year from parties who were unable to get their **Eureka** from us and claimed that they had received from other dealers corn marked **Eureka,** which was entirely different from the genuine. **Eureka Corn** shelled is always shipped in our trade-marked burlap bags and ear corn is shipped in rat-proof crates holding 70 pounds. Either buy direct of us or some of our agents who have the genuine. Write at once for catalogue and quotations.

Worms.

1. I have a four-year-old horse that is slightly lame in the right foreleg. The right breast is smaller than the left; when he trots the leg twists between the knee and hoof, throwing the hoof out at the rear. If he stands in stable a couple of days can not notice it till driving about 10 miles. 2. I also think he has worms. What will cure this? J. M. H.

Pennsylvania.

1. Without an examination we are unable to say what is causing the lameness; but you should have the smith so shoe the horse that the hoof will be prevented from twisting. This may be managed by use of sharp calkins and a trailer on the shoe. 2. For worms give one tablespoonful of a mixture of equal parts of salt, sulphur and sulphate of iron night and morning for a week; then skip 10 days and repeat. Mix it in the feed. Do not give iron to a mare in foal. The other ingredients may be safely given. A. S. A.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Farmer with family; particulars first letter. GEO. W. LEONARD, Barberton, Ohio.

WANTED—Married man that understands dairy and poultry on a private place. Mr. ARTHUR BENNETT, Supt., Siegfried, Pa.

GARDENER SEEKS SITUATION—Age 29; good references. S. STEVENSON, R. D. No. 5, Simcoe, Ontario.

WANTED—Widow without children for general housework on farm. SETH M. HIGBY, Wayland, N. Y.

WANTED—Farmer, age immaterial; good home, life job; $20. MORRIS FARM, Bridgeport, Conn., R 4.

WANTED FARM HAND—Married; wages $30; cottage, garden. Connecticut. E. C. W., care R. N.-Y., 333 West 30th St., New York.

WANTED—Reliable farmer for one-man farm. In first letter state nationality, family, terms expected, and give references. Address L. M., care R. N.-Y., 333 West 30th St. New York.

WANTED in vegetable raising and canning business working partner, unmarried; $1,000 capital. STONECROFT FARM, Route 3, Mt. Kisco, N. Y.

WANTED—Reliable man to care for stock on Connecticut farm; must be good milker and have a liking for animals. Give references. C. S., care R. N.-Y., 333 West 30th St. N. Y.

WANTED—A position managing Berkshire hogs. I have just resigned from managing the Swine Department at Anna Dean Farm, Barberton, Ohio. Immediate service. H. D. HARLAN, P. O. Box 114, New Castle, Pa.

PRACTICAL FARMER—Hollander, life experience on general farming, cattle and hog raising, sanitary dairying, machines; college training; small family; wants position. Address A. PAS, 196 George St., New Brunswick, N. J.

WANTED—Married man by year for general farm work; wages $50 per month with house, natural gas, ice and water free; wife to board one or two men winter; several in summer. SUPERINTENDENT, care R. N.-Y., 333 West 30th St., New York.

WANTED—An energetic, married man to manage farm, where another man is kept. Must understand care of horses, colts, cows and chickens; wife for general housework; give references, full particulars and wages expected. CLAYTON, 207 West 55th St., New York City.

FOR SALE—78 acres two miles from Amsterdam, N. Y.; good house, land, water and market; half mile from State road and electric station; telephone connection and rural mail delivery; $150 per acre. O DeGRAFF, Route 5, Amsterdam, N. Y.

PRACTICAL FARMER (American), middle-aged, wants position as superintendent and head farmer; well up in all branches of scientific and practical farming, with life experience; also thoroughly up in construction work, building roads, etc; best references. Address FARMER, care of Siebrecht & Son, 619 Fifth Ave., New York City.

WANTED—Working foreman; young, married; competent to take charge of 60-acre place; seven A. R. Guernseys; chickens; vegetable and flower gardens, lawn and shrubbery; 100 apple trees; wife must be a good plain cook, willing to board help—two or three men—throughout the year; none but fully competent, earnest young man need apply. Write giving references and stating salary to W. W. K., care R. N.-Y., 333 West 30th St., New York.

HEAD TEAMSTER WANTED — A first-class man, capable of operating modern farm machinery, experienced in details of planting, harvesting, and having reasonable appreciation of responsibility. Also man to care for poultry and garden. Apply by letter or in person to JENNINGSHURST STOCK FARMS, Towanda, Pa.

HERDSMAN WANTED—A thoroughly experienced, competent man, to care for high-class herd of Holstein-Friesians. Must be qualified by a good record and proven ability. Also require an assistant herdsman. Buildings, stock and equipment are new and equalled by few. Apply by letter or in person to JENNINGSHURST STOCK FARMS, Towanda, Pa.

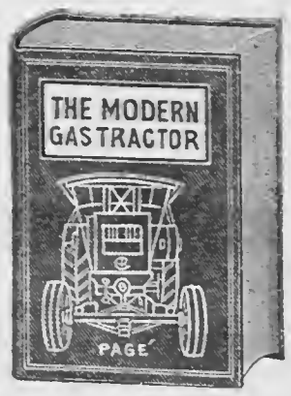
Well located between cities of Rome and Oneida, N. Y.; less than three miles to good town with high school and main line N. Y. Central R.R. Price $7,500. Only half cash required. J. H. FORT, Stone Building Oneida, N. Y.

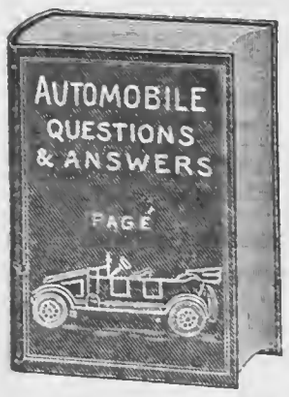
Some Useful Farm Books

THE MODERN GAS TRACTOR. Its construction, utility, operation and repair. By Victor W. Page. 5¼ x 7½. Cl. 475 pp. 204 ills. 3 folding plates.



The latest and most complete work published on farm tractors and tractor power plants, treating exhaustively on their design and construction, and giving complete instructions on their care, operation and repair. It describes all ignition systems, all types of vaporizers and carburetors, latest forms of power plants and installations, clutches, speed changing and reversing gears, all frame parts and their functions, and every recent improvement in tractor and auxiliary appliances. All types and sizes of gasoline, kerosene and oil tractors are fully described. Every phase of traction engineering practice is fully covered.

QUESTIONS AND ANSWERS RELATING TO MODERN AUTOMOBILE DESIGN, CONSTRUCTION AND REPAIR. By Victor W. Page.



This practical treatise consists of a series of thirty-six lessons, covering with nearly 2,000 questions and their answers—the automobile, its construction, operation and repair. The subject matter is absolutely correct and explained in simple language. A popular work at a popular price. Answers every question you may ask relating to the modern automobile. 622 pages. 350 illustrations.

Either of the above two books will be sent postpaid for

A GOOD ROOF

first of all must be "Rain Tight." It must not only be composed of such material as will shed water, bu also not be affected by the blazing heat of summer or the blizzards of a vigorous winter.

Rain-Tight Rubber Roofing

does all this and more. It is made of Trinidad Lake Asphalt—the standard asphalt of the world. It is as near indestructible as any roof can be.

Our brand of **"Perfect Roofing"** is the same as **"Rain-Tight"** with mica flakes added to the surface which make it fire resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

Remember the so-called "cheap roofing" that must be repaired and replaced frequently are dear at any price. You will save money, trouble and eventually expense by buying **"Rain-Tight"** at the start.

Perfect Rosin Sized Sheathing and Perfect Tarred Felt are Best for Sheathing Purposes

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today.

Forage Crops for Swine.

What shall I sow for hog pasture? I have 12 acres for hogs next season, four-acre wood lot in which is a good never-failing spring; adjoining is a four-acre field enclosed with hog fence in which is one acre Alfalfa, the rest of field is in peach trees, in which I will seed some early crop, but what is the best here? The other four acres I have manured and am plowing now. It was in pasture for the last six years, and the sod is very poor and light. The soil is shale and rolling, and not in good shape, but I think the manure does a lot of good. What shall I sow in this field for the hogs? How many hogs can I raise profitably if I buy plenty of mill feed?

Berks Co., Pa. C. R. B.

Forage crops useful for swine may be listed in the following order on a basis of their feeding value: Alfalfa, rape, clover, oats and Canada field peas, mixed grasses. I would suggest that C. R. B. rely largely on rape and clover as a source of green forage with swine during the first year, as it will probably give him the largest yield per acre. A mixture of six pounds of Dwarf Essex rape, and 10 pounds of Sweet clover per acre, might be seeded in the four-acre field early in the Spring, and the animals could be turned in when the rape is about 10 inches high, and it would supply green forage throughout the season. The four acres of sod in my judgment would best be planted with corn, and just previous to the last cultivation of the corn a mixture of eight pounds of rape and 12 pounds of Crimson clover should be seeded per acre, which will make a green forage crop that the hogs can harvest, provided they are permitted to hog down the corn, which is a useful and profitable practice. An acre of rape planted early in the Spring and not pastured until it is 10 inches high will pasture throughout the season from 1,200 to 1,500 pounds of pork live weight per acre.

A grain ration of corn and digester tankage in the proportion of 100 pounds corn to 10 pounds of tankage should be fed to the pigs while foraging, the tankage being best and most economically fed in a thin slop twice daily. From one and one half to two pounds of grain daily for each 100 pounds weight is sufficien to enable shotes and growing gilts to gain rapidly and economically. If C. R. B. has still another area that he wishes to utilize for swine, the following mixture per acre is a very useful one: Oats, 25 pounds, Canada field peas, 25 pounds; Dwarf Essex rape, six pounds; Red clover, 10 pounds; seeded as early in the Spring as weather and soil conditions will permit, the same to be followed in the Fall with a cover crop mixture of wheat 60 pounds and Winter vetch 25 pounds per acre. It is not well to pasture such area until the oats and peas are about nine inches high. This mixture will make a continuous feed until frost destroys the rape plants in the Fall. F. C. M.

A Progressive Cattle Breeder.

The Ohio Agricultural College is responsible for the following:

"Fulton county, Ohio, has a reputation for progress in matters pertaining to dairying. Its many good barns and numerous silos are often the occasion of favorable mention. Good cows with progressive owners are responsible for the well earned reputation. One striking instance of dairy improvement is found in the herd of W. H. Standish. Twenty-eight years ago Mr. Standish decided to cast his lot with the breeders of Holstein-Friesian cattle. Due to the lack of cattle, early operations were necessarily slow and modest, but sound. Mr. Standish developed a rare ability as a judge of dairy animals. Since his start with a few foundation animals, he has purchased some herd sires but few females. The present herd of a dozen cows has in it some wonderful individuals and no common ones. So good has been Mr. Standish's breeding practices and selection that $500 is not an unusual price for a calf from his herd. Every cow in the herd has real dairy conformation, good constitution, phenomenal udder development and the milk production is unusually high. One hundred pounds of milk a day and 30 pounds of butter a week are not uncommon. One individual has produced more than 6,000 pounds of milk in 60 days. Luck has had but a small part to play in the development of this extraordinary herd; rather it has been the outcome of careful selection of breeding stock, elimination of all poor individuals, scientific care, management and feeding."

DE LAVAL
Cream Separator

the most important machine used on the farm

SOME BUYERS OF CREAM separators do not stop to think why their purchase of the best cream separator is of greater importance than the purchase of any other implement or machine of any kind used on the farm, or for that matter anywhere else.

NEARLY EVERY PIECE OF farm machinery is only used a few weeks during the year, if that long, and when it is used simply saves time or labor over some other way, with comparatively little difference between makes of such machines except in design or size or possibly that one is better made than another and so lasts longer and probably costs more proportionately.

THE FACTS ARE VERY DIFFERENT in the case of the cream separator, which is used twice a day every day in the year, and very different as between the De Laval and other cream separators because the use of any other separator or creaming system involves not only the saving in time and labor a De Laval machine would effect but an actual waste in quantity and quality of product a De Laval machine would save.

The Cream Separator the most wasteful or most profitable

THIS IS THE VERY GREAT difference that makes the cream separator the most important of farm machines, the most wasteful or the most profitable, because used so often and involving a waste or a saving every time it is used. This is the reason why there are more De Laval separators in use than any other kind of farm or dairy machines the world over, and more than all the other makes of cream separators combined.

NO MATTER WHETHER YOU have yet to buy a separator or are using an inferior machine, you must be interested in what a De Laval—not a 10, 20 or 30 year old one, but a De Laval machine to-day—would do for you, and that every De Laval local agent will be glad to make plain to you by the demonstration of a machine itself.

IF YOU DON'T KNOW THE nearest De Laval agent, simply write the nearest main office as below.

Two pounds of butter *look* the same at the grocery.

But!—

One may sell for 30c., while the other brings 40c.

The higher priced butter always has the finer flavor. The salt that always brings it out is Worcester Salt.

There is no bitter taste to steal flavor—no dirty salt dust in Worcester Salt. Expert buttermakers use only Worcester. Get a bag. Taste it. Note the pure salty flavor. **Try it.** See how quickly the fine even grains "work in."

Worcester Salt helps you produce the fine flavor that commands high prices.

WORCESTER SALT

The Salt with the Savor

Here's a little book worth reading—"Buttermaking on the Farm." Sent to you free on receipt of your dealer's name and address.

Worcester Salt comes in 28 and 56 pound Irish linen bags—smaller sizes in muslin bags. Your grocer has it. Get a bag.

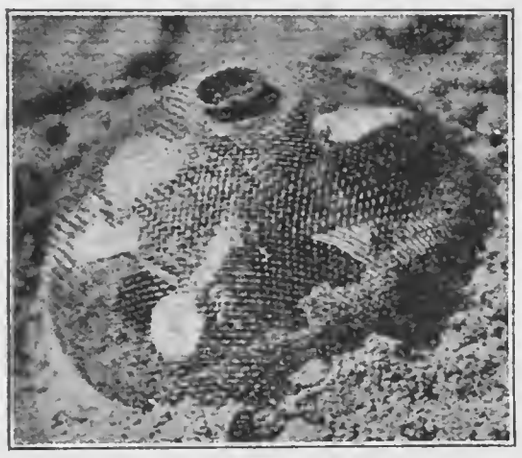
Screen Dome for Melons.

The cut shows a screen dome which I use in growing melons with good success. They are of great advantage in several ways, as they protect the young plants from strong cold winds, also the seed from field mice when planted. They can be purchased from any retailer in hardware for about three cents apiece, if bought in thousand lots. Dip them in white paint and they will last with ordinary care about 10 years. The advantage of white paint over other colors is that you can see the plant very much plainer, as the green foliage and white make a contrast easily seen for quite a distance. For bugs as a preventive they are all one could expect, as they keep all bugs out if ordered with small mesh wire. Those I have are made of common screen wire, and dipped in paint to help close the pores as well as to prevent rust.

They should be placed on the hills just as soon as the seeds are planted, and left there till the plant gets so large they cannot be left any longer. Then they can be placed one on top of another and gathered up, placed under cover for future use. In ordering be sure to get them large enough so they will accommo-



MELON UNDER SCREEN.

date the plants without crowding, they run in all sizes, but I prefer the six and eight-inch sizes.

In the Spring of 1912 I had half an acre of cucumbers covered with them, during a very severe cold wind and hail; I would have lost all without them. After the storm was over they were unhurt and grew finely, netting $50 for being the first on the market. ARTHUR MILES.

A Talk About Pruning.

How will trimming apple trees now affect the coming apple crop? I have been told by a neighbor that the best time to trim is while the trees are in blossom. He claims that if trimmed while in blossom it will not affect the coming crop on an orchard which has not been regularly taken care of. A. R. S.

Binghamton, N. Y.

The effect of pruning depends on the severity of the pruning, the time of the year, the vigor of the tree and the cultivation and fertilization. I judge that the trees are old ones that need considerable pruning. If the trees need it, open up the top or center and remove the intersecting branches and dead wood. Do not remove any more than is necessary to admit the sunlight, as the more bearing surface there is, the less will be the wood growth. It is best to extend a severe pruning over two or more years, so as not to disturb the bearing habit any more than can be helped. If the trees bear in alternate years and the coming season is the crop year, the tree will stand more pruning, if it is the off year very little pruning should be done aside from opening the heads. The crop is easily influenced during the flowering period and for two or three weeks afterwards. Heavy applications of fertilizers or severe pruning, during the dormant season and until the fruit has made some growth, will induce wood growth at the expense of the fruit crop and may cause the young fruit to drop. It would be best to remove all dead wood now, or as soon as possible, and defer further pruning until about the first of July. The wounds will heal more rapidly than if pruned in Winter, and there will be a greater tendency to produce fruit buds for the following year. If any water sprouts are formed after the pruning is done, they should be left until the following Summer, when their removal will help to check the too rapid growth of wood. All cuts should be made close and painted with white lead and linseed oil.

R. B. GILMAN.

Lambert Cherry; Girdling Apple Trees.

1. What about the failure of the Lambert cherry to ripen satisfactorily in Paul Rose's Michigan orchard? We planted 75 Lambert cherries, 100 Schmidt and 100 Black Tartarian at Crystal Lake, Mich. The Tartarians did not do well and I shall have to replace 30 of them. Would you suggest filling in with Schmidt or Tartarian? 2. Can you give details of the girdling process to make trees bear? We have about 30 great Baldwins that have borne little or nothing of late. They are in good shape and I believe have had too much growth. They must be 30 years old or perhaps more. We do not want to damage the trees and have been told it is rather a delicate process.

Ben Avon, Pa. F. B.

1. The Lambert cherry has proved to crack so terribly, in all the eastern sections that I have had reports from, that it is practically worthless there. I positively know from several years' observation that it has been worthless in Northern Michigan. The Tartarian is a good cherry, but the Schmidt is more profitable and from a mere money standpoint I would say to replant with it. The Lambert trees I would rebud to Schmidt. This may require that they be cut back this Spring and the sprouts that will grow out can be budded from Schmidt trees bearing in the Paul Rose orchard, which is not far from the Crystal Lake or even the Glen Lake orchard properties. I am familiar with all that country, having spent two years there when the country was about all wild woods, more than 40 years ago, and I have been returning in the Summers almost ever since.

2. The old Baldwin apple trees would probably bear next year if girdled properly this coming June. There is no danger of doing them harm if a band of bark a few inches wide is taken off entirely around the trunks of each tree. Cut rings with a sharp knife through to the wood and make a vertical slit so as to get the bark started to peel. Strip it off carefully and do nothing else whatever. Nature will soon lay on a new bark and the tree will probably form fruit buds and bear good crops from next year on. H. E. VAN DEMAN.

Hundreds of Fires Start on the Roof

A brand from a burning building, sparks from the chimney, or lightning quickly sets a wooden roof afire.

Kanneberg Steel Shingles

"We Pay the Freight"

Kanneberg Shingles are fire-proof, weather-proof, lightning-proof, heat and cold-proof. Can be laid more quickly than wood shingles and last longer, look better all the time and require no repairs. They do not curl, rot, crack, nor fall off like wood or slate. Many Kanneberg roofs are still in use after 15 or 20 years' service.

Our patent lock joint is absolutely water-tight and allows for expansion. Nail heads are protected from weather.

Kanneberg Steel Shingles are 28-gauge steel, painted or galvanized, and come singly, eight on a sheet, or in clusters on one sheet 5 ft. by 2 ft. We send special nails, free. Every shingle is backed by a money-back guaranty to be up to sample.

Blow Out Those Stumps It's Easy, Quick, Cheap

"Farm Powder is the easiest, quickest and cheapest means of removing stumps," repeated tests have proved. The Minnesota Experiment Station found explosives "blew stumps entirely out, broke them into pieces easily handled, and made clearing easy." Clean up the stump lot in your spare time with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

—Made especially for farm use and sold by dealers near you. Convenient—costs little—no experience needed—no money tied up in expensive tools. Use Atlas Farm Powder to blast stumps and boulders, making idle land pay.

Blast holes for tree planting—the quicker, cheaper way—and watch the trees outstrip those planted with a spade. Use it for subsoiling. Dig ditches with Farm Powder—a row of charges, a spark, and the work is *done!*

Send Coupon for Farm Book—FREE

Our book, "Better Farming," will be helpful to every land owner. Shows how to improve soil, raise bigger crops, blast stumps and boulders, and do all kinds of work with Atlas Farm Powder. Worth money to any farmer. Fill out coupon and get it FREE.

Fred C. McCarty, Auburn, N. Y.

1913 RECORD

Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

Sifting Compost.

The picture given here shows an operation quite common with many good gardeners. This is sifting garden soil or compost, so as to have a fine material for plant boxes, and for use in starting small seed. A screen is used with a mesh suitable for the fineness of soil desired. The soil or compost is thrown upon the screen, and slightly tapped with the fork as it runs slowly down. In this way soil of the desired fineness is obtained, and this may be used in any way that such fine soil is needed. We find too that some farmers are also making use of screens of this kind for use in seeding. This very fine soil after being screened is thoroughly mixed with a small quantity of lime, or with such material as

PREPARING THE COMPOST.

basic slag. Then Alfalfa or grass seed is mixed all through this fine soil, and the whole thing run through the drill in seeding, or it may be broadcast as needed. In this way a perfect distribution can be obtained, and the seed is put in in just about ideal shape.

Horticultural Needs of Southern Ohio.

Conservation of natural resources is or was one of the most important needs of this part of the country, but our fathers were too near-sighted to see it and cultivated our fields too long, so that much of the soil washed away and we have lifeless soil in many of the fields that are left. If cover crops and grasses and clovers had been used in proper rotations and care given to the land in keeping it supplied with humus and something growing to save the fertility all the year round, our lands would now be in far better condition, many fields being practically worthless now that cannot be reclaimed on a paying basis except near a city or some place where high values make it worth while. To keep more fields from becoming worthless, we need to have the soil filled with humus, so as to retain as much water as possible for the feeding crops and to be prepared in case of drouth to prevent serious damage due to lack of moisture in the soil. By so doing there is more growth on the land to decay and make humus and more roots in the ground to prevent washing. With plenty of humus and moisture in the soil the plant food in the soil becomes available or if fertilizers are used one can get better results on soil full of humus and moisture. I do not think the hillsides were intended for cultivation year after year, but to be covered with something to prevent washing and make fertility available. Rotation of crops as practiced on level land is out of the question here. Permanent grass sod seems to be the best thing for our hills and we can grow orchards in in sod, or pasture the land or make hay, or it can go back to woods to be rebuilt for the next generation. If one thinks he must plow and grow a crop, he should get it back in grass or clover or some such crop as soon as possible, or grow a Winter cover crop of Crimsen clover or other clover or Winter hairy vetch or rye, or something to cover the ground and make use of the available plant food in the soil, and to fill the soil with roots to prevent washing. With the decomposition of the plant more humus is made and more plant food is set free and the nature of the soil is improved so as to hold more moisture.

Probably your readers have noticed at the foot of hills or even on the hillside where a good sod is holding the wash as it comes down from above and raises the ground perceptibly, even covering up fences or filling up several feet around trees. It pays to save all you have and hold all you can get as it is washing away. On hillsides one can often get considerable land of another without a deed and hold it too. The thrifty neighbor profits from the careless one when the former is located below him and has a sod to catch the wash. To him that hath shall be given and from him that hath not, even that which he hath shall be taken away. Another case of the admonition given to be thrifty and multiply the talents.

It has been proven by our experiment station officials that the orchards can be improved by using nitrate of soda and acid phosphate to feed the trees, and also that the grass can be made to yield twice as much or more and even bring in kinds that did not thrive before the application. Land that has not been gullied so it can't be used, can be brought back to its former state and made to yield profitable crops and keep up its fertility if rightly managed. Under the wrong kind of management it will go down, it being much easier and quicker to depreciate than it is to appreciate when at the low ebb. U. T. COX.

The Grimes Golden Apple.

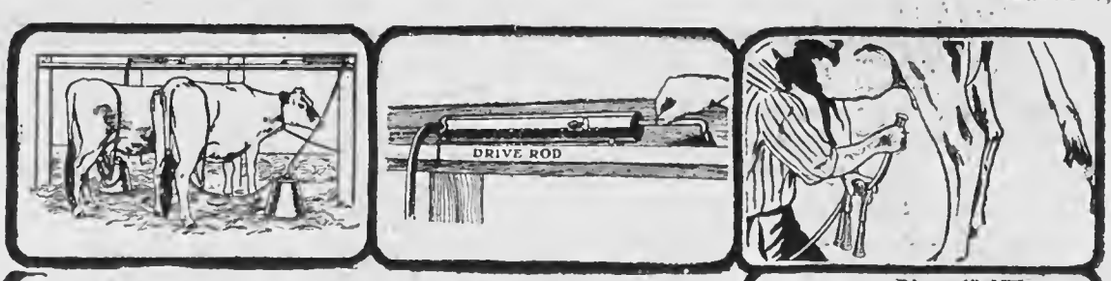
As an industrious member of your Apple Consumer's League I am also joining the ranks of apple producers, and within a short distance of the National Capital am raising many kinds of Grimes Golden apple trees, but that hope is now tinged with sadness. Col. G. B. Brackett, pomologist of the Department of Agriculture, tells me my trees are probably doomed to an early death, as are most trees of that variety that are grafted on ordinary stocks in the eastern section of the country. There is something uncanny about this. Here is a fruit in which nearly all the good qualities exist; pleasing to the eye and the taste alike; just tart enough, and not too sour, nor too sweet; a golden globe of delicate richness, its crisp, juicy flesh dashed with just the right flavor. An intelligent and discriminating friend of mine, who is a great admirer of your paper, says he desired nothing better than to be able to have a Grimes Golden apple on his table nine months in the year.

What is the matter with Grimes trees here? Col. Brackett says that after a few years of bearing period the trunk gets scabby, the bark dies and the tree goes into a general decline. No one knows the cause.

The remedy? Col. Brackett says that for the past two years he has been advising nurserymen to double-work all Grimes trees. Northern Spy on its own root is a good stock, he says. If I had but known that eight years ago, when I was putting out my Grimes orchard.

LINDSAY S. PERKINS.

R. N.-Y.—What is the fact about this? Our own trees of Grimes are worked on wild seedling stocks or on bearing trees. The apples are rather small but fine in quality.



No Vacuum in the Pail

The perfection of the 1914 HINMAN valve chamber makes the Hinman an absolutely noiseless milker. No clicking. The cows stand in perfect contentment. In hundreds of cases the milk flow has been increased where the Hinman is used.

The HINMAN Milker

This new type of valve chamber has visible milk flow, is thoroughly sanitary and easily cleaned—it has positive vacuum control. 2500 cylinders sold in 1913. Every customer claims it is perfection—but the new model is still better.

Every Up-to-date Milker Feature

The Hinman milks one cow at a time with each unit. The following are found only in the Hinman: No vacuum in pail; rapid pail changing; no piping—just a simple drive rod; only two moving parts; simple system of keeping record of each cow.

Free Booklet Will Tell You More

The HINMAN Visible Milk Flow

It's a genuine text book. If there is any feature of the Hinman you do not understand give us an opportunity of telling you about it. Learn the facts before you buy. 60,000 cows milked daily. Agents everywhere. One is near you.

69 YEARS EXPERIENCE BACK OF THEM

Use this Plow in Rough or Stony Land

Our "Little Giant" plow shown below is built especially for use in rough land but gives perfect satisfaction in any soil on account of its excellent turning capacity and ease of handling. It has a capacity of plowing from 5 inches to 7 inches deep and 11 inches to 14 inches wide.

The New Cambridge Plow No. 52

Has soft center steel mouldboard carefully hardened and well polished; a chilled landslide and share; removable chilled iron shin plate; open-hearth steel beam with good clearance; handles of well seasoned white oak well braced. Weight of plow with clevis, 98 pounds. We can furnish either plain or cutter shares, wheel, coulter and jointer as desired. It will do excellent work, however, without any attachments. Write for free catalog giving full descriptions of complete line of the famous Cambridge Plows.

CAMBRIDGE STEEL PLOW CO.
700 Foundry Street Cambridge, N. Y.

The Marlin "Pump" Action .22 Cal. REPEATING RIFLE

You can buy no better gun for target work and all small game up to 200 yards.

No. 20 rifle with plain finish, 15 or 25 shots, $11.50.
No. 29 rifle, $9.25.

Without change of mechanism it handles .22 short, long or long-rifle cartridges perfectly. The deep Ballard rifling develops maximum power and accuracy and adds years to the life of rifles.

The solid top is protection from defective cartridges—prevents powder and gases from being blown back. The side ejection never lets ejected shells spoil your bead and allows quick, accurate repeat shots. With simple take-down construction, removable action parts,—least parts of any .22,—it is the quickest and easiest to clean. Just the gun you want! Ask any gun dealer.

The 128 page *Marlin* catalog will help you decide what rifle best suits your individual desires. Send 3 stamps for it today.

Treating Decay in Squash.

My Hubbard and Boston marrow squashes are packed in straw upstairs in the barn, and are keeping nicely, but when I put them away several were starting to rot, some having rotten spots in them as large as a silver dollar. This condition may have been due to bruising. Anyway the thought occurred to experiment and try to check that rotting. So I cut out with my pocket knife all the rotten flesh, making as smooth a cut as possible, and rubbed in well a dry powder composed of equal parts of air-slaked lime and sulphur. Then I packed these squashes away with the rest, and after two weeks there is no sign of a continuance of the rotting process in the treated spots, while other squashes, purposely left untreated, have continued to rot. While I may be a little premature with my report, I make it at this time to give others a chance to use the process while the "going is good."

Washington. J. G. P.

Cider Vinegar.

One year ago last Fall, I manufactured from hand-picked apples about 40 casks of cider, and put it in storage in the basement of a building in a village, so that it could be near the shipping facilities, thinking perhaps while it was stored, it would make good vinegar. It has been there a year and three or four months, still it is not good vinegar. I cannot conceive why it has not turned to vinegar long before this time. I wish you would tell me what I shall do to make it into vinegar quickly? J. S.

Detroit, Mich.

Cider kept in a cool cellar is likely to be very slow in making vinegar. A little heat, 70 degrees or upwards and aeration are needed to hurry it along. If you can get some of the ferment found in natural vinegar, commonly called "mother of vinegar" a little added to each barrel will hasten the process still more. In commercial operations the cider is sometimes allowed to run slowly from one vessel to another through a series of wood troughs, thus giving it extensive exposure to the air. Under the circumstances you name it will undoubtedly be inconvenient to handle the cider as suggested, and the simplest plan may be to test a gallon or two by putting it in a stone jar, set in a moderately warm place, and stirring frequently with a stick. This will give some idea of the amount of heat needed to complete the work.

Right of Tenant to Yearly Crop.

A rents a cottage and two acres of land from B, on a lease of three years, and pays six months' rent in advance; the lease runs out and B. agrees with A to pay six months' rent in advance just the same as A has been paying all the way along. If B sells this farm will they have to give A six months' notice to leave? A has strawberries and all kinds of fruit planted on this two acres of land and A is a nurseryman buying and selling these goods. Can the purchaser of this farm take possession of these goods without paying for them? P.

New York.

Your tenancy seems to be one from year to year, with payment of rental in half yearly instalments, and no notice to quit need be given you at the expiration of the year by your landlord.

"When a tenant for a year or for one or more years holds over after the expiration of his term, without any express agreement, but with the assent of his landlord, the law implies that he holds the premises upon the former terms for another year; hence he may be turned out of possession summarily without any previous notice at the end of any year he so holds over, because his term, which the law fixes for him, then expires and he knows without notice that he cannot continue in possession longer unless he has permission from his landlord. No notice to quit is necessary in such a case. The rights and duties between landlord and tenant are correlative and reciprocal, and the rule which dispenses with the landlord's notice to quit where with the landlord's notice to quit where the tenancy expires at a fixed period because either so limited by the agreement of the parties in the lease or by law, also makes unnecessary any notice by the tenant of his intention to terminate the relation."

As to your right to remove your nursery stock, which in this case are termed "emblements," you know when your lease is to expire (that is, at the end of the year) and you must remove all of your trees, bushes, etc., before you quit possession on the termination of your lease or the title will vest in the owner of the property. The right to take away what is termed "emblements" (that is, growing yearly crops) is only given to a tenant of an estate of uncertain duration. It would be well for you to come to some agreement with your present landlord, that in case he disposes of the property you may have time to get away your plants.

Prolific Grain.

The Colorado Experiment Station does some mighty figuring on grain production—as follows:

Suppose all the wheat in the world were to be suddenly destroyed with the exception of one grain. If all the wheat produced each year were planted, how long would it take starting with this one grain to again equal the present world's production. The world's production of wheat is at present about 4,000,000,000 bushels a year. The following table shows that with only an average grain to start from it would take only fifteen years to again supply the world with wheat.

.....	0.0012 oz.
1 yr.....	0.0132 oz.
2 yr.....	0.1452 oz.
3 yr.....	1.5972 oz.
4 yr.....	1 lb., 1.6 oz.
5 yr.....	12 lb., 1.3 oz.
6 yr.....	132 lb., 13.8 oz.
7 yr.....	24 bu., 53 lb.
8 yr.....	273 bu., 43 lb.
9 yr.....	3,014 bu.
10 yr.....	33,154 bu.
11 yr.....	364,694 bu.
12 yr.....	4,011,634 bu.
13 yr.....	44,127,974 bu.
14 yr.....	485,407,714 bu.
15 yr.....	5,339,484,854 bu.

The initial weight of 0.0012 ounces for a single grain is the average of 10,000 grains; 1,000 grains were selected at random from each of 10 common varieties of wheat.

THERE was recently haled into an Alabama court a little Irishman to whom the thing was a new experience. He was, however, unabashed, and wore an air of a man determined not to "get the worst of it." "Prisoner at the bar," called out the clerk, "do you wish to challenge any of the jury?" Whereupon the Celt looked the men in the box over very carefully and with a skilled eye. "Well, I tell you," he finally replied. "Oi'm not exactly in trainin', but Oi think Oi could pull off a round or two with that fat old boy in th' corner."—Lippincott's

Ironclad TRADE MARK

Wins in the Two BIGGEST HATCHING Contests Ever Held

Why take chances with untried machines when for only $10 we guarantee to deliver safely, all freight charges paid (East of Rockies) BOTH of these big prize winning machines fully equipped, set up ready for use? Why not own an Ironclad—the only incubator that has for two years in succession won in the **greatest hatching contests ever held.** In the last contest conducted by Missouri Valley farmer and Nebraska Farm Journal, 2000 machines were entered, including practically every make, style and price. With 140 egg Ironclad—the same machine we offer with Brooder, freight paid, for only $10, Mrs. C. F. Merrick, Lockney, Texas, hatched 148 chicks from 148 eggs in the last contest.

140-EGG Ironclad Incubator

GALVANIZED IRON INSULATED BOARD REDWOOD ASBESTOS

Don't class this big, all metal covered, dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap tin or other thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications. Genuin California Redwood, triple walls, asbestos lining, galvanized iron covering. Large egg tray, extra deep chick nursery—hot water tank heat, copper tanks and boiler, self regulator, Tycos Thermometer, glass in door and many other special advantages fully explained in Free Catalog. Write for it TODAY or order direct from this advertisement.

5-Year Guarantee

Both for $10 Freight Paid East of Rockies

30 DAYS' FREE TRIAL
Money back if not satisfied.

140 Chick Brooder

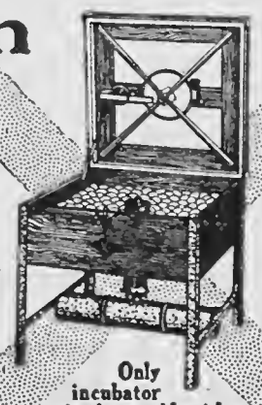
IRONCLAD INCUBATOR COMPANY, Box 121, RACINE, WIS.

One Gallon of Oil

Think of the money saving! Only one gallon of oil for a hatch. Others require five gallons. X-Ray saves you 75c to $1.25 on every hatch.

THE X RAY

Outhatches any other because it is the only one with lamp rightly placed. Distributes heat evenly to every part of egg chamber. This great improvement patented. We pay the freight.



Only incubator in the world with a heating plant like this.

One Filling to Hatch

Think of the work saving! Other incubators have to be filled every day—21 times during hatch. X-Ray heat is automatically regulated.

Incubator

Send for FREE Book No. 32. It tells about the X-Ray, which is bringing success to thousands. X-Ray brooders give chicks best start. Write today.

Carbon Dioxide in Brooder.

I claim that in brooding chicks in a lamp heated brooder the lamp fumes cause a gas which is called carbon dioxide. My friend says I am wrong; it is not carbon dioxide, it is monoxide. He further says that carbon dioxide is a gas formed from the breath from man or chicks. Who is right? J. A. M.

New York.

Both carbon monoxide and carbon dioxide may be found in air vitiated by products of combustion, though the latter appears in much the larger quantity. The amount of carbon monoxide present is largely dependent upon the perfectness of combustion. It is a much more poisonous gas than carbon dioxide, and is fatal in any considerable amount. It is given off in considerable quantities in the fumes of burning charcoal; in such quantities, in fact, that a favorite method of committing suicide in France has been to build an open fire of charcoal in the room and inhale the gas. Gas escaping from a coal-burning stove contains 6.75 per cent. of carbon dioxide and 1.34 per cent. of carbon monoxide. Carbon dioxide is also, as your friend says, a product of respiration given off in the breath of animals. M. B. D.

Age of Hens.

Is there any way I can tell the age of my hens by their appearance? I wish to thin out my flock by disposing of the old birds. How can I tell which they are?

Bedford, Mass. G. P. D.

There is no way of telling the age of fowls, though pullets may usually be distinguished from old fowls by the brighter color and greater smoothness of their shanks, the slight development of their spurs, their smaller combs, their somewhat smaller size and weight, and their general appearance of freshness as compared with old hens. An old hen usually has pale and more or less rough shanks, and frequently well developed spurs, they are usually considerably heavier also than young fowls, having a tendency to take on fat as age increases. There is also a general appearance of age evident to one accustomed to handling fowls, but difficult to describe. M. B. D.

Infertile Eggs.

Is there any way to tell an infertile egg before you put it in the incubator? Is there any way to tell the sex of an egg? M. S.

Florida.

There is no way of detecting infertile eggs before opportunity has been given for development of the germ by incubation; nor can the sex be distinguished. Ability to do these two things would be worth thousands of dollars annually to poultrymen, but the very nature of embryonic development makes it impossible. M. B. D.

Hen's Control of Laying.

Judging from his picture and the tone of his answers to queries, Geo. A. Cosgrove is a fine fellow and I'd like to know him. He's human, however, and does not seem to have learned the difference between a *conclusion* and a *fact*. He arrives at conclusions and states them in his letters as facts. He states that the hen at times has the power to arrest the development of an egg, and she need not lay another until she desires to. Desire pre-supposes will power. I'd give considerable to know the process which was followed in arriving at the *fact* that the hen does just as she likes about laying eggs. Tom Barron's hens must think a lot of him, and they must have found out that he wants to come out first at every contest. G. H. S.

Thanks to G. H. S. for his complimentary remarks about myself. He seems to be somewhat mixed about "conclusions and facts," or rather about my statement of them. I have tried the experiment many, many, times, of taking a laying hen out of my flock and shutting her up in an exhibition coop in my feed house. Usually she would lay one egg, sometimes two, then not another egg in a week or more. That was the "fact." Now, from this "fact," many times repeated, I came to the "conclusion" that the hen had the power to cease producing eggs at will. I never stated that the "conclusion" was a "fact;" only that it was my belief. Everyone who has transferred a flock of poultry to a different house, knows that the *usual* effect is a *loss in egg production*, for a week or so, until they get used to the house and it feels like home to them. But occasionally the new house is so much pleasanter that the effect is an almost immedite *increase* in the output of eggs. What does G. H. S. think is the reason for this difference, if the will, caprice, or pleasure of the hen, has nothing to do with it? Is it the *shock to the nerves* of being separated from its mates, and transferred to unwonted surroundings, that causes the cessation of egg production? Why is it that part of the pullets at the contest at Storrs, stop laying after the first day or two, while others keep right on laying?

Does a hen stop laying because she has become broody; or does she become broody because she has stopped laying? Does the hen's *will* have anything to do with it? Hasn't G. H. S. seen hens whose "will" in the matter of broodiness was mighty hard to overcome? Well, we'll call it "instinct" instead of "will" and let it go at that. But I hope Mr. G. H. S. will learn to separate my "conclusions" from my "facts."

GEO. A. COSGROVE.

Facts About the Laying Contest.

I have been reading from time to time of the egg-laying contest, but lack information as to its methods. Will you tell how it is governed. Are the hens cared for at one place, and given some kind of food? When you speak of Tom Barron's Leghorns, does it mean they were raised in England? How do you account for the strain being larger than the average U. S. Leghorns? J. D. M.

Oregon.

Replying to J. D. M., I would say that there are 50 houses 12x12 feet strung along in five rows. The houses are about 25 feet apart in the row, and the rows about 50 feet apart. Each house is divided in the middle by a partition running from front to rear; part of the partition being made of wire netting, so as not to hinder free circulation of light and air. The houses are about 7½ feet high in front and 4½ feet in back. There is a door at each end of the front, and the space between the doors is boarded up from the ground for about three feet. The rest of the front is open, covered with wire netting only, except that there is a muslin curtain to drop inside when driving storms or extreme cold make it advisable.

For the first two contests, five hens or pullets were put in each part, this year 10 are housed in each part, 20 birds to a house. All the birds are fed the same kinds of food, but the quantity fed is governed somewhat by the judgment of the attendant. If, on kicking over the litter, feed is seen in plenty on the floor, the feed hopper will be kept closed until that is consumed.

When we speak of Tom Barron's birds—Leghorns or Wyandottes—we mean birds that were hatched and raised in England and shipped over here to the contest plant. As to the "strain" being larger, too much emphasis has been laid on that point; more than the facts warrant. There are plenty of other Leghorns in the contest fully as large as Barron's. Barron's Leghorns average about four pounds in weight. The English poultry fanciers have bred for larger birds, so that show birds are often one pound or more heavier than the average American-bred Leghorns; at least that is what I have been informed. Mr. Barron thinks this increase of size is an error; he says that his best layers are nearly always the smaller birds. I have noticed the same thing in Wyandottes in my own yards. And in this connection it is interesting to note that the best layer in the contest just closed at Mountain Grove, Mo., was a Rose Comb White Leghorn pullet that weighed only 2¾ pounds. She laid 12 times her own weight, in eggs. The eggs had to be of marketable size, or they were not counted. When chicks from vigorous stock are hatched early and fed all they can eat, and have proper surroundings and good care, the tendency is to increase of size. I raised a White Wyandotte hen that weighed just 10 pounds; three pounds above the proper weight, but in the same flock was a "bum" looking Wyandotte—speaking from a fancier's standpoint—less than five pounds in weight, that would outlay the big one two to one; in fact was about the best layer I ever owned. GEO. A. COSGROVE.

Corncobs for Litter.

1. I intend breaking up corncobs into pieces about an inch long and then scattering them about two or three inches deep for litter for the chickens to scratch in. Is there any fault to be found with my idea? Would it hurt the chickens' feet or be unsatisfactory in any way to your mind? 2. I keep the Cornell mash before my chickens all the time, and feed them cracked corn and wheat nights and mornings. How much would you feed to each 100 birds, night and morning, and how much of each, cracked corn and wheat would you use? I have about 250 S. C. W. Leghorns and feed them six quarts (three corn and three wheat) mornings, and 10 quarts (four wheat and six cracked corn) evenings, also scatter about three quarts of buckwheat to them at noon to keep them busy. Can you suggest any improvements with my grain feeding, as to quantity fed or quantity of each used? W. J. L.

Middletown, N. Y.

1. Corncobs do not make an altogether satisfactory litter, though broken up as you suggest, they might answer the purpose in the absence of anything better. They are not good absorbents and soon become filthy and are very disagreeable under foot. Straw, leaves, cut corn fodder, or similar soft, absorbent materials are superior. 2. The only improvement in your rations for hens that I would suggest is the addition of oats, if they are available. Your method of feeding is good, and you have probably adapted the quantities to the needs of your fowls. The Cornell Station suggests that the fowls should eat about half as much dry mash as whole grain, by weight, and that the amount of mash eaten be regulated by limiting or increasing the amount of whole grain given. M. B. D.

I Will Tell You How to

Make Poultry Healthy
Make Hens Lay
Make Chicks Grow

GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

U. S. Dispensatory
Medical Colleges
Noted Veterinarians

all certify the ingredients of

Dr. Hess Poultry Pan-a-ce-a

to do just what I claim for them.

Nux Vomica. A nerve tonic.
Quassia. A bitter stomachic and appetizer.
Carbonate of Lime. An antacid and shell-forming.
Hyposulphite of Soda. An internal antiseptic.
Iron (Sulphate). A blood builder.
Iron (Red Oxide). A blood builder.
Potassium Nitrate. An eliminant.
Sodium Chloride. An appetizer and cleanser.

Under the supervision of Dr. Hess (M. D., D. V. S.) the above is carefully compounded and blended with just enough cereal meal to make a perfect mixture.

The crying need of the poultry raiser right now is healthy, fertile eggs for hatching. Mating time is the time of all times that poultry need a tonic and internal antiseptic to put them in the pink of condition—free from disease. Then you get healthy, vigorous chicks that stand a far better chance of reaching maturity. Your hens should be toned up and in the pink of condition right now. The egg organs should be active and responsive, the appetite good and digestion likewise; and let me remind you of one thing before the chicks do come—more than one-half the yearly hatch succumb to Gapes, Leg Weakness, Indigestion and Lice, and most of these can be avoided.

Being a doctor of medicine and doctor of veterinary science, twenty-five years ago I combined science with poultry culture. I have learned what poultry need to make them healthy; what hens need to make them lay, and what your chicks need to help them along to robust henhood. And now I urge you to start right in and feed your flock my prescription—

Dr. Hess Poultry PAN-A-CE-A

Not a Stimulant, but a Tonic

In this scientific poultry preparation I have put every ingredient that my twenty-five years' experience tells me poultry need to make them well; that a hen needs to make her lay; that chicks require to make them grow. It cures Cholera; an excellent constitutional treatment for Roup; cures Gapes, Leg Weakness, Indigestion and the like. In my left hand I hold the formula of my Pan-a-ce-a, showing every ingredient, what each ingredient is for and certified to by the U. S. Dispensatory—one of the world's greatest authorities.

I absolutely guarantee that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy—will tone up the dormant egg organs and compel each hen to lay regularly—help chicks grow—get fertile eggs for hatching and shorten the moulting period.

So sure am I that my Pan-a-ce-a will pay you and pay you well, that I want you to take the coupon in the right-hand bottom corner of this page to my dealer in your town and he will give you a trial package absolutely free of charge. I have also authorized him to furnish you with enough Pan-a-ce-a for all your poultry, and if it does not do all that I claim, return the empty packages and get your money back.

Remember this, Dr. Hess Poultry Pan-a-ce-a is never sold by peddlers, but only by reliable dealers whom you know. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West.

Don't fail to get your trial package—it's free—take the coupon to my dealer in your town. If no dealer in your town, send us 5c in stamps to pay postage, give us the name and address of your dealer and we will send the trial package direct.

Dr. Hess Stock Tonic

Your stock need this tonic and laxative conditioner now. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it badly just now to prepare them for the heavy milking season ahead. Dr Hess Stock Tonic makes all stock healthy—keeps them toned up and expels worms. Sold under a money-back guarantee. 25-lb. pail $1.60; 100-lb. sack $5.00; smaller packages as low as 50c. Except in Canada, the far West and the South. Send 2c for my *new* free Stock Tonic book.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

Dr. Hess & Clark
Ashland, Ohio

Address

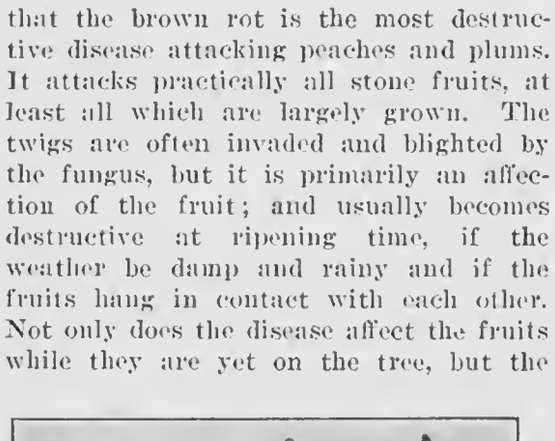
Please hand bearer of this coupon a trial package of Dr. Hess Poultry Pan-a-ce-a absolutely free—to feed 12 hens for 2 weeks. Also give bearer my free new poultry book.

FUNGOUS DISEASES OF STONE FRUITS IN THE MIDDLE WEST.

PART I.

It is hardly to be claimed that the relative importance of the stone fruits as orchard crops is as great in the Middle West as in the more thickly settled East; but it is not, therefore, to be concluded that it is inconsiderable. In fact, the opposite is the case. These crops assume a large place as a source of revenue on many farms, and this is especially true in the vicinity of large towns and cities. The success of these crops, however—peach, plum and cherry—is very often greatly curtailed by one or other of some four or five diseases which are prevalent in this section. It will be the aim here to discuss rather briefly the appearance, mode of attack, etc., of each important disease, and to indicate what seems to be the most effective control measures.

BROWN ROT.—There is no doubt that the brown rot is the most destructive disease attacking peaches and plums. It attacks practically all stone fruits, at least all which are largely grown. The twigs are often invaded and blighted by the fungus, but it is primarily an affection of the fruit; and usually becomes destructive at ripening time, if the weather be damp and rainy and if the fruits hang in contact with each other. Not only does the disease affect the fruits while they are yet on the tree, but the



MUMMIED PLUMS HARBORING BROWN ROT.

rotting of an infected specimen progresses after picking, and the decay is thereby induced in sound fruit which may be in contact with it in the basket. The disease first shows up as a brownish and softened area, usually circular in shape, which increases steadily in size until the whole fruit is involved. Soon after this, or even before, small gray mold-like tufts appear on the older infected portion; and if these be rubbed or touched, a gray powder comes off. This dust is composed of the Summer spores of the fungus, Sclerotinia fructigena, which causes the trouble. These spores germinate readily and spread the disease with extreme rapidity.

The fungus winters in these same infected fruits. Many of them fall to the ground, others dry up and cling to the tree. The picture here given shows a number of such plums which were picked from the tree and photographed in January. When Spring comes, the fungus threads in these "mummied" fruits produce another crop of spores, and the disease gets started for another season. Then beginning with the cherries, following with the plums, and ending with the late peaches, it works steadily at destroying the crop when just ready to be picked. Estimates of the damage range from practically nothing to 90 per cent. or even 100 per cent. in different seasons and localities. It is customary to take such high estimates as the latter with a grain of salt, but as the writer has himself seen 50 per cent. or more of a crop destroyed in a few days of warm, wet weather, he is not inclined to make the grain of salt unduly large. The trouble is almost impossible to stop if it gets a good start.

Fortunately, though, it can be prevented to some extent, if taken in time. One measure for this is to destroy affected fruits, since as has already been mentioned, it is by these that the disease passes the Winter. They should be cleaned from the trees and ground and buried deeply, or burned. The severity of the disease can be lessened by thinning until peaches are about six inches apart and until plums do not touch. This should be supplemented by picking and destroying affected fruits as they appear, so that nearby fruits may escape. This would not involve as much extra labor as might at first seem, because most of these diseased specimens must be handled at picking time anyway. Furthermore, the thinning of peaches is a highly profitable practice quite aside from any consideration of the brown rot, because of the increased size and quality of the fruit resulting.

The second measure for the control of this condition is spraying. The first spray should be boiled lime-sulphur diluted to test 45 to 50 deg. Beaume, applied before the buds open, preferably in March. This is to prevent twigs and blossom infection, and to destroy any hibernating San José scale. For plums and cherries, but not for peaches, follow with 4-6-50 Bordeaux and arsenate of lead, two pounds of the arsenate to 50 gallons of Bordeaux just after the buds burst, again just after the petals fall, and again four or five weeks before the fruit ripens. The last two applications of Bordeaux should contain only half the standard quantity of bluestone in order to avoid leaf injury. For peaches use 8-8-50 self-boiled lime-sulphur with two pounds of arsenate of lead to 50 gallons of the spray, the same as mentioned above, four or five weeks after petals fall, and again three or four weeks later, except for early sorts. For late varieties, a final application should be made four or five weeks before ripening. The use of the arsenate of lead is for the control of curculio. The control of the curculio is doubly important, because it causes a two-fold damage. There is a direct damage, due to the fruit actually destroyed by the insect; and there is an indirect damage due to the method of spread of the brown rot fungus. It has been found that brown rot attacks usually originate at curculio injuries, and that spraying for brown rot alone will not control the disease, whereas if the curculio be controlled, the treatment for brown rot can be made successful. The inclusion of the arsenate of lead in the spray is important, therefore, as a measure for the control of the fungus as well as for the prevention of insect injury.

PEACH LEAF-CURL.—The peach leaf-curl, like the black knot of plums, is a disease which is exceptionally well named, because of the accuracy with which the name suggests the peculiar curled, wrinkled leaf deformations which are the most typical symptoms of the trouble. The affection, however, is more than a leaf trouble; it is also a twig, flower, and fruit disease, and as such is more important than many suppose. The effect in such cases is to blight the structures affected, although many of the twigs often recover eventually. The cause is a fungus, Exoascus deformans, which grows among the tender young tissues. It passes the Winter as spores. Some of these spores are lodged on and among the scales of the dormant buds. When the buds germinate the young leaves and other structures become infected and the characteristic symptoms follow. Later in the season the curled leaves turn brown and fall from the tree. A cold damp Spring is conducive to a severe attack. After such a Spring, neglected peach trees often become defoliated to a very serious degree. If the buds open and the leaves develop during warm and comparatively dry weather, however, the attack will be much lighter and perhaps negligible. The remedy is prevention, and consists in preventing the spores on the bud scales from infecting the young parts. The disease cannot be controlled after it gets a good start. Spray while the buds are yet dormant with Winter strength of Bordeaux, or boiled lime-sulphur—and be sure not to put off the job until the buds are opening. This spraying, as has been suggested, will also help with brown rot and prove exceedingly rough on the San José scale.

C. A. LUDWIG.

Rock Bottom Prices Roofing for a Lifetime

You can't prevent lightning—you can't prevent ordinary roofs from catching fire from flying embers—but you *can* have a lightning-proof, fire-proof, rust-proof and rot-proof steel roof—one that lasts as long as the building stands. Always beautiful—never needing painting or repairs. Before investing in any kind of roofing, you should learn all about the *one* BEST roofing made.

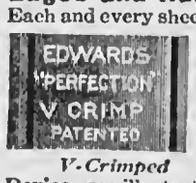
EDWARDS *Tightcote* Reo Steel Shingles

Reo Shingles

Corrugated **Costs Less! Outwears 3 Ordinary Roofs**

Anyone can lay it—right over old shingles if you wish. No special tools, skill or experience.

Edges and Nail Holes Can Never Rust

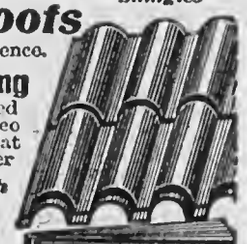


V-Crimped

Each and every sheet of Edwards Galvanized Reo Steel Shingles, Roofing, Siding, Ceiling or finish is extra heavy galvanized, piece at a time, by our exclusive TIGHTCOTE Process after sheet has been stamped and resquared. Side and edges are as heavily galvanized as body of sheet. No weak spots to rust and corrode. By Edwards Patent Interlocking Device—see illustration below, and note its construction—all nails are driven through underlayer of metal only—no exposed nail holes—no leaks.

How To Test Galvanizing

Take any other piece of galvanized metal, bend it back and forth three or four times, hammer it down flat each time—then take your finger nail and flake off the loosened galvanizing. Make this test with Edwards TIGHTCOTE Galvanized Steel Roofing—then note that galvanizing is solid to the very edges—not a sign of flaking—not the space of a pin point is exposed to the weather and cannot rust.



Spanish Tile

WORLD'S GREATEST ROOFING BOOK

FREIGHT PAID FACTORY ROOFING PRICES

This is positively the greatest steel roofing proposition ever made. We manufacture and sell all of the many patterns of Edwards Reo Steel Shingles, Roofing, V-Crimped, Corrugated, Standing Seam, etc, painted or galvanized—or other building material direct from the largest and most up-to-date Metal Building Material Factory in existence at rock bottom factory prices. You save middlemen's profits. We pay freight charges and give a permanent, guarantee against lightning losses.

Lime-Sulphur and Peach-Tree Borers.

THE INSECT AND ITS WORK.—The adult of the borer is a wasp-shaped moth, and these moths are daylight flyers. It is easy to learn whether or not a tree is infested by looking for the gum. Peach trees, when injured, exude a gum at the injured place as a protection. If a borer is causing the injury, this gum will be filled with frass—fine sawdust-like bits of wood and bark. The borer winters over in the worm stage. Those full grown or nearly full grown hibernate in the burrows under the bark, while the younger ones construct a cell on the bark outside. They do not feed during the Winter except, possibly, in the Southern States, and then only during the warm spells. When the borer is full grown it makes a cocoon at or near the surface of the ground, usually on the trunk of the tree. Those that I have seen had a large amount of frass worked into them. Inside the cocoon the borer transforms into a pupa and later into an adult. It takes about three or four weeks for this, then they come out and the female commences laying eggs.

HOW THE INJURY IS DONE.—These adults commence to emerge in southern Pennsylvania about June 15. A few may come out before that time, but not in considerable numbers. They continue to appear until about the middle of September. A few may come out after that. Each female will lay anywhere from 200 to 300 eggs. These are laid any old place—on the trunk of the tree, on grass and weeds nearby or even on the ground. The eggs hatch in nine or 10 days, and the little borers immediately hunt for weak places in the bark by which to enter the trunk. These little fellows grow rapidly and feed until cool weather forces them to hibernate. When full grown the borer is about three-fourths of an inch long. The damage they do consists of eating the softer fibres under the bark. They tunnel about when doing this in the cambium layer, the growing point of the tree. As it is not uncommon to pick a dozen from a single tree, a season's work of such a number is sufficient to put that tree out of business.

TREATMENT.—There is but one cure for peach trees already infested. Cut the borers out with a knife, always cutting with the grain of the wood. The method used by Thomas Greenfield of Oakdale is the best I know. He cuts out all he can find, having removed the soil for a depth of two or three inches, and he scrapes the bark smooth. The entire orchard is gone over before the soil is replaced. Having wormed the orchard he starts over it again two or three days later to replace the soil. But before the soil is put in place each trunk is carefully examined for borers. He is thus enabled to find many small borers which would otherwise have been missed—their presence is indicated by the frass. The injection of liquid is sometimes recommended, but it is not successful because the gum so closes the burrows that the liquids cannot reach the borers.

CONTROL MEASURES.—The best way to control the peach tree borer is by preventive measures; "an ounce of prevention is worth a pound of cure" in this case. The most successful method, I believe, is first to remove the borers—no matter what the size of the tree, whether it is just from the nursery or a 12-year old tree. Examine it carefully and remove the borers. Then paint the trunk from a couple of inches below the surface of the ground to 12 or 18 inches above the ground with strong lime-sulphur wash, to which has been added one ounce of arsenate of lead (paste) to each gallon of liquid. This can be applied with a brush or with a spraying outfit. One man to each row—two men to an outfit—can apply the solution as fast as a man can walk. The first application should be made late in May so as to be there when the first moths fly, and two or three subsequent sprayings or enough to protect the trunk, should be made. The moths will not lay their eggs on the tree with this material there, and if any young borers do get on they will be killed by the arsenic, so that there is little danger of trees so protected becoming infested. At the recent meeting of the Pennsylvania State Horticultural Association at York this method came up for discussion. Prof. H. A. Surface, stated that he found it very effective and that the cost was only one-tenth as much as digging out the borers by hand. Others who have followed Prof. Surface's advice stated that they had found the "worming" of the trees unnecessary when the trunks had been well protected during the season when the moths fly. Even if the trees are protected I would still advise looking them over once a year for stray borers.

OTHER PREVENTIVES.—Other substances for protecting the trunks have been tried with varying results. White paint, printers' ink, and a couple of brands of insect lime, are, according to the late Prof. Slingerland of Cornell, either injurious or fatal to the trees. Gas tar has been used with varying results, both beneficial and detrimental, so that it is not wise to recommend it. Tar or heavy manila paper, if sunk in the ground a couple of inches and tied tightly about the trunk of the tree 12 to 18 inches from the ground has proved very effective, and while expensive, it is more economical than digging out the borers by hand. Banking with earth or ashes during the period when the moths fly has also been very effective. Dry earth or the ashes are mounted about the trunk up to eight or 10 inches in height during the egg-laying season—June to September. This induces the moth to lay the eggs higher up and the resulting larvæ will enter near the top of the dust pile. When the mound is removed in the Fall, these can easily be detected and removed. But I believe from Prof. Surface's experience in his own orchard of about one hundred acres that the spraying with lime-sulphur wash is the most economical and effective preventive for the peach tree borer.

P. T. B.

Wheat in Schuyler Co., N. Y.

Do you know of anyone who has made a success of raising Spring wheat in Schuyler or Seneca Co., N. Y., as we understand it has not been raised in our vicinity for years? When should it be sown and how much to the acre?

Schuyler Co., N. Y. M. M. C.

I do not know of any Spring wheat being grown here in several years. A neighbor of mine about 20 years ago got some Spring wheat from a friend in Wisconsin and grew it for a few years; it yielded about 20 bushels per acre, was sown the same time as oats and about the same quantity per acre. As Winter wheat has always done well here there have been but few attempts made to grow the Spring wheat. A. H. PRINCE.

MISTRESS (who has just drunk a glass of water in the hall): "That water had a queer taste, Jane." "There ain't a live germ in it, mum. I ran it through the meat-chopper before I brought it to you."—Tit-Bits.

THE DAIRY FARMER'S RIGHT HAND MAN

With a Lauson Frost King "on the job" you have reliable farm power for every purpose—cutting ensilage, shelling corn, grinding feed, separating cream, churning, etc. An engine of this type will repay its cost in a single season. The Lauson Frost King is known far and wide because of its exceptional dependability—it is recognized by thousands as the *standard* of quality among oil and gasoline engines.

The Lauson Frost King

Gasoline and Oil Engines

Start Easily—Lauson Frost King engines start on the magneto without cranking. (No batteries used.) Patent spark retarder prevents danger of kicking back and makes starting easy. Speed easily changed while running. **Take Less Fuel** and oil and deliver more power because of special features in design and construction. Replacements minimized by having the parts case-hardened or fitted with adjustments. **Perfect Balance.**—Every part is accurately ground and fitted. Engine stands quiet even under full load—another feature that insures durability.

Guaranteed—We absolutely guarantee Lauson Frost King engines to make good on every claim we make for them; also as to workmanship and material.

Write for New Engine Book and name of nearest dealer who will be glad to give you a demonstration of the Frost King without obligation on your part. In writing us, state size engine wanted.

Planet Jr.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to almost every garden use. Has leaf guard for close work, and a durable *steel* frame. Light enough for a woman to use.

The up-to-the-minute time and labor savers in field and garden. Planet Jr implements are the product of more than 40 years' experience of a practical farmer and manufacturer. Get them for scientific work and big results. $2 to $100.

FREE Our new 72-page illustrated catalogue contains valuable advice about tools for each kind of cultivation. Write postal today.

S L ALLEN & CO
Box 1107V Philadelphia

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. The plow opens furrows for manure, seed, etc., and can be reversed for covering. Crops can be worked both sides at once until 20 inches high. Steel frame. Just the tool for the onion-grower.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has automatic feed-stopper, seed index, and complete cultivating attachments. The hoes are of a special patented form which run close to row without danger to leaves or roots. Steel frame. Two acres a day can be easily worked with this tool.

No. 8 Planet Jr Horse Hoe and Cultivator

The best-known cultivating implement made. It is so strongly built that it withstands incredible strain, yet it is light and easy to handle. Has new steel wheel which prevents clogging with stones and other trash. Cultivates to any depth and adjusts to any width. Opens and closes furrow, and hoes right up to plants without danger of injuring them.

Fire-Fly Garden Plow

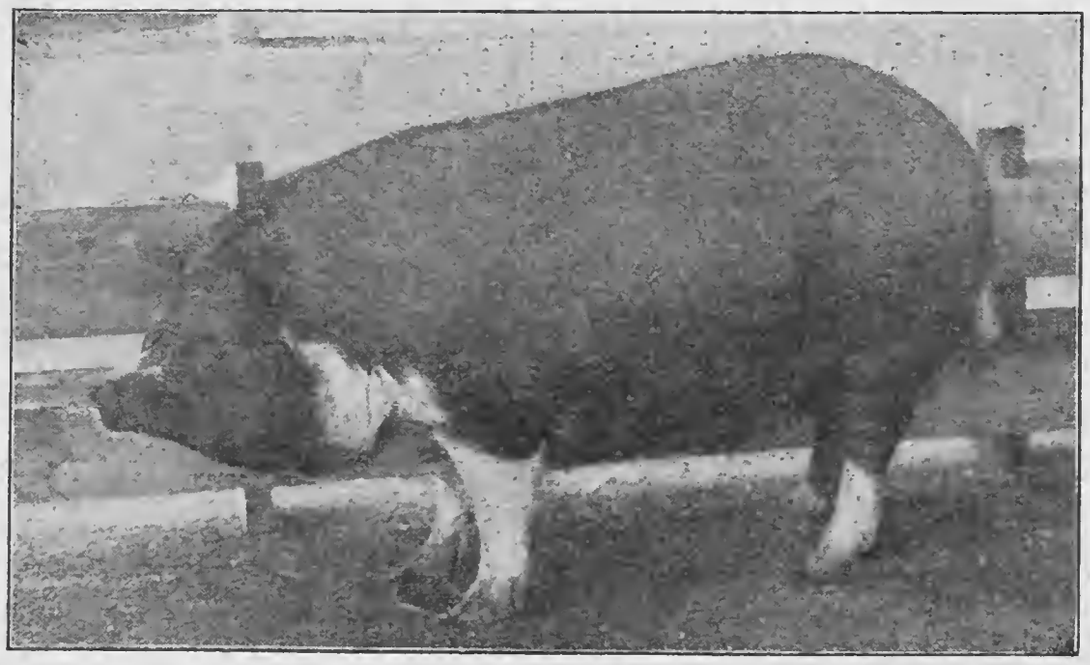
Especially useful to owners of small gardens, and to chicken-raisers for plowing up scratching yards. Its light weight makes it easy for women or children to use also. Enables the owner of a family garden to do all the work in spare minutes.

CLEANLINESS IN HOG FEEDING.

The hog responds as readily to cleanliness and care as any other animal on the farm. Not long since I was greatly impressed with the lack of sanitary conditions around the hogyards and houses of a man who has been growing hogs more or less successfully for a period of 10 years. His feeding troughs were foul with decayed food, and floors were damp and ill-smelling, and the yards were wet and full of mud holes that good drainage would have prevented. All fixtures in a hoghouse should be movable. It is advantageous to have the troughs where they may be washed out or scalded twice a week at least. It is well to bear in mind that foul troughs are good breeding places for parasites that may be taken into the stomach of the hog and cause sickness or death. Damp floors can be overcome if the house is well aired, and with windows enough to let the sunshine in on the floors. Sunshine is our greatest and cheapest disinfectant, and during cold weather its use should be more generally employed.

At feeding time care should be taken that no swill is slopped into the bedding or on the floors. It is also injurious to the health of the hogs to allow dust to accumulate on the partitions and in feeding pens. Maintaining cleanliness in all feeding places is a matter of extreme importance. If any are in the habit of feeding their hogs corn scattered in the mud or dust of a dry yard they should by all means build a feeding floor and use it. Go into any herd that is fed in the dust from thrown-down corn, and much wheezing and coughing will be heard. This is injurious to all hogs and especially those kept for breeding purposes. I have used a feeding floor for several years, and certainly would not be without one. It is built solidly of good material, and set about six inches above the surface of the ground. Around the edges a 2x4 piece is nailed which prevents lots of shelled or ear corn being pushed off into the dirt and dust. It is swept off each time before feeding. The cost of such a floor is very small, and if built of concrete it will last for an indefinite period. During the Winter my hogs are fed a good deal of Alfalfa and clover hay, and on this feeding floor is an ideal place to feed it. I cut the Alfalfa into four-inch lengths and soak it a few minutes in a tank of hot water. This does not boil the Alfalfa, but just heats it enough to make coarse stems tender and tender ones more toothsome. The hay is lifted from the tank on a fork, and allowed to drain well when it is thrown upon the feeding floor. Pigs never leave much of it, and for breeding animals it makes an excellent feed.

Watering hogs in Winter is a more important matter than is generally realized. Everyone realizes that the physiological functions of an animal require water just as certainly in cold weather as in warm. But a hog will drink very little water in zero weather if it has to go out in the cold, stick its snout into an icy bath, and fill its stomach with something which will give it the shivers for the next 30 minutes. It will not drink until it really has to, and as a consequence does not partake of sufficient water to keep its system in proper condition. We should consider water more as a food. It is just as necessary as solid food, and it requires just so much of it to keep the animals in good condition, just as it requires so much feed, although the hog may drink much more in the Summer simply to keep the body temperature down. Then why should not the water be weighed out to the hogs just the same as their feed? In Winter it is simply a question of getting the hogs to drink enough water and this is best accomplished by feeding it in a slop. The amount of water required will of course depend on the size and age of the hogs. Prof. Wm. Dietrich says this amount runs from 12 pounds per day for each 100 pounds of live weight at two months old down to about seven pounds at six months and four pounds at eight months. Weighing the water may sound like a lot of extra work to some readers of THE R. N.-Y., but when it is remembered that a gallon of water weighs approximately eight pounds it is very easy to take a couple of buckets and dip out the proper amount from the tank where the heater is. This should be mixed with other feeds to form a rather thin slop. In getting the solid feed the hogs will at the same time get the proper quantity of water. The bulk of the feed should be given dry after this is cleaned up. I find that the best way of feeding the slop is to have swinging doors above the troughs. I shut the hogs away from the troughs, place the dry feed along in them pour the water in on top of this and then let the hogs in to the troughs. This saves mixing the slop by hand and the hogs mix it thoroughly in about half a minute. By this arrangement there is no spilling of the slop while putting it into the troughs because of the hogs bumping around. Since the animals are waiting for the gates to be let down they will all have an equal chance and line up in a row and eat like well behaved hogs should.



A CLEAN HOG WITH A CLEAN HOME.

Hogs are generally looked upon as being natural scavengers who should be fed on little else than garbage and filth. Vegetables and fruit parings and refuse food from the table is good for the hog if he is allowed to consume it while fresh but after it stands a while it becomes full of disease germs and is then injurious to the health of the animal. In some cases cholera and other swine diseases have been known to be developed because of the hogs being compelled or permitted to partake of improper food and drink. As the hog furnishes so large a part of the human food it is of the greatest importance that his health be kept good. Hogs roaming at large always supply themselves with pure food and water, and do not suffer from disease as do those which are confined and heavily fed. They get plenty of exercise, and are therefore in good health, and their meat is always sweet and wholesome. They feed on nuts, fruits and roots dug out of the ground. In his wild state the hog showed himself to be somewhat of a doctor. If he killed and ate poisonous snakes he knew what plant to eat to overcome the effects of the poison. The early settlers of the West used to notice that hogs would peel the red or slippery elm tree and eat the bark, those having recourse to this treatment never becoming affected with cholera. Cleanliness in the feeding and management of swine is a very important factor in obtaining best results in this branch of animal husbandry. H. U. W.

Treatment of Ducklings.

I would like to learn most successful system of raising young chickens and ducks for market from shell to market age. I have a pen 12 feet wide, 30 feet long, that I could fix. Can young chickens and ducks be raised successfully in one house? As young ducks slop water about I thought perhaps it would be too damp for young chicks. I have fairly good luck hatching with hot-water incubators; my drawback is in brooding, which I think was in crowding. R. W.
So. Bethlehem, Pa.

Ducklings and chickens should not be raised together. If raised in a brooder follow directions that come with all good brooders regarding temperature. Give to chickens the mixed, cracked grains known as chick feed in litter where they must scratch for it, beginning when they are 48 hours old. Mix chicken grit with the chaff and supply water in a fountain that they cannot get into. Give them a chance to get onto the ground for exercise when the weather is suitable.

Ducklings should be given rolled oats and bread crumbs, with a little grit, slightly moistened for the first two days. Then begin to add bran and cornmeal. When a week old stop feeding oats and bread crumbs and begin to add green stuff and beef scraps. An ideal feed for adult ducks is vegetables one part, green stuff or cut dried clover one part, beef scraps one part, low grade flour two parts, bran two parts, cornmeal three parts. Put a pinch of salt in each mot. Fine grit should always be mixed with the mash of the young ducks, and coarse grit for the adults, may either be mixed with the feed or placed in boxes where they can get to it. Once a week mix a little ground charcoal with the feed. Drinking fountains should be arranged to prevent their entering the water, from which they should be kept till the feathers begin to grow. W. H. H.

Lame Ducks.

Can you tell me what makes ducks weak in the legs and unable to eat?
Freehold, N. J. J. B.

It would be difficult to tell, without more data, what is the cause of your trouble. Ducks may lose appetite from overfeeding, but that alone would not cause leg weakness. Rheumatism from being kept in a damp place sometimes causes trouble. I would advise putting them in a dry pen, as warm as possible, and keep a variety of fresh food before them, removing uneaten food daily. Ducks, like hens, sometimes succumb to wasting diseases that cannot be diagnosed. W. H. H.

Hatching and Rearing Ducks.

I would like information on handling duck eggs before setting. How long can they be held before setting, how to start off the young ducklings? How to feed the laying ducks and how should the young ducks be fed when 15 or 20 days old, in order to bring them to maturity as early as possible and keep them in good health? Can ducks be raised without ponds or running water? I have seven acres in town, one acre orchard, one acre garden and yard and five acres Blue grass. Eventually I wish to handle White Leghorns, White Wyandottes and Buff Orpingtons and ducks. I have some idea of raising chickens and can handle 50 to 80 hens, mongrels. They lay fairly well and keep healthy, but ducks are new to me. P. E. B.
Trenton, Ky.

Handle ducks' eggs just as you would any eggs. As ducks usually drop their eggs anywhere they are often soiled. Unless they are very dirty it is better not to wash them. They may be kept two weeks if necessary, and will often hatch well when kept longer, but the sooner they are set the better. If kept many days they should be turned every day. Begin feeding ducklings with rolled oats and bread crumbs, with a little grit and a pinch of salt, slightly moistened. After two days add bran and cornmeal. When a week old drop the oats and crumbs and begin to add green stuff and beef scraps. Gradually work up to the following for adult feed: Vegetable one part, green stuff one part, beef scraps one part, low grade flour two parts, bran two parts, cornmeal three parts. A little salt in all mash adds to its value. Ground charcoal once a week will help keep them well. Give fine grit in every feed to young ducks and coarse grit and oyster shells to the old ones, either in the mash or in boxes where they can get to it. Use drinking fountains into which the young ducks cannot get. They should not be allowed to go into water until they are pretty well feathered. If being fattened for the market they should at no time be allowed swimming privileges. They would have a delightful time, but would not fatten. The common breeds that have been domesticated the longest can be successfully reared with no water for swimming. W. H. H.

When is Milk Richest?

Could you tell me at what time a cow's milk is the richest, just after calving or when she is drying up? J. B. J.

As a general proposition the richness of milk increases as the period of lactation advances. I cannot quote any authority on the subject, but in the case of my own dairy, and also as secretary for a local cheese factory, I have noticed a gradual increase in the percentage of butter fat as the season advances, with a more rapid increase toward the end of the season. I believe this increase is especially rapid in the case of cows rather poorly fed, where the milk flow falls off rapidly after the flush of feeding pastures. The amount of milk required for one pound of cheese changes inversely, beginning with 11 to 12, and ending the season in the Fall or early Winter with about nine pounds. C. L. M.

Ration for Cows.

Will you give me a good ration for my two cows—Jersey and Guernsey—about five years old? I have on hand mangels, Alfalfa, corn and cob meal, cornmeal, bran, ground oats, wheat and rye, mixed hay, and will purchase almost anything else desirable. The Jersey, due to freshen in April, lost her calf a month ago. The Guernsey will freshen in March. The Jersey is giving only half the milk she did beforehand. I have been feeding some rye in my ground grain mixture.
New Jersey. C. T. M.

A good grain ration would be equal parts by weight of corn and cob meal, bran, ground oats and oil meal. Feed of the Alfalfa and mixed hay as much as the cows will eat up clean. Feed chopped mangels once or twice daily; a half-bushel per cow will do no harm, if you have them, but begin with a small quantity. The Jersey will probably not regain her normal flow until she freshens again. Give her about one pound of grain per three pounds of milk. The Guernsey should not have over three pounds daily of grain until a week after she freshens, then increase as above, according to the milk flow. C. L. M.

LICENSED TESTERS IN INDIANA.—In accordance with the Creamery and Testers' License Law of Indiana, Act of 1913, Chapter 340, the testing of milk and cream in Indiana creameries, milk factories, shipping stations, ice cream factories, cheese factories and milk condenseries must be done or supervised by licensed testers. This law takes effect April 1, 1914. Testers' licenses may be secured upon presentation by the applicant of a certificate of proficiency, properly filled out and signed by the chairman of the examining board, and upon payment to the chief of the Dairy Department of Purdue University Agricultural Experiment Station of the annual license fee of $2.

CLEANING BUTTER PRINTS.—I noticed someone wants to know how to keep butter from sticking to the print. Scour it with one of the cleansing materials; let it remain till you want to use it; then take some warm water and wash; then do the same again. I don't think there will be any more trouble. Just scald with butter bowl and paddle all together; then cold water; it seems to cut the grease, or something that prevents it from sticking. I think this is better than to keep utensils soaked in brine.

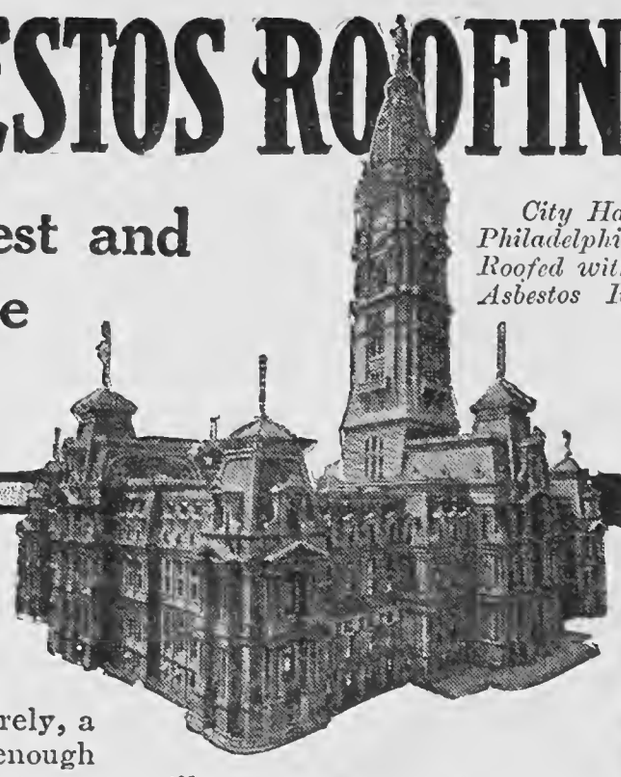
J-M ASBESTOS ROOFING

Used on Largest and Most Expensive Buildings



City Hall, Philadelphia, Pa. Roofed with J-M Asbestos Roofing

This great building, erected at a cost of $25,000,000.00, is covered with J-M Asbestos Roofing. Surely, a roofing that is good enough for this monumental structure will answer your requirements.

Hundreds of the largest and finest buildings of all types are covered with J-M Asbestos Roofing—because it is the roofing of *proven permanence.*

J-M Asbestos Roofing is *all-mineral.* It is composed of several layers of Asbestos (rock) felt cemented together with Trinidad Lake Asphalt—the greatest waterproofing substance known.

It contains nothing to rot, rust, melt, crack or deteriorate. Never requires graveling, coating, or any form of preservative. Its first cost is the last cost. Cheaper than tin, iron, slate or shingles—and the cheapest-per-year roofing on the market. Gives perfect fire protection. Adapted to any climate. Keeps buildings warm in Winter and cool in Summer.

Furnished in flat sheets or in rolls. It can be applied by any handy man. J-M Roofing Cleats, packed in each roll, make absolutely watertight laps and give the entire roof a handsome white appearance. Suitable for any type of building.

Sold direct if your dealer can't supply. Write nearest Branch for sample of the wonderful Asbestos Rock and Book No. 3148

SELLING OAK TWIGS.

The picture shown gives an idea of a new industry which is being developed in southern New Jersey. This is the gathering of oak twigs containing the leaves. These twigs are gathered and tied into bales as shown in the picture, and in this way the oak twigs are handled and transported. There is a large trade in this material, the twigs being exported to Europe, where they bring a fair price. They are used for brewing into a tea, used as a medicine for the treatment of colds. It is said that the use of this tea is quite common in Europe, not only among the Hebrews and the Poles, but many other inhabitants use this decoction, thinking that it makes a valuable medicine or tonic. At any rate the gathering of these leaves makes a new horticultural industry, and is the means of giving fairly profitable work to a number of people.

LOADING OAK TWIGS.

LIME AND THE MULCH PROBLEM.

Our readers remember the article on formation of acid solids, given on page 1. This was the first part of a review of some remarkable experiments by Prof. Frederick V. Coville, who has given a most thorough study to this subject. The article described the formation of acids in the soil, and the formation of leaf mold. We shall give soon a further discussion of this matter. In the meantime Prof. Coville gives the following suggestion regarding the effect of a mulch in an orchard. This will be a new thought to many of our readers, who have not considered the true effects of lime upon the soil. This is well worth considering, as Prof. Coville is our highest authority in matters of this kind.

For several years I have been much interested in your articles on the successful mulch system of handling apple trees practiced by Mr. Grant Hitchings near Syracuse. Your article on this subject, published on page 137, leads me to make a comment which I have long had in mind.

Five reasons are assigned in your review of Prof. Hedrick's conclusions, for the success of the mulching system on Mr. Hitchings' own place. The question arises in my mind whether there is not a sixth reason perhaps more fundamental than any of the other five. My question is: "Is not the soil of Mr. Hitchings' orchard a limestone soil, and if so, is not his success due largely to the fact that the underlying soil carries the decomposition of his mulch through the acid stage into the alkaline stage, with all the consequent stimulation of nitrification and increase in fertility, and are not some of the failures of the same mulch system in other localities due to the natural acidity of the underlying soil and the suspension of decomposition in the mulch before it has passed from the acid to the alkaline stage?"

You will remember the change from acidity to alkalinity in the progress of the decomposition of leaves which I described in my paper on "The Formation of Leafmold," and from your reading of that paper you will readily appreciate that in the absence of an alkaline soil underneath the decomposing mulch there may easily be produced a permanent acid condition of the rotting mulch itself, resulting in a practical failure of the system.

It seems to me that one of the direct lessons to be drawn from my observations on the formation of leafmold is that a mulch system on a limestone or alkaline soil is likely to produce results almost the opposite of that produced on a naturally acid soil. If this view of the matter proves to be correct, the use of liberal applications of lime to apple tree mulch in orchards growing upon a soil with acid tendencies is likely to be necessary in the development of an efficient mulch system on such soils. When practicable the addition of a little manure is also suggested as a means of supplying the mulch with a vigorous inoculation of the beneficial organisms of decomposition. Under this plan the mulch is treated essentially as a compost and that is the way in which we really ought to regard it.

FREDERICK V. COVILLE.

HEATERS TO PROTECT CUCUMBERS.

Can you give me any information in regard to fighting the early frost in Fall? Is the smoke smudge a success, and would it be a good way to save expense to lay a layer of bricks about two feet square with an air space and a rim to hold the smoldered coals in place a good way? Would it be enough if I only used sawdust, which I can get for nothing, or mix it with something else, and what? How far apart should each fireplace be from another? Do you think ready-built field hearths would be better? I want to try them in a field of late cucumbers.

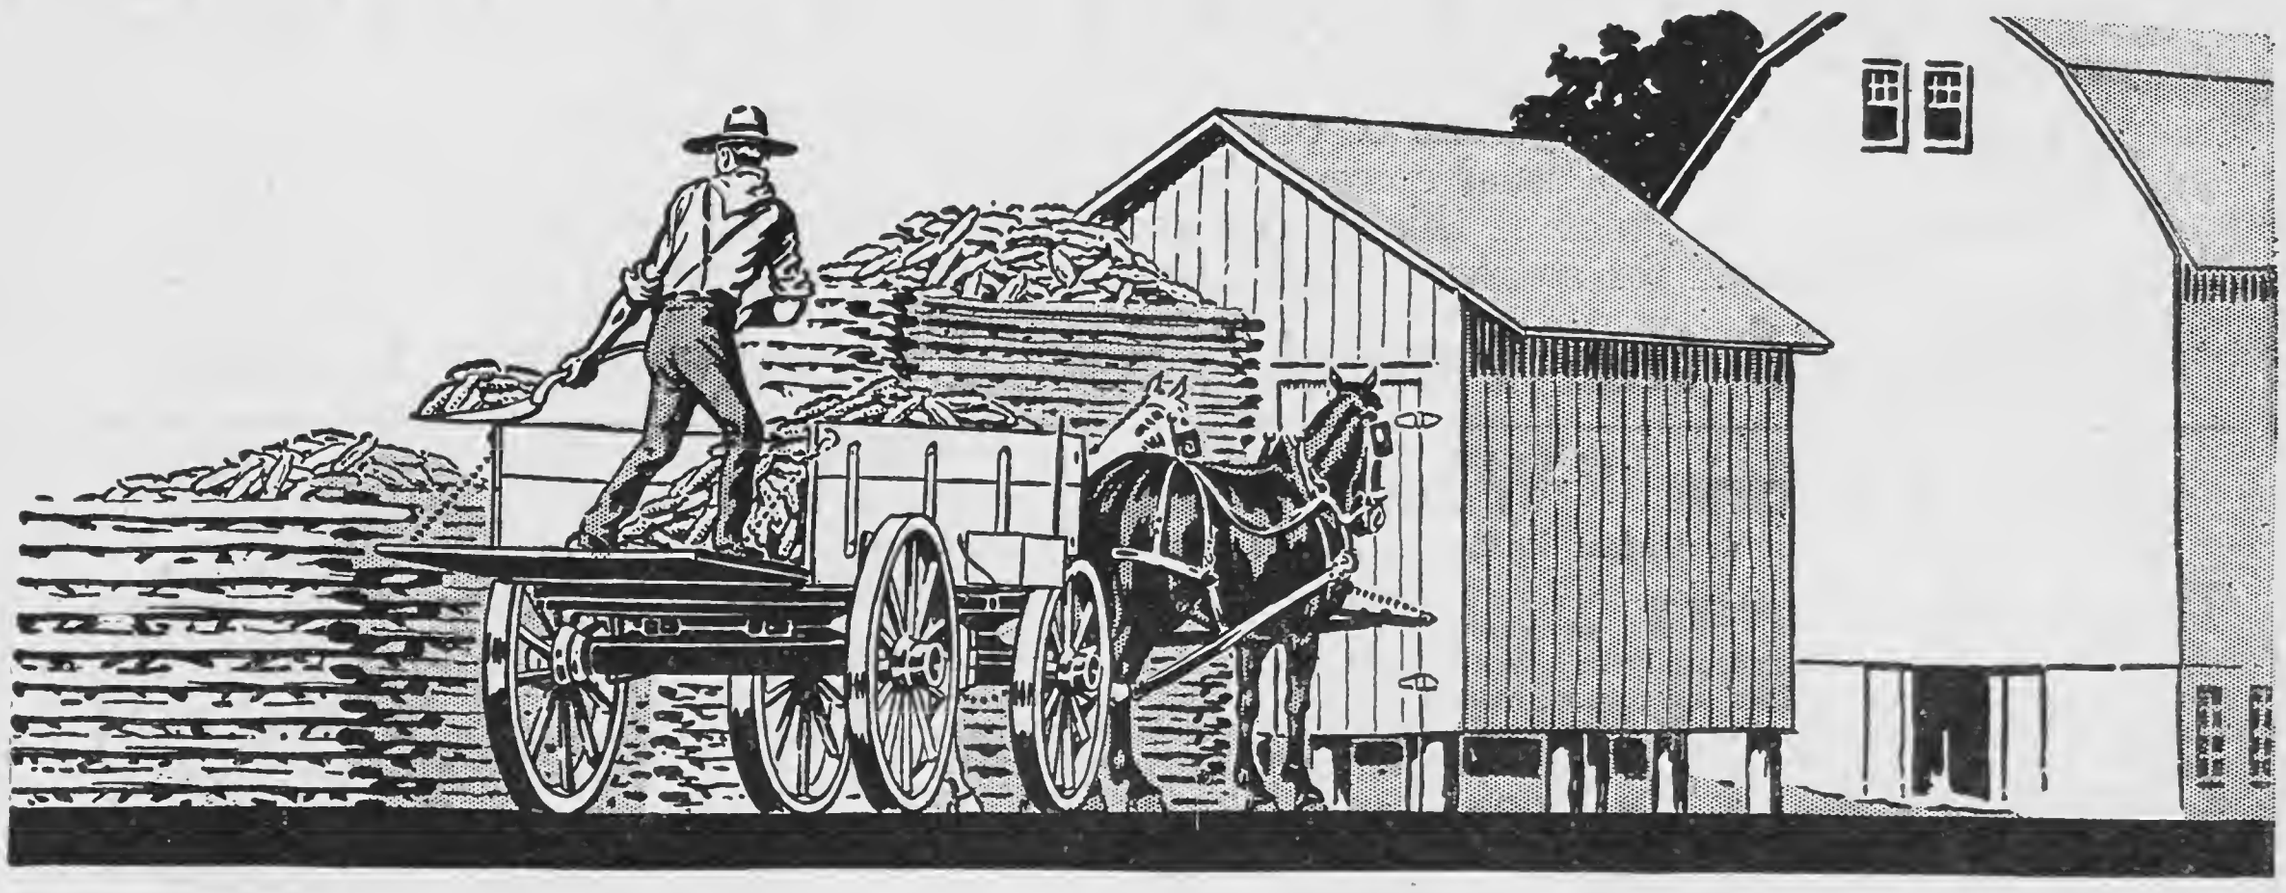
Ramsey, N. J. V. P.

I think that one of the types of orchard heaters would be greatly superior to any attempt at smudging by burning such material as sawdust. It is an open question, however, whether the practice of using heaters would be profitable in the growing of late cucumbers.

Our experience in the use of orchard heaters in our peach orchard at Vineland, for the past two years, has not given us results that would warrant us in recommending them for eastern conditions. This does not mean, however, that we were not able to keep up the temperatures. The story is too long to give in a brief reply. I can say, however, that I believe that it would be necessary to use about 125 heaters, of two to three gallons capacity, to be certain of preventing injury by cold in the late Fall. These heaters would cost from 20 to 40 cents each, according to the type, and one would consume 200 to 300 gallons of oil per acre in a single night if the cold extended over a number of hours.

Fuel oil, which is recommended for these heaters, cost us six cents per gallon, last Spring, by the barrel. These facts may serve in a general way to give one some idea of what the expense might be. In our experiments a heater of the three-gallon Hamilton type showed to advantage, especially with respect to the cover, which did not blow off when there was considerable wind. The covers of the lard-pail type were always blown off to a greater or less degree and scattered about the orchard, so that some water got into the oil during rainstorms.

One could undoubtedly raise the temperature several degrees over an acre of cucumbers by the use of orchard heaters, but to my mind the real question is whether enough extra money could be secured for the late crop of cucumbers to pay for the trouble. It might be a fact also that the cucumbers would not grow and develop as they should because of cool temperatures during the day at that season of the year, even though no actual frost occurred. M. A. BLAKE.



Corn is our greatest Crop

It is <u>worth</u> more than any other crop
It <u>costs</u> more than any other crop

A big item in this cost is over one hundred million dollars' worth of actual potash, which the corn crop takes from American soils every year—more than eight times the total importations of

POTASH

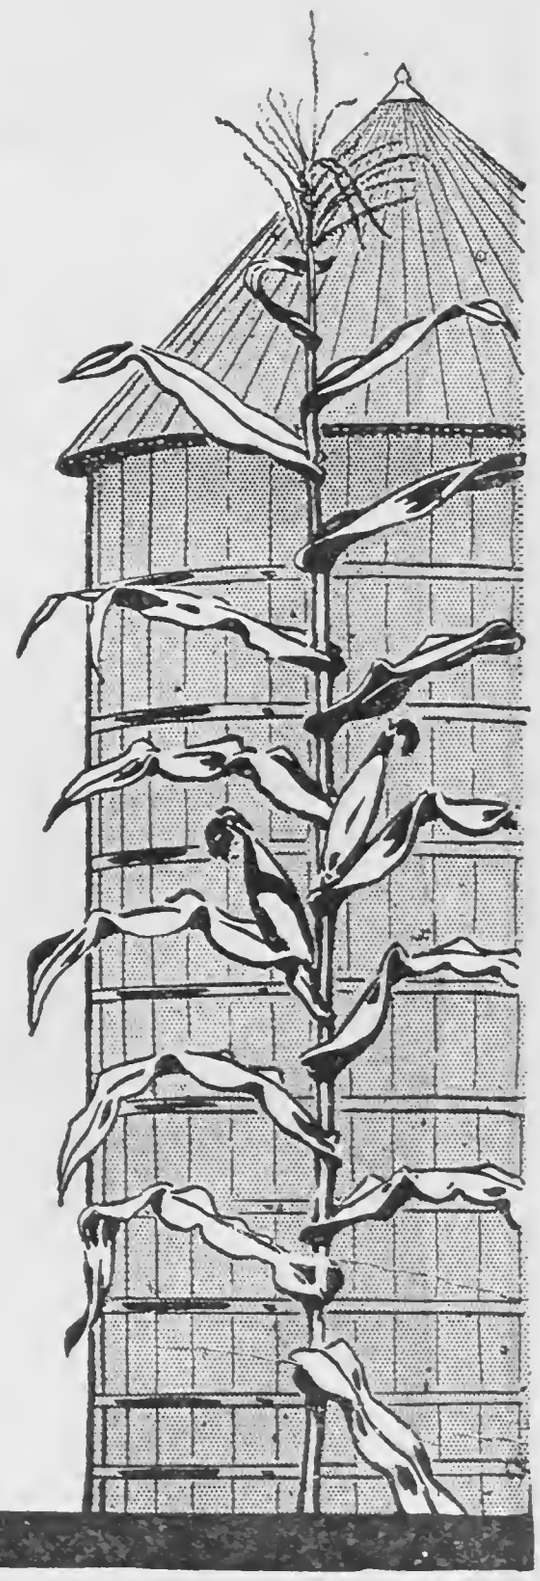
The corn plant uses over a pound and a quarter of potash for every bushel of ears produced.

It uses more than twice as much potash as phosphoric acid.

Supplement the manure or clover sod by 400 to 600 lbs. per acre of a fertilizer containing at least as much potash as phosphoric acid—0-8-8 or 0-8-10—or broadcast 300 lbs. acid phosphate and 100 lbs. muriate of potash per acre after plowing and before harrowing, and drill in with the seed 100 lbs. per acre 2-8-8 goods. On muck lands broadcast 100 to 200 lbs. muriate of potash per acre.

To drive away cut worms and root lice, drill in 100 lbs. Kainit per acre with the seed. Potash makes more sound ears in proportion to the stalks. It makes much more and much better corn for either crib or silo. **Potash Pays.**

We sell potash in any amount from one 200-lb. bag up.



Write for prices and for free pamphlets on profitable use of fertilizers

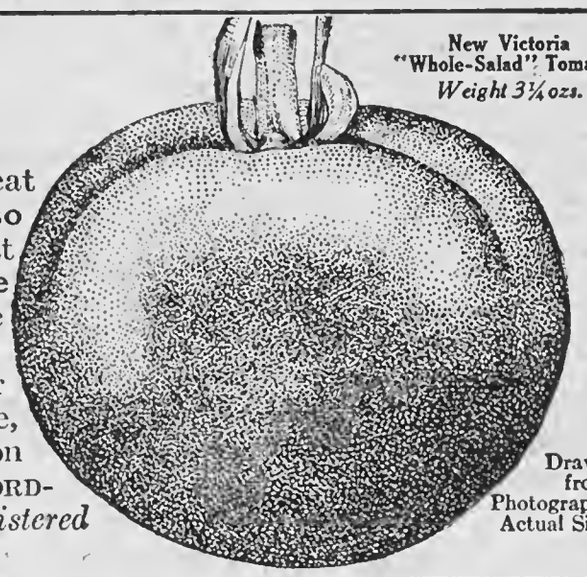
Burpee - Quality Vegetables

Quality is the **Keystone** of our success. Burpee's Seeds cost more to produce than do usual commercial grades, but are worth much more than the difference in cost. Proof of this statement is the acknowledged fact that we have built up and maintained for so many years the largest mail-order seed trade in the world.

"Five of the Finest" for Twenty-Five Cents

New Victoria "Whole-Salad" Tomato

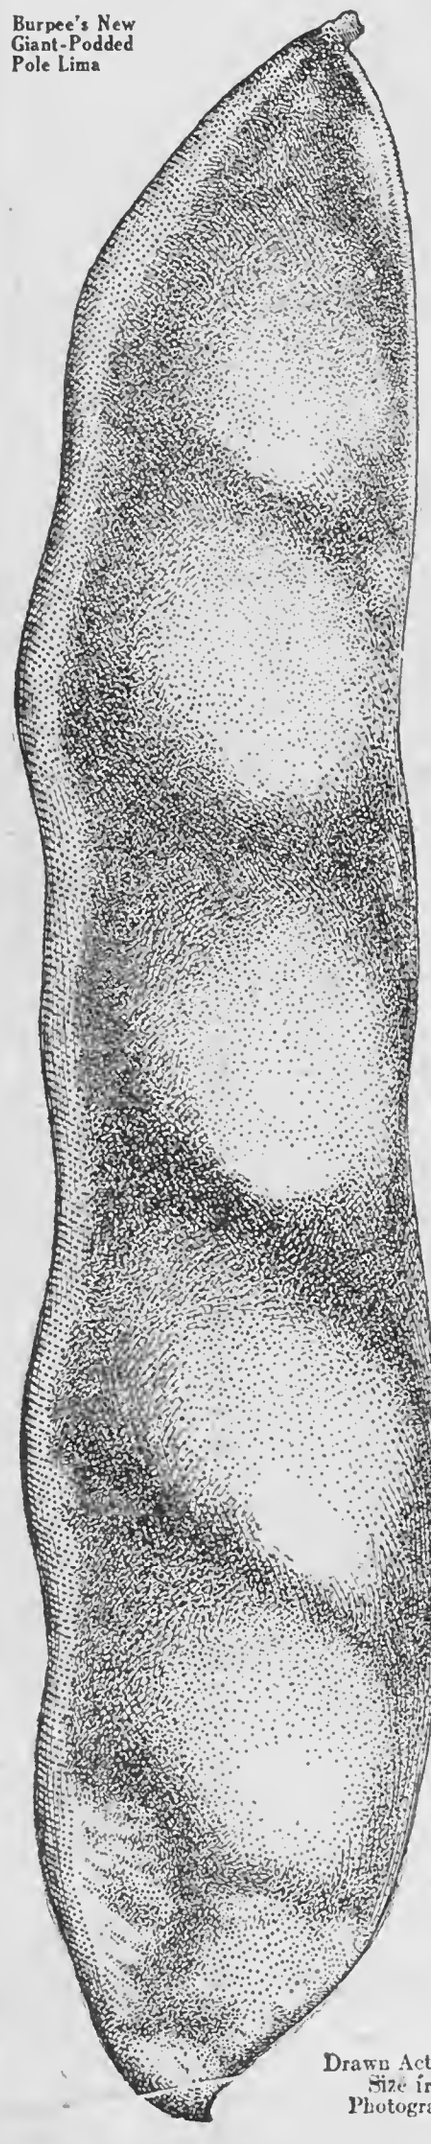
Most Delicious and Most Prolific of All "Individual" Tomatoes



New Victoria "Whole-Salad" Tomato
Weight 3¼ ozs.

Drawn from Photograph, Actual Size

This Unique Novelty will be welcomed by thousands of planters because of its great superiority both in quality and productiveness. **It bears so tremendously and so continuously** that twenty plants should yield more than one family could eat in a season. The vigorous vines are covered with fruits borne closely in clusters,—as many as **three hundred and seventy-three well-developed fruits on a single plant at one time.** The tomatoes measure two and a half inches in diameter and weigh three to four ounces each. They are of a rich bright scarlet color right up to the stem, and so solid that they remain in fine condition for a long time. The firm fruits are just the right size for serving whole, either alone or with lettuce, while the flavor is the best we have ever found in a "whole-salad" tomato. ☞ For full description and illustration of a cluster from a photograph,—*see page 25* of BURPEE'S ANNUAL FOR 1914. FORDHOOK-GROWN SEED *is sold only in small sealed packets each containing forty seeds and bearing our Registered Trade Mark.* **Per pkt. 15 cts.; 2 pkts. for 25 cts.**



Burpee's New Giant-Podded Pole Lima

Drawn Actual Size from Photograph

For 25 Cents we will mail a fifteen-cent packet of the unique new VICTORIA "WHOLE-SALAD" TOMATO advertised above, and **also** a special ten-cent packet (nearly two ounces) of—

Burpee's New Giant-Podded Pole Lima Bean.

The largest and most delicious Lima bean the world has ever seen. A few poles even in a city "back yard" will keep the family supplied with such quality-beans as will be a *revelation* compared with the best that can be bought on market. For illustration and description,—*see pages 9 and 35 of* BURPEE'S ANNUAL FOR 1914.

☞ **Also**—(all for twenty-five cents!)—a Regular Packet each of—

Burpee's Earliest Black-Red Ball Beet

Extremely early, of intensely rich color and superb delicacy. See illustration and description on *page 10* of BURPEE'S ANNUAL FOR 1914.

Naumburger or "Tenderheart" Lettuce

An extra early, large-heading, hardy lettuce that stands summer heat and is of fine quality, sweet and buttery,—*see page 57 of the B. A.*

New "Lucullus" Swiss Chard.

A useful, "double-purpose" vegetable that yields enormously all summer long. Serve the thick green leaves like spinach and use the broad white ribs as cooked celery. Both are of fine flavor and wholesome. For illustration and description,—*see page 37 of* BURPEE'S ANNUAL FOR 1914.

25 Cents **buys all the above "Five of the Finest" New Vegetables** which, purchased separately, *would cost fifty cents;* **five collections mailed for one dollar,**—and mailed to five separate addresses if so ordered.

☞ In each collection we enclose **free** a copy of an Interesting New Booklet on THE FOOD VALUE OF FRESH VEGETABLES, specially prepared for us by a recognized authority of National Reputation and illustrated with thumb-nail caricatures, and **also** a liberal packet of a charming MORNING GLORY as announced below. This is the most attractive offer in Vegetable Seeds yet prepared and should induce thousands to plant vegetables (even in city back yards) who have never done so before.

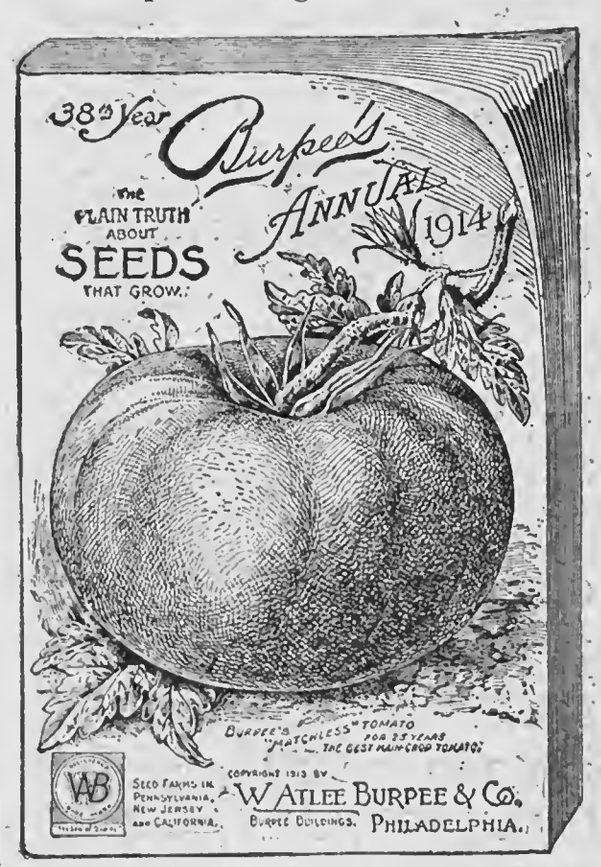
As a Compliment to the Ladies we shall include in each collection of **"Five of the Finest,"**—ordered AT ONCE at the Introductory Price of 25 cents—one packet (such as sold for ten cents last year) of *either* BURPEE'S AIRY-FAIRY or BURBANK'S CRIMSON-FLOWERING—the most beautiful **"Two Mistakes in Morning Glories."** For accurate descriptions and explanation of the two mistakes,—one made by BURBANK, the other by BURPEE,—*see Illustrated Circular sent with each collection.*

☞ Everything on this page for 25 Cents ☜

Five Complete Collections Mailed for One Dollar.

The House of Burpee

has introduced more distinct New Vegetables and Flowers that are now in cultivation than have any three other American firms. Selected Stocks are produced upon our own seven seed farms in Pennsylvania, New Jersey, and California, while FORDHOOK FARMS are famous as the largest and most complete trial grounds in America.



Burpee's New Annual for 1914

Long Known as "The Leading American Seed Catalog"

"THE SEAL OF QUALITY"

Our SILENT SALESMAN tells **the plain truth** about The Best Seeds That Can Be Grown. With colored plates of Burpee-Specialties, this bright book of 182 pages shows hundreds of the choicest vegetables and most beautiful flowers, illustrated from photographs or painted from nature. It is almost indispensable to all who garden for pleasure or profit, and is mailed **Free to all** who can appreciate the value of **QUALITY IN SEEDS.** It will be surely worth your while to read THE BURPEE ANNUAL. It costs you only one cent for a post card to send us your address, and you are under no obligation to buy. We never annoy applicants with "follow-up" letters. Shall we mail *you* a copy? SOME LOCKPORT GRANGE ACTIVITIES.

What "Getting Together" Means.

Director L. H. Goddard of United States Department of Agriculture wrote in December: "Much has been said regarding coöperative organizations in Ireland, Denmark, Germany, and other European countries, but we hear very little of what has been done along that line in this country. Indeed, many talk as though scarcely anything whatever had been accomplished here. So far as we can judge, however, from the scraps of information which are coming to us from all sides, the amount of organization work which has been done in this country is very much under-estimated. It is probable that a summary of it all will show that instead of standing still as many have supposed, we have as a matter of fact, been advancing very fast indeed."

Coöperation is one of the greatest things in life for farmers and fruit growers, getting together and exchanging experiences and methods, buying in quantity at wholesale and acting in harmony and cutting out petty wranglings—that is coöperation, and a short account of what our Grange has done may help other organizations.

Lockport Grange, No. 1262, was organized two years ago on the 30th of January, 1912, with 57 charter members, and when one year old had but 90 members. Then we initiated a contest for new members, with the prize to the one obtaining the most new members of a trip to Ithaca with expenses paid for Farmers' Week. This created much interest and brought in many new members, so that we now have 200, with large classes being taken in on every day assigned for the purpose, and consider this a good showing for a two-year infant Grange. The first master was E. E. Crosby, then Earl Gregory and the present incumbent is G. W. Haines. The past year there has been much coöperative buying, Daniel N. Pomeroy having been appointed purchasing agent. We have used several carloads of tile this past Fall, and a large part of this tile-draining would not have been done, at least not right away, had it not been for the Grange and the cheaper prices (40% discount) obtained through coöperation. Although the first tile put down in America was laid in 1835 on the Johnson farm at Geneva, New York, there are a great many parts of the State that would be greatly enhanced in productiveness and value by using tile draining.

We used several cars of fertilizers, grape posts, lumber and lime and have done considerable other wholesale buying, but very little as yet in coöperative selling, though there are plans under way for the growing of seed oats, corn and potatoes and selling through this joint action and advertising.

The Lockport Grange has won the first prize at the Niagara County Fair the two years of its entry, with keen competition from other Granges. The get-together spirit of these exhibits has been extremely good, the members taking active part and interest and now intend entering exhibit at this year's State Fair. We have beaten the rest of the State in a race on fruit growing, as Niagara County is admitted the banner fruit county of the Union, and so it is with all assurance of success that we plan on our State Grange competition.

It is very easy to understand the social and busi-

LOCKPORT, N. Y., GRANGE TAKES THE ROAD. A LOAD OF HUMAN FRUIT FOR THE MOTOR TRUCK. FIG. 155.

less advantages of a Grange composed of members of a farming community with so many similar problems and interests getting together and obtaining mutual help. It is also easy to understand the financial advantages in buying wholesale and saving 20 to 50% on the many things needed in running the houses and farms; bought several hundred pounds of best coffee at less than the price of common grades, and many other savings in groceries, and also a good saving in binding twine. I attend many fruit growers' and other conventions where there are displays of all kinds of things requisite on the farms, and by being constantly on the watch and talking it over obtain many desirable bargain prices for the Grange. I have just made arrangements whereby this Grange will save $10 per thousand on the average on the different styles and sizes of fruit baskets needed, and for which settlement will not be needed before Fall, where desired, by giving notes payable after fruit is marketed.

Last Spring the Lockport manager of the New York Telephone Company, in effort to make larger dividends by curtailing the number of operators in the exchange and in the repair work, made a distinction between the city and country users of telephones, and in spite of much opposition changed all the rural telephones out of the exchange to the obsolete crank type in vogue 20 years ago. The country users strongly objected to the nuisance of hearing the ring of every subscriber on the same line, the necessity to crank the pesky thing for considerable time to get the operator, or if some one on the same line was wanted, to do the ringing personally without help of central. It cost the telephone company $9,000 to make the change, but it would take days to tell of all the inconveniences of the system to the users. Individuals were powerless to obtain satisfaction of any kind, and many in disgust ordered their telephones taken out. The Lockport Grange, a concerted unit of outraged farmers, through committee, forced the telephone company to reinstate their former satisfactory service as it was before the change, and the same as the city users had through the same exchange all the time. This shows what coöperation can do. While we numbered less than two hundred then we had thousands and thousands of other Grangers back of us and the fear of the Public Service Commission in the telephone company, and we accomplished what would have been otherwise impossible without organization.

The editor of THE R. N.-Y. has asked for a description of a coöperative pleasure and improvement trip made last August by 25 members of our Grange in a large automobile fruit truck, covering two days and many miles through the fruit belt of the county, along the historical Niagara Frontier and over the new Niagara Boulevard into Buffalo, and then over State roads home. While we have more than a dozen auto trucks in the immediate neighborhood, we went in the largest of these marketing trucks, and it comfortably seated the 25 members of the party. The occasion was the annual Summer meeting of the New York State Fruit Growers' Association held at Olcott Beach, where 1,500 gathered to hear State Commissioner of Agriculture Calvin J. Huson, and other prominent speakers. One of the local papers said, "A feature of the entry of delegates this afternoon was the arrival of the big red motor truck of Albert Eighme loaded to the gunwales with well-known Grangers from the towns of Lockport and Cambria who started shortly before noon and came to show Commissioner Huson how progressive Niagara farmers are in the matter of using gasoline."

On this outing we heard some very valuable lectures on fruit growing conditions and transportation problems. We made a side trip and inspected apple and peach orchards. All along the Lake Road are found extremely valuable farms, and their orchards, loaded with fruit, were of much interest to the party. There are always worth-while ideas obtainable in carefully noticing how others are handling similar problems to your own.

After short stops at Wilson and Youngstown we arrived at Lewiston and staid at the Frontier House, which was built nearly a century ago, and quite in harmony with the historical village. A heavy rain early the next morning delayed the start away, but sight-seeing along the river and across into Canada, by some, and singing and dancing in the large parlor whiled away the morning hours pleasantly and immediately after dinner the trip was resumed to Niagara Falls, and after a couple of hours there, on into Buffalo and theatre. It was late, very late, when the party of tired Grangers reached home, and there was not so much singing on the home trip, as everyone was tired, but each and all considered it a very successful, enjoyable outing. It was not expensive, dividing the cost of oil and gasoline between the men, and the wives supplying large baskets of good things, it made the individual cost very low.

If farmers ever could band together and coöperate in the best ideal of organization what right farm products prices could be obtained and what a power in the land and in better government. But admitting the fact that farmers cannot, or will not, ever act entirely together as a harmonious unit to any great extent, it is sure that the trend of the work of the Grange in coöperation is well worthy of emulation, and it would be interesting and instructive to hear from others what they are doing or have done along similar lines. It has been said that the ones who know the most about farming are the ones who have the least time to write out their valuable lessons for others, but in the Winter months time could be found, it would seem, for mutual help.

DANIEL N. POMEROY.

CHICKEN THIEVES AND RURAL POLICE.

Having considerable experience, let me say a few things about shooting at chicken thieves. We have been so pestered by these vermin, in addition to those that are winged, furred, clawed and four-legged, that I have for years kept young and old chicks surrounded by an electric alarm; which I am sure has saved us much further loss. But it is a perennial nuisance! By chance, I discovered the very last attempt (out of a dozen) before my alarm was completed. I fired, they ran, dropping the chicks. Another time, I fired to accelerate the progress of one who sprung the alarm. I intended only to "pink 'em" enough with bird shot at say 200 or more feet, to make them sit standing for a time, and conclude thieving is a dangerous business. I believe I now have a pretty fierce reputation. Well, the blacker they paint me the better I like it; the less probability I shall needs have occasion to "make good."

What, shall we try to capture a thief barehanded? Several men have lost their lives so. Common knowledge teaches us that the thief is both armed and unscrupulous about killing when cornered. We have the right to more than equal footing when meeting outlaws! Moreover, being unknown, he runs very small risk of capture even if he murders you. This brings me to my main point, which is, that what this country needs is a trained rural mounted police, with dogs. The present political constabulary is about as efficient as a "busted" musket at catching criminals, let alone preventing crime. They are 100 per cent. efficient when it comes to haling honest, peaceable and busy citizens to court on jury duty, to waste their time listening to quibbling lawyers wrangling over technicalities and other irrelevances that haven't the least bearing on substantial justice! This will continue, I suppose, until the people become sufficiently wrathy to boot the whole crew out and put in men actuated by common sense. Our laws are administered far too much for the protection of criminals and far too little to protect and encourage law-abiding people.

I suggest that part of our military be assigned to police duty, instead of loafing in barracks. Why, there has been an awful series of the most atrocious crimes committed recently in rural districts, and a trained rural police ought to have some deterrent effect on such, as well as being ready to pursue criminals before they get half a day's start, as at present. The Aqueduct police have reached here in four minutes from Cornwall, 1½ miles away, when telephoned for.

Keep a dog, eh? Fine—if they'll let you *keep* him! But a dog is only good when backed by a man—with a gun. I've been told chickens were stolen in Cornwall under the noses of a bunch of bulldogs so savage they nearly killed an honest man in the daytime. There are several ways of getting 'round a dog!

LEO A. MAPES.

Orange Co., N. Y.

"CHICKEN BUSINESS" IN SWITZERLAND.

The chicken boom is on in this country, and the hen fever has a high temperature. Some of the gentlemen who are responsible for this, ought to move over to Switzerland and give the Swiss a run for their money, and then get the money. Consul Phillip Holland, Basel, Switzerland, makes a curious report of poultry conditions in his district. He says the average Swiss farmer considers his land too valuable for raising chickens. In the Spring and Fall the birds run in the field, but when the crop starts, the hens are shut up. The result is that cooking eggs are imported from Italy. Fresh eggs appear to be worth 40 to 60 cents a dozen the year round. There would seem to be a wonderful opportunity for our friend Philo, (better than in Florida), or some of the other poultry system-makers. Why should they waste their energy in a country like this, when the Swiss do not keep chickens, because there is only room enough in the backyard for the pet dog? These gentlemen ought to be able to tell the Swiss people how to convert that dog kennel into an egg factory, which would turn out several hundred eggs a week. Mr. Holland says that after a careful search he found only one incubator in Basel, and that was a baby incubator. Certainly here is an opportunity for a poultry contest to see which manufacturer can strike the Swiss market in the quickest time. Mr. Holland makes the following statements about the poultry market. He says that young roosters are called by what he terms a polite fallacy, "pullets," and that the Swiss have no way of telling the difference except by hunting for the spurs.

Search as one will, it is not likely that a hen, fat or lean, young or old, will be found in the local markets. The only chickens prepared for the market are the young cocks, the surplus of which are killed, their body feathers picked off, and the chicken, including head, feet, and entrails, retailed at 50 to 60 cents a pound. The pullets and hens are kept for brood purposes. If a hen, through age of service, should cease to be prolific she, too, might be killed, after being fattened, and offered for sale. There is an instance of this which has been ascertained by diligent inquiry. However, when an offer was made to purchase, the would-be buyer was told that the hen was good only for soup, as it would be a useless waste of fuel to render the fowl tender enough for eating. The hen appeared fat and eatable, but the market man demonstrated that he was telling the truth by showing that it was impossible for a strong man to break the breastbone, which is the usual pre-cooking method of ascertaining whether a chicken is tender.

The average farmer usually keeps 12 to 20 hens, and no one seems to think of raising chickens for profit. Such a practice as killing hens after their first season is unknown. The Swiss seem to believe that hens improve with age, perhaps something after the manner of old wine. Thus, old Spot, or Speckle, will be kept until she drops dead, and is as much a member of the family as the veteran old horse or cow.

FITTING SOIL FOR VIOLETS.

I am in the greenhouse business, growing violets. I have a dark, heavy loamy soil. For my next year's soil I have put on one ton of ground lime to the acre; I have plowed a crop of rye and a crop of clover. My soil seems to go down hard after it has been in the greenhouse a while, and it gets a green moss on it. It seems to get a crust on it, and I do not get good root action. What do you advise? B. B.

Red Hook, N. Y.

The soil here described is evidently very similar to our own, and judging from our experience would suggest that it is deficient both in humus and lime. It was a great mistake to plow the rye or clover and leave the soil bare during the Winter, and the best thing that can be done now would be to procure 50 to 75 tons of horse manure and spread over the acre you wish to remove to your violet houses during the Summer. If you do not use an acre of soil, manure what proportion you do use at rate of 75 tons per acre. Even more will not do any harm, as the best crop of violets we ever grew was in a house built over a piece of land plowed in Spring, containing a heavy stand of clover, and having a coat of manure so heavy plowed under that each furrow was filled before the next one was turned on it.

Plow the manure you put on early in Spring and sow a heavy crop of turnips or any quick-growing crop that will add humus, to be disked and worked in soil before removing to house. This green crop should be disked and turned under several weeks before soil is to be used. After soil is in house, and is being prepared for planting crop, apply half ton per acre of hydrated or thoroughly air-slaked lime. If the green mold appears apply more lime after plants are set, and work soil up lightly between plants, then water at once. Do not be afraid to use lime, as high fertilization and a large amount of humus require plenty of lime to correct accidity.

If you can spare the land, take a plot the size you generally use this Spring and sow a heavy crop of cow peas in May. Plow these under about August 15. Apply lime, a ton or more per acre (I do not mean ground limestone, but burned lime, finely slaked); then sow at least one bushel Hairy vetch seed per acre, which plow the following Spring when 12 to 18 inches high; then apply good coat of manure and disk it in and keep stirring up every few weeks till wanted. This treatment will have to be supplemented with chemical fertilizers according to crop requirements. We have never yet found anything better than vetch to cover the ground during Winter and make it in fine planting condition in Spring.

ELMER J. WEAVER.

Pennsylvania.

BREEDING STOCK IN RICE.

We hear about the importation of purebred stock from foreign countries for the purpose of improving our flocks and herds. Tom Barron's Leghorns are coming, and cattle from the Channel Islands, and Scotland, horses from France and Belgium and even sheep from Asia to improve the fleece of our native sheep and make it pass as fur. This "pure blood" is not confined to living animals. There is, also, "pure blood" in plants. Agents of the Agricultural Department go all over the world hunting for valuable new plants—all the way from Alfalfa to water-cress. You might not think it, but some of

WEST AFRICAN RED RICE FOR BREEDING. FIG. 156.

this pure blood is shown in the picture at Fig. 156. This is West African red rice. Two plants are growing at Crowley, La., as shown in the picture. The plant shown has spread to a diameter of nine feet. This red rice in its present form may not have commercial value in this country, but it may be used in hybridizing experiments with our domestic rice. It is possible that by such crossing a new type of rice may be developed which will prove stronger and hardier. Thus this rice plant may be called imported stock for breeding.

HILL STRAWBERRIES AND FERTILIZER.

We have frequently been asked to tell how strawberry plants grow in the hill system. The picture at Fig. 157, taken from Bulletin 113 of the Missouri Experiment Station, gives a very good idea of the matter. Our plants grown in hills present just about this appearance when they are dug up. Under this system the plants are set equal distances apart. Formerly we set such plants three feet each way, but 2½ feet seems a more practical distance. They are well cultivated, working both ways with the horse, and also hand-hoed. The runners are chopped off as they appear, unless it may be that four or five strong plants are put down at equal distances from the parent plant, and well hoed around it. When runners are kept chopped off the plant grows about as shown in the picture, with a large number of crowns grouped or bunched to-

HILL OF STRAWBERRIES. FIG. 157.

gether. When such a plant is fruited it will make a spread on the ground as large or larger than a peck measure, and on good soil, and with fair culture, the yield is frequently enormous. There is a good deal of labor about this system, and certain varieties are better for hill growing than others. Most growers prefer to let the runners grow, and thus make a matted row of plants.

In the bulletin mentioned experiments were made and it seems clear that this removing the fruit stems early in the season. The result of this cutting out was an increase in the number of runners, and it seems clear that this removing the fruits stems on young plants, certainly hastened the beginning of runner formation, which, of course, with the plant grower would be an advantage. As for the use of fertilizer, where nitrogen was used in the Spring, the plant was forced into a very vigorous growth. Runner formation was increased, and there were fewer plants set. This has been our own experience in applying nitrate of soda in the Spring. The plants are forced into a larger growth, and the berries are of good size. But this nitrogen seems to stimulate the plants so that the crop is really smaller than it would be without the nitrogen. In Missouri the experiment showed that acid phosphate gave a profitable increase with strawberries. There was little return from potash, either in crop or in quality. Nitrogen applied one year before the crop is harvested gave fair results, dried blood seeming to be better than nitrate of soda. When the nitrogen was applied in the Spring of bearing, it did not give satisfactory results.

"A FARM IN VERMONT."

We are seriously considering the purchase of a 240-acre farm in Vermont—100 acres tillable, 50 acres pasture. The farm is on the southern slope of a mountain, and has an elevation of 1,000 feet. Our idea is to set out an apple orchard of several thousand trees, and while the orchard is "making good" to go into the poultry business, as we have had quite a lot of experience with raising chickens. We would also have either beef cattle or milch cows and probably a flock of sheep. Do you consider the location a good one for a commercial apple orchard and for poultry? As we shall want to do some general farming and are perfect greenhorns, we would greatly appreciate it if you would make out a list of just what machinery we ought to have to get our crops in and out of the ground with the least expenditure of time and effort. As there will be only two men on the farm we want the implements that do things in the latest style, and we want to start in with the proper equipment, but no frills. We all love to work and fancy we shall be satisfied in that respect on this farm. Do you think we can make a "go" of it?

New Jersey. E. D. A.

Given a 240-acre farm in Vermont, 100 acres tillable, 50 acres pasture and the remainder assumed to be woodland, what advice may be given by letter to the prospective purchasers of such a farm (who are self-nominated perfect greenhorns) as to how to proceed to develop an orchard on this farm and make a living in the meantime, what machinery to buy to do the work efficiently, etc.? Since the prospective buyers of this farm live outside of Vermont I would advise them, first of all, to visit this farm in the Spring, when the ground is bare of snow, and satisfy themselves that the farm is as represented. I would advise them to talk with disinterested persons in the neighborhood about the farm, and get all the information possible concerning it. I would advise a person never to buy a farm at a distance, which he has never seen, on the word of a party unknown to him, unless information is obtained from disinterested parties of known responsibility. Many cases that have come to my notice of disappointment and failure would have been avoided had these precautions been followed.

This question is also hard to answer, because no information is given as to the financial ability of the purchasers. If sufficient capital can be commanded it would, of course, be best for an experienced person to at once plant out an orchard of the size desired. But for an inexperienced person with capital to do this would be to invite a chance of failure and for an inexperienced person with short capital to do it would be to invite disaster. I would advise the planting of a few acres for the first year in order that experience might be gained.

I would pick out some of the land best suited to orcharding and set out the trees, after having plowed the land deeply and having thoroughly harrowed the soil. Not, however, being an orchardist, I do not feel competent to give specific advice in this connection. I would raise between trees some crops in order to pay the expense of cultivation. Potatoes, beans or a low-growing flint corn might be used for this purpose. That portion of the meadow land which was well seeded with clover or grasses I would top-dress with chemicals. A dressing of 250 pounds per acre applied in the early Spring, about the time the grass begins to start, of a fertilizer made up of 1,000 pounds of nitrate of soda, 700 pounds of acid phosphate, 300 pounds of muriate of potash, would give a great stimulus to the grass crop. The portions of the meadow which did not give promise of a good crop of grass I would plow and sow a part to oats or barley and plant corn on the rest.

These are simply suggestions as to how the land may be handled in order to raise crops which may be used in feeding stock and poultry, although this may not be the best way of handling it. I dislike nothing so much as to give advice of this nature at long range, without knowing the farm or the circumstances of the owners, because I feel that such advice is not likely to result in all cases in benefit to the recipients. Apply to the Extension Department of the University of Vermont for advice regarding the handling of the farm after possession is taken. E. S. BRIGHAM.

"MY FRIEND, THE DOG."

Every time we print the word "dog" in THE R. N.-Y. we seem to start up a combat. Evidently there are a large number of people in this world who have absolutely no use whatever for a dog. These dog haters, for such they may clearly be called, believe that a dog has no redeeming quality whatever; that he conveys the disease of rabies, that he is an untamed, ungrateful and thoroughly useless animal, liable to bite and destroy his playmates at any time. Others go so far as to say that those who keep dogs and make so much of them do so because the ignoble nature of the dog prompts him to fawn upon such people and give them a sort of devotion which they could not possibly command

AIREDALE TERRIERS AT PLAY. FIG. 158.

from human beings. They also refer to what they call the senseless folly of women who lavish their affection and their money upon these useless and pampered dogs when there are children lacking proper food within gunshot of them. That is one side of the story.

On the other hand, whenever the dog is up, we have numberless letters from people who claim that the dog in general, their dog in particular, is next to the human being in intelligence, devotion and power of affection. These people give instances which they think prove the position they take. We have letters from people who tell how faithful old Dick or Shep saved the lives of their children or lost their own lives trying to protect their master's property. Right in the same mail will come letters from the dog haters who tell of friends stricken with hydrophobia which came from the mouth of some useless dog.

There seems to be no way of reconciling the dog lovers and the dog haters and bringing them together into any fair compromise. It is a fight to the death on the part of the dog haters and a defensive fight on the part of the dog lovers. We should say that the latter are gaining ground, as dogs are bred more carefully and trained with greater system.

As a contribution from the dog lover's side we show the pictures which are given at Figs. 158 and 159. The owner of these dogs, Mr. Lowder, gives the following note about them. Surely here is a case where the dog is useful, yet the dog haters will have their arguments ready to show the folly of keeping these animals around.

"WORKING LIKE A DOG." FIG. 159.

"I thought perhaps it might be of some interest to the readers of THE R. N.-Y. to know the usefulness of the Airedale on the farm. The enclosed pictures show my dogs at work. My place is entirely free from vermin, they haul my kindling wood, and make themselves very useful in general. They are the best watch dogs, as I have a poultry plant and have never lost a bird from night prowlers, etc. They are an all-around dog, and the most teachable I have ever owned." WM. A. LOWDER.

New Jersey.

THE PRUNING OF APPLE TREES.

PART II.

The orchard tree is an artificial tree in every way. The object in cutting back the young growth is to balance the tops and remove weak or diseased wood, also to remove the terminal fruit bud from the leading shoots of varieties such as Yellow Transparent apples. Where trees are properly fertilized and cultivated there should be little call for cutting back, aside from occasional pinching back of the stronger tips during the growing season so that the tree will not be one sided. This work need not be expensive and the writer has found that removing these growing tips when the twig has reached a length of from 14 to 18 inches will produce better shaped trees, with stronger limbs than trees gone over once a year after growth has stopped.

By going over the trees twice during the growing season the trees can be kept in the best shape, and it also gives one the opportunity to remove young watersprouts and suckers before they have used much of the food needed to produce good limbs. That old adage, "an ounce of prevention is worth a pound of cure," is just as true in the pruning work as in any other. The chief difficulty lies in the finding out what to prevent. The question of disease is an easy one so far as pruning goes. It is only a matter of thoroughness and getting at it in time. It is the determining and producing the ideal shape for a practical tree that puzzles the average man who attempts the pruning of young trees, as there is much discussion between various growers as to the proper shape for a fruit tree. Some claim that a central stem should be retained and series of side branches be trained from this at various heights. This will do very well for the first 20 years or so of the tree's life, but after that the top will grow so much faster than the lower set of side limbs that these lower limbs will be crowded and become worthless unless an expensive system of pruning is practiced to restrain the growth of the upper limbs.

There are many reasons why the modified vase form is the ideal tree. It gives a round head with an open center, which at once is the most economical to prune, spray, and to harvest fruit from. The open head admits sunlight to the center of the tree, which increases the general health of the tree as well as the quantity and quality of the fruit. If a main limb is partly or wholly lost, one can fill the gap more easily than he could if the tree had a central stem.

We cannot do efficient work if we do not have the proper tools. An ax is about the worst tool that could be used to prune a tree with. It cannot be used with any degree of accuracy or safety, and it is almost impossible to do a neat job. In spite of this we find many people hacking at their trees with an ax and thinking they are doing a good job. On the other hand we find people spending much money on tools they cannot use to advantage on a practical job. There is almost as much money wasted on needless and unpractical pruning tools as has been wasted on the worthless iron spray outfits found on nearly every farm. It is amusing if not at times pathetic to see someone climbing around an old apple tree, cumbered with an assortment of saws, shears, and numerous hindrances to rapid and efficient work. A good narrow bladed saw, with teeth on only *one* edge is the best tool to use for the most of the work in the older trees. For very large limbs or stubs, an ordinary carpenter's hand saw with about seven teeth to the inch should be used. This makes a clean smooth cut and does the work with a fair degree of rapidity. A pair of the best quality hand shears is the most efficient tool for work on young trees. Cheap ones are worse than useless on a practical job. A pair of long-handled clippers are useful where suckers are to be removed from around the roots of the tree.

Pole pruners with a 12-foot pole are useful to help remove brush as well as to cut small twigs and branches that cannot be reached easily from the inside of the tree. A ladder and paint outfit will be needed for work on larger trees. Experience has taught that these tools are all that will be required on any job one might be asked to do, excepting the treating of decayed places in limbs or trunk. When young trees are being pruned only the hand shears and small saw are used; while in old trees each one of the whole outfit will come in play at sometime or other. Above all things get the *best* tool of its kind that can be bought. The buying of proper tools is not a hard task; it is the using of these tools properly that taxes mind, body, and last but not least, patience. Patience and lots of it is an important factor in all lines of fruit growing. The tools should be kept sharp if one expects results.

R. B. GILMAN.

New Jersey.

Spring Rye and Clover.

I am thinking of sowing a small field with Spring rye, seeding with clover, in the hope of getting some grain for feeding and a crop of clover to turn under the next Spring. What would you advise? Can we expect a fair crop of grain from the Spring rye? H. C.

Our advice would be to sow beardless barley in place of the spring rye. This barley will give you more grain to the acre and feed of a higher quality. It gives also a better crop to seed the clover. Spring rye will do very well in some localities. It grows through a longer season than the beardless barley, and makes such a rank heavy growth that the clover does not have a fair chance.

"WHY do you insist upon having the biggest share of the pudding, Harry?" asked the mother of a small boy. "Isn't your older brother entitled to it?" "No, he isn't," replied the little fellow. "He was eating pudding two years before I was born."—Tit-Bits.

THE NEW BERRY CULTURE.

PART II.

The most important point in all this system is thorough cultivation, which means cultivation right through the picking season. With the new canes nearly full grown and the bearing canes maturing a crop of berries in the hottest and driest time of the year, it is of the greatest importance that we save every drop of water possible. The pickers tramp the surface until the sun has the best possible chance to get the water. For best results the patch should be cultivated after each picking. Any lack of moisture at this time will quickly, and surely reduce the crop and under the common system, where cultivation is discontinued when picking begins, this lack becomes so serious as to bring an excessive strain on the vitality of the plant, which shortens its lifetime. This is one reason why cane berry plantings are exhausted and useless at four, five, or six years, when they should be vigorous and profitable at twice the age.

We allow not more than six canes of red raspberries in one hill, and four or five of blackberries are plenty. All new canes are carefully removed between hills. It is worse than useless to allow more canes to grow than are needed, as we are certain that we get more fruit from this number of canes than we could from twice as many. It is very important that the row be kept narrow. All canes that come up outside the row are taken out, no matter how vigorous they may be. The canes are allowed to grow to their full height without any cutting or pinching back.

The red raspberries are spread out fan-shape and tied, spacing them so that they are an equal distance apart all along the upper wire. Then the tops are cut off, leaving them 5½ or six feet high. Were we sure of plenty of moisture we would not trim at all. With the blackberries there is an important difference in pruning, because they positively will not produce berries on the part of the canes that was much shaded last year. The first year there is no shade; the second not much, as the new growth is much higher than that of the first year, but after the canes reach their full size, the new shoots must push their way up through a mass of bearing canes, and the first four or five feet is so shaded as to be almost useless as far as the fruit it bears is concerned. This may be the reason some say the second crop is the best they ever get. After the second year we bend the canes down over the upper wire, tying the tip to the lower wire onto another cane when more convenient. If they have branched freely we cut out part of the branches, or take out entire canes, always remembering the top is the best part of the cane. Then our new canes grow up from three to five feet above the old growth, and have the full benefit of the sunshine, while the bearing canes ripen their crops just as nicely while partly shaded.

This tying takes time and patience, but we must have the canes all snug in a space which should not be more than a foot wide at the bottom so that the cultivator may be run close. We have a cultivator four feet wide with adjustable handles which may be set to one side, so that after the fruit spurs grow and the rows spread out above, the cultivator may be held close to the row without scratching the hands. It also has a set of V-shaped sweeps, which are used to cut off all the suckers that come up between the rows. Two horses and a spring-tooth harrow may be used for awhile in the Spring, but after the berries form and the rows have widened out we use the single cultivator.

The soil should be good, but the berries do not seem to require heavy fertilization. We use commercial fertilizer rather than manure, as we have been getting all the cane growth we want, except when our red raspberry canes were damaged by June freezes the last two years. I consider the moisture problem far more important, and difficult than the fertility, for, with berries selling at from $2.50 to $5.10 per bushel, we can easily afford to buy all the fertilizer needed.

Few growers realize how sensitive the red berries are to any lack of moisture, or that they almost never get the entire crop to mature. The crop may be reduced one-third to one-half without the grower having noticed that, unlike the other berries, the red raspberry, when the moisture runs short, will concentrate its energy on the berries that are fairly well formed, maturing them nicely, while the small ones and thousands of blossoms which should have made berries die. The cultivation should be just deep enough to maintain a good dust mulch, as deep plowing breaks up the roots and does more harm than good.

This system requires about 275 posts per acre and 320 pounds of wire. We use posts somewhat higher than average fence posts, and if set with a digger many posts may be used that could not be driven. This seems like a heavy expense to begin with, but it is done once for several years, and when the crop returns are from $200 to $400 per acre we can well afford it. We claim for this system that it produces very much larger yields, that the berries are more easily picked, and that the profitable lifetime of the planting is doubled, compared with berries allowed to grow too thick and not well cultivated. The writer saw in one day one patch of blackberries, one of red raspberries and one that contained both which were 14, 15 and 17 years old respectively, and all were still vigorous, and profitable. These berries were growing on a very deep soil which, while the surface was well drained, had a permanent supply of water only a few feet below. It was on this soil that the large yield mentioned was grown. Within a mile was another field of red raspberries on a different type of soil which produced very well for the first few pickings, then stopped short, while those with plenty of moisture were just about in the middle of their harvest. We need a fertile soil, but fertility is of little value when the water is exhausted, for plants can take their food only in a liquid form, and we cannot make soup without water B. V. EGBERT.

"Mand's Wonder" Forage Plant.

I have just seen in a 1914 catalogue a picture and a description of Mand's "Wonder Forage Plant." The statement is made that the seed is unequalled for poultry food. Inasmuch as we are beginners in the poultry business, we would like to know if you are acquainted with its merits, especially as a food for chickens? P. P. M.

Connecticut.

"Mand's Wonder' forage plant appears to be simply Pearl millet, Pennisetum typhoideum or P. spicata, of different botanists, a very rank-growing millet of unknown origin, long cultivated in Asia and Southern Europe for forage and to a less extent for its seeds, as food both for stock and humans. It was introduced to this country with considerable flourish by mail-order seed houses about 20 years ago under the names of Pearl millet and Penicillaria as a wonderful new plant for forage and chicken feeding purposes, though it had probably long been grown in the South in a small way. Although possessing much merit Pearl millet cannot endure competition with corn and the sorghums where these invaluable economic crops can be grown, and little is heard of it now, except as a novelty crop on the trial-packet basis.

Pearl millet grows well under ordinary cover crop conditions, and if sown in rich soil with a long season and sufficient rain will grow many feet high and produce quite a lot of excellent chick-feed, but as good or better results with less labor may be had with any suitable variety of field corn or maize, or in drier localities the sorghums known as Kaffir or Egyptian corn.

As a forage plant Pearl millet will produce under favorable conditions an extraordinary amount of green fodder if frequently cut during the growing season, but if left too long the stalks soon become woody and are not relished by cattle. As a soiling crop for small areas of rich land in most warm localities Pearl millet is worth attention, but must inevitably retire before corn where the latter can be well grown. V.

MACKENZIE was having his first experience of life in American forests. Borrowing a gun, he set off one day in search of game. Not long afterwards his companion saw Mackenzie in the distance running at full speed, a big bear behind him. "Quick! Quick! Jock," Mackenzie cried. "Open the door! I'm bringing him home alive!"—London Farm and Home.

Change houses into homes!

"The farm house that's so often untenanted."

The original owner had liberal ideas—big, airy rooms; plenty of big windows to let in the light and wholesome sunshine; and big, arched openings between the rooms instead of cumbersome doors. But he made the one big mistake—he put in old-fashioned heating—and he and every succeeding owner and tenant has found the place "big and barny"—so full of chill corners, drafty passageways and cold floors. In thousands of such farm houses formerly handicapped by old-fashioned heating it has since been proved that the one unfailing way to cure houses of cold and lack of tenants is to put in an outfit of

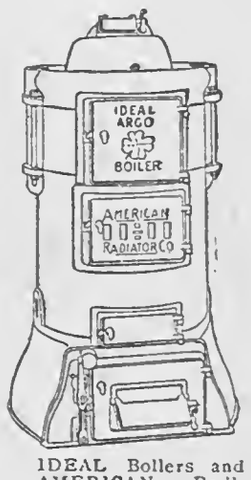
AMERICAN RADIATORS & IDEAL BOILERS

For the 3-room cottage up to the largest public building, we make IDEAL Boilers and AMERICAN Radiators in every size and kind exactly suited to the needs and incomes of farmer, wage-earner or salaried man.

IDEAL Boilers are made in different forms to burn to highest heating advantage hard or soft coals, screenings, run-of-mine, coke, wood, oil, gas, etc. Their heating capacities and economies are figured from scientific standards—fuel-holding capacity; fire and flue heating surfaces and their position (around and over the fire); time each fuel charge will last; draft and check-damper heat regulation, etc. These things are absolutely *known*, so that he who pays the fuel bills can be sure to get the highest possible heating results and economies from every pound of fuel—*and with the simplest care-taking.* Need not be connected to water supply pipes; the same water is used over and over, for many years.

A No. 4-22-W IDEAL Boiler and 400 ft of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this cottage
At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which are extra and vary according to climatic and other conditions.

If you have a farm or town home, store, church, school, bank, hotel, etc., that is lacking in cozy warmth, let us send you our full story of cleanly, healthful IDEAL Boilers and AMERICAN Radiators that will last for scores of years. Ask for book (free): "Ideal Heating."



IDEAL Boilers and AMERICAN Radiators keep a NEW house new and cause an OLD house to have its life and value prolonged

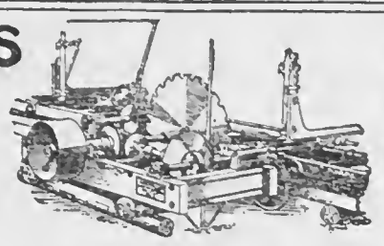
SAW 10 LOGS WITH AN AMERICAN SAW MILL



AND GET LUMBER WORTH $25 TO $40

Ten 16 foot logs averaging 14 inches thick make 1000 feet of lumber worth $25 to $40 in your local market. Costs you only $4 to $5 to saw 1000 feet with an "American" Portable Saw Mill. Think of the profits! Why, that timber on your wood-lot is just like wheat. Reap it with an axe. Harvest it with an inexpensive, light running "American" Portable Saw Mill you can operate yourself. No experience needed. An 8 H.P. gas engine and an "American" mill saws up to 2500 feet per day. Get an "American" because it saws more and better lumber with less help and power than any other. Make big money every winter when the farm doesn't need you. Hundreds of farmers are doing a paying lumbering business with "American" mills. You can do the same, for there are wood-lots around you if you have none yourself. Read enthusiastic letters from farmers in our free Book No. 26 that tells all about farm lumbering.

If the average Farmer is as shrewd a merchant as he is said to be—and we *know* he is—the fact explains why so many Mitchell cars are in *daily use on the farm.*

It is because the Mitchell is a sturdy and lasting proposition and may be maintained with maximum economy that the farmer finds it suited to his needs. When he buys it he realizes that he has made an investment which *pays big dividends in efficiency.*

The car that does the most work, lasts the longest and can be kept up with the least expense for repairs, is *the car that the Business Farmer needs* and this we declare to be the Mitchell because years of experience have *proved* it definitely.

The purpose of this advertisement is to request you Business Farmers to go at once to the nearest Mitchell dealer, examine the car carefully, take a ride in it and *drive it yourself* so as to get the *personal feel* and the *personal touch.* If it proves its merit it is the car you want. That's the *only way* to *buy* an automobile and the only real way to *sell* one.

Equipment of All the Mitchell Models That is Included in the List Prices:

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—speedometer—Tungsten valves—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of tools.

EXPERIENCE WITH NURSERYMEN.

MAKING UP AN ORDER.—Two years ago, having decided to plant four acres to fruit trees, I sent for more than a dozen catalogues. This plan proved to be a good one, as some nurserymen seemed to be short on some sorts, and the prices seemed too high on such; while another's price might be reasonable he might not have all the varieties or size wanted. When it came to quality and freedom from disease, I only had their word for it. Besides, not having dealt with a majority of the firms I decided to divide my order. This plan also proved a good one, as some of the stock was unsatisfactory; in other cases there was delay in shipment or no shipment at all. Having spent considerable time trying to find out what few commercial varieties would probably prove most profitable under my conditions I was not inclined to want some nurseryman to substitute something "just as good" in place of varieties ordered, so I sent my orders in February with instructions to ship April 15. I was especially anxious to get just the varieties of apples ordered, as these were to be the real orchard, with the peaches, cherries, plums and dwarf pears for borders and fillers. This method of planting is open to criticism, but I am also raising poultry, and want plenty of shade. By taking good care of the trees, I hope to get several crops of fruit before it will be necessary to cut out the smaller fruits.

VARYING VARIETIES.—In reading over the average catalogue one is led to believe that each variety of peaches, for instance, is at least good, better or best. This may be true under varying conditions. Some of the most profitable varieties in favored locations are almost worthless in others. Why cannot a nurseryman state under what conditions a certain variety is at its best and tell prospective buyers what conditions to avoid? Of course this advice would of necessity be general. Of the dozen or more catalogues received just one did this. A tree may bear excellent fruit, but the tree itself may be such a poor grower or so subject to disease, or such a shy bearer, or the fruit may have some fault or defect that may make it almost worthless from a commercial standpoint, but we seldom find anything about it in the average catalogue. A long list of varieties seems very impressive to the novice, and is the means undoubtedly of making many sales as well as disappointed customers. Would there not be more profit in growing and shipping 100,000 trees of 10 varieties than of 50?

MORE INFORMATION WANTED.—There may be an excuse for so many varieties, because where one lives in a favored location he likes to grow the better sorts which might not succeed under other conditions. Why not give some hint as to the conditions necessary for a certain variety to do its best? Some varieties are described as medium to large. To his disgust the grower finds the tree bears undersized and almost worthless fruit. If the catalogue had stated that this particular variety *when properly thinned* would produce good-sized fruit the nurseryman would probably have retained a valued customer, while the latter would have got profitable returns for time and money spent, while otherwise he grubs out valuable trees in disgust, thinking the nurseryman had willfully misrepresented this particular variety or had sent him a worthless substitute.

A CASE OF CROWN-GALL.—About the middle of April the trees began to arrive. Among the first lot were some Sutton trees. After setting a few trees I became suspicious of crown-gall. Never having had any experience with this before I wanted to go a little slow. I took a three-inch section of one of the supposedly affected trees and sent it to the experiment station for examination and heeled in the rest of the "suspects" and waited for a reply. This came in due time advising me to destroy every affected tree. I destroyed just one-half of the lot. A number of Grimes were added to the Sutton's discards. I wrote the firm from whom I bought the trees. They acknowledged they had some crown-gall in their nursery, but insisted that this was of little or no damage to a tree, citing as evidence that they had been offered a price for all their diseased stock by an experienced grower. At the same time they seemed anxious to replace the trees the following Fall or Spring as I might wish. As I had set one-year-old trees I asked them to furnish me their best two-year-old trees, I to pay the difference, if there were any, so that all my trees might be as uniform in size as possible. Last Spring the new trees came and they were as fine a lot of trees as I ever saw. The bunch of Suttons had just *two and one half* tags on, one marked "Sutton," one "Wagener," the other half "Wag"—the name of the employee, I suppose who forget to remove the original labels.

LATE STRAWBERRIES.—My original order included several hundred strawberry plants. I waited till nearly the first of June and wrote them about the matter. They replied saying it was too late to ship the plants, returned the money and expressed the hope that I would see fit to order again. Neither their hopes nor mine produced many fancy berries the following season.

MORE TRIALS.—Another lot of trees from a different source contained 10 diseased trees. These were replaced as in the former case. Three out of these 10 were diseased. I am looking daily for that nurseryman's 1914 catalogue, as I am still much interested in fruit and I do enjoy looking at the beautiful products of the lithographer's art. During the last week in May I received 400 out of a thousand strawberry plants ordered from still another grower. Money was returned for plants not shipped. The weather was dry and hot and the plants, evidently, had been in cold storage. One variety especially was entirely brown except for a spindling little white sprout in the center. I wrote them about this shipment and they replied that they could not supply the other varieties, and that if I had not specified no substitution in my order they would have been able to furnish me the whole thousand plants of varieties that would do me as much good as those ordered. They did not explain why it took them three months from the time the order was received till it was shipped to discover that they were short on those particular varieties. Neither did they explain how I was to get a crop the following year from the 400 worthless plants and the 600 they didn't ship.

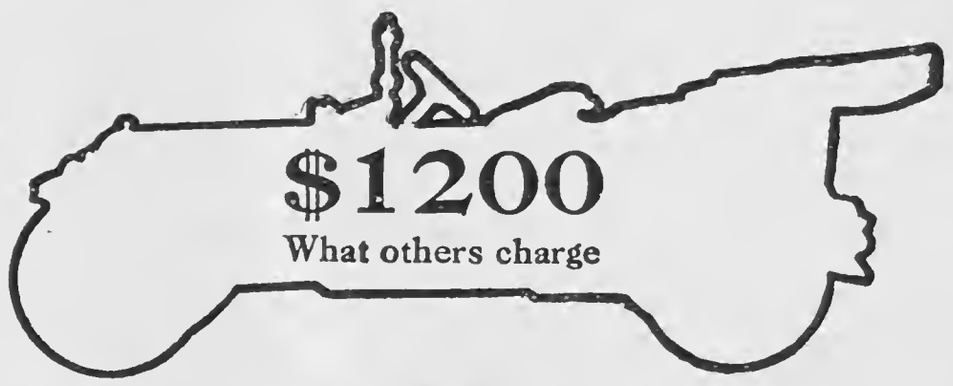
DELAYED TRAVEL.—I ordered nearly 3,000 raspberry and blackberry bushes from a nursery company less than 150 miles distant. This shipment was 19 days on the road. My father had a shipment billed out from the same place on the same day which reached here 10 days ahead of mine. Of course many of the plants died, due to no fault of the company shipping them. Out of 2,500 strawberry plants ordered that Spring, 450, all from one firm, lived and did well. In this case the plants were vigorous, fresh-dug and shipment prompt.

VALUABLE EXPERIENCE.—My experience has been of value to me. I have learned that those who toot their horn the loudest, frequently do so through necessity, and that those who make the greatest claims for honesty, square-dealing, superior stock, unusual facilities for handling orders, long years of experience, etc., do not always measure up to those who devote their catalogues to fair descriptions of their stock. I learned also that while a nurseryman's pear or apple trees, for instance may be exceptionally fine, his peach trees may be very inferior. It certainly pays, where one is to plant a considerable number of trees, to visit a few reliable nurseries, and compare quality and prices, especially the former, for, while the highest priced tree is not necessarily the best, the cheaper ones are frequently dear at any price. I have not had in mind in writing my experience in dealing with nurserymen creating the impression that, as a class, they are dishonest because this is not the case, as I found it, for I bought many lots of trees which proved highly satisfactory, and I realize that my experience taken as a whole was a little unusual. I am convinced of one fact, that is, one cannot make a fortune at once sitting beside the stove with a catalogue in one hand and a lead pencil in the other.

Ohio. J. D. PRICKETT.

HE: "I shall never marry until I meet a woman who is my direct opposite." She (encouragingly): "Well, my friend, there are numbers of bright, intelligent girls in this neighborhood."—Credit Lost.

Overland



You Think They Are Different—But Are They?

TOO many people are fooled or mislead by taking bare automobile prices as a positive indication of the intrinsic value of a car. This is exactly the wrong way to go about it. Because one article is priced higher than another it does not follow that that article has a greater value.

The picture above illustrates this point. Here are two cars practically identical. The one on the left is the $950 Overland. The one on the right is the average similar car—priced at $1200—which offers no greater value.

As a matter of fact there are any number of $1200 cars which are not, in value, the equal of the $950 Overland.

But how are we to know this?—you ask.

That's simple. Ask some real questions; find out some actual facts; make some specification comparisons—and then it is the easiest thing in the world to sum up the intrinsic value of any car made.

For instance:

The $950 Overland has a wheel base of 114 inches.

The wheel base of the average $1200 car is no longer than this—often shorter. So in this respect you get more for $950 than you do for $1200.

The $950 Overland has a powerful 35 horsepower motor.

No $1200 car has a larger motor than this. Here is equal value and, in most cases, more value for less money.

The $950 Overland tires are 33 inches x 4 inches—all around.

No $1200 car has larger tires. Again—equal value—our price $250 less.

The $950 Overland has a complete set of electric lights—throughout—the same as on most $1200 cars. Some out-of-date cars still cling to the obsolete gas lamps. In the first instance the $950 electrically lighted Overland is the value equal of the $1200 car, and in the second instance has more value than the $1200 (gas lamp) car. In either case our price is $250 less.

Next comes the matter of equipment. The $950 Overland is complete—a jeweled speedometer, top, curtains, boot, windshield, electric horn—everything complete. No $1200 car made has more complete or better equipment.

And so on throughout the car. Point for point—specification for specification, the $950 Overland is, in every essential respect, the equal of any $1200 car on the market.

So we warn you. Ignore the prices. Compare the actual facts first. Then compare the facts with the prices and you get the intrinsic value.

We are making 50,000 cars this year—the largest production of its kind in the world. And every Overland purchaser will save at least 30% and get a superior car.

See the Overland dealer in your town today. Then see any competing car. Make the comparisons we suggest. Then you will better realize how hard a comparison of this kind is, on any other car costing in the neighborhood of $1200.

Chlorosis of Grape.

I have about three acres of grapes in one piece. Some of them turn yellow and in a course of time the leaves come back to their green color again. What is the cause of this? The vines are 10 years old, have fruit but shell off badly in picking. I would like to know what makes this, and a cure for them. Not only mine but the neighbors' grapes do the same. W. C. V.

Albion, Iowa.

Apparently, similar examples of the trouble here referred to have been quite numerous during the past three years in the Chautauqua grape belt. There is of course the possibility that they may not be the same. For want of a better name we have called the trouble chlorosis, although this should not be confused with the disease of that name quite common in France, and less so in California. In the beginning the two have many symptoms that are very similar. Again, this disease resembles the California vine disease in some particulars, but at the present they are not thought to be of similar origin. This so-called chlorosis appeared first with us on vines from four to six years set; the older vines in some cases developed the trouble, but it was largely confined to the younger plantings. In most instances the worst affected vines were located on rather thin soil, the subsoil being of a silty nature, and apparently very deficient in organic or humic matter, such a soil retaining but little soil moisture. In our experiences such conditions of soil are more commonly met on the knolls and slopes.

Many of the elements known to be necessary for the growth of plants were tried as possible soil correctives, but these did not affect favorably the control of disease. The belief now is that the trouble is directly due to a lack of soil moisture at the time the demand is the greatest, and that the conserving of the Spring supply by early plowing and frequent cultivation till midsummer is very necessary. The plowing under of green manures is especially to be recommended. Vines that show the symptoms should be marked the first year and short pruning should be practiced in the Fall and Winter following. When attention to these details is given the trouble has been considerably lessened. F. E. GLADWIN.

The Ben Davis Apple a Menace.

I have come to the conclusion that the Ben Davis apple is a menace to apple trade. It does more to reduce the consumption and price of apples than anything else, and the better-looking they are the more they injure trade. You see them on the fruit stands, all polished up three for 10 cents, Rome Beauty and Paragon the same price, a novice buys a Ben Davis and takes a bite, and in the gutter it goes and he buys no more apples for six months. The Ben Davis is a worse substitute for an apple than oleo is for butter, and the Government collects a tax on oleo. A Princeton grocer told me the other day he could always tell when Ben Davis came in the market; you can find them all along the street with one bite taken out of them. I well know there are a lot of orchards of them all through the country; they should be top-worked or cut down. The first loss is always the least.

It is against the law to pass counterfeit money. Why not make it unlawful to pass counterfeit apples? Growers ought at least to be made to label them Ben Davis when they are offered for sale, and then the people who raise edible apples, with a little advertising, could sell them, and then the consumption of apples would increase 50%. Apples all look alike to the average city buyer. The grocer and the fruit stand man buy the punky Ben cheap, sell a few at high price, and there you are—the use and sale of apples cut in half. P. B. D.

Hopewell, N. J.

Eastern or Western Onion Seed.

Is there any difference between the onion seed raised in the Eastern States, say in Connecticut or Massachusetts, as to size and quality of market bulbs compared with that raised in the West, in Illinois, Michigan or California? There is a difference in price of from one-quarter to one-half. I have always used Eastern seed. W. O. S.

Practically speaking, there are three grades of onion seed grown, and sold in the open market. The first grade is produced from bulbs selected to ideal type, the second grade from bulbs as they run, without any attention being given as to their shape or type; the third grade from large or overgrown sets. Northern-grown seed is considered somewhat superior to the Southern grown, and that produced in the Northern tier of States. If fresh and equally well cleaned, etc., the respective grades are of almost equal quality, whether produced in the Eastern, Middle or Western sections. It is believed, however, by some of the largest and most progressive growers, that seed that has been carefully grown, planted in the same general locality, will give much greater percentage of marketable stock than seed brought from a distance. The first grade of seed, produced from specially selected bulbs of desirable types, frequently sells for more than double the price of the second grade seed, and four to five times as much as the third grade. The first grade of seed will produce 10 to 20 per cent. more marketable bulbs than the second grade seed, and therefore is the cheapest to plant, even though it cost more than twice as much as the second grade seed. The third grade should never be planted for the production of standard market onions; it is only suitable for the production of sets. K.

Barn of Cement Blocks.

I am contemplating building a barn of cement blocks. Is there any objection to blocks for stable for cows or horses? We have some severe weather Winters, and we do not know whether the stables would be damp. C. D.

Cement blocks and hollow tile are used extensively in constructing farm buildings, and there is very little complaint from their use after the materials have been thoroughly ripened or dried out after the structure is completed. Concrete blocks do hold the moisture longer than the vitrified blocks, and the majority seem to favor the use of the hollow tile as compared with the cement blocks. If the building, however, is located on relatively high ground so that free circulation of the air exists, and provided further that a complete system of ventilation is installed, concrete blocks may be safely used. The hollow tile blocks, however, are more durable, and in most cases less expensive, and furthermore, permit the use of the stucco finish, which has more of a finish and makes a better looking job than in case the cement blocks are used. In case of a long and continuous spell of wet weather, the cement blocks are very apt to evidence a moist condition, and dampness may prevail in the stable. The King system of ventilation should be installed in every case where cement blocks are used.

RAISE YOUR SILAGE CORN WITH

E. FRANK COE FERTILIZERS

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

HARVESTING SILAGE CORN RAISED WITH E. FRANK COE FERTILIZERS ON A MASSACHUSETTS FARM

Many dairymen often deprive themselves of the benefits of a good crop of silage corn because they do not have enough barn manure with which to raise it.

It is true that there is probably no other crop on which stable manure may be used to such good advantage as on corn; yet every practical farmer should realize that stable manure is *not a necessity* for profitable corn growing.

Says Mr. H. W. Collingwood, the able and experienced editor of *The Rural New-Yorker:* "Do not believe those who tell you that you must have manure in order to grow corn. Some of the largest yields on record have been grown with chemical fertilizers and sod."

We specialize in fertilizers for silage corn. If you will advise us of your proposed acreage and also tell us the character of your soil, we shall be glad to give you our best suggestions, based upon many years of practical experience. A letter or postal card will have prompt attention.

THE COE-MORTIMER COMPANY, 51 Chambers St., NEW YORK CITY

IMMUNITY IN HORTICULTURE.

PART II.

THE PECAN is subject to a few fungus diseases and insect pests, and there are different degrees of immunity to both among the varieties. There are a few varieties that are so subject to the "scab" fungus on the hulls of the nuts that they cannot be grown with success in certain regions, while other varieties are not affected in any degree. There is a phylloxera that infects certain kinds and a "shuck worm" in the hulls of others that makes them about worthless. Pecan growers take much care to know these facts when selecting the varieties to plant in their different sections, for they may be affected in some places and not in others, and largely owing to climatic conditions.

WALNUTS AND HAZELS.—The walnut growers of California are much troubled with a disease they call blight, which affects the young bark and the hulls of the nuts, causing them to die outright in many cases. Yet there are varieties that are not so affected and to these they are looking for relief, mainly, instead of to remedies or preventive sprays, which seem to be quite inefficient. The European hazels or filberts are affected with a fungus in the Eastern States that causes the branches to gradually die, and there seems to be no way to prevent or cure the disease. Our native species of hazel are not so affected in any way, and it may be possible to cross-pollinate the foreign and domestic species and thus produce hybrids that may have the good qualities and size of the foreign nuts and the health of our own bushes. On the Pacific coast there is no such trouble, indicating that the fungus is dependent on certain climatic conditions for propagation.

SMALL FRUITS.—Our native species of Rubus have considerable differences in immunity to the attacks of the fungus diseases that prey on that germ. Most of them are not seriously affected in this way, but some of them are, the Kittatinny blackberry being one of them. The Orange rust, so called because of its color, often troubles this variety so badly that its culture has to be abandoned. Certain varieties of the raspberry are subject to violent attacks of anthracnose that render their culture very difficult or at least uncertain of success. The strawberries are subject to several fungus diseases called rust, leaf spot and other suggestive or descriptive names. Some of the varieties are so badly checked by the injury to their foliage that their other good points are overcome and it will not pay to grow them. The Van Deman is a variety that was introduced about 25 years ago and was most highly endorsed by many of the State experiment stations and private growers, but time proved it to be very easily affected by leaf rust. This one fault has practically eliminated it from the list of approved varieties. The degree of immunity from disease of the foliage has much to do with the value of any variety of strawberry.

GRAPES.—The grapes are attacked by various forms of fungi, some on the leaves, some on the bark of the vines, and some on the fruit. The black rot of the fruit having been taken to Europe, the famous discovery of the Bordeaux mixture occurred in France as a remedy for this evil. Incidentally this discovery has been a great blessing to the horticultural world. The grape phylloxera having been taken from America to France, where it finally devastated the vineyards, it became necessary to look for resistant or immune stocks on which to graft the vines. They were found in the native grapes of Texas, mainly, and by their use the vineyards were re-established. It has also been learned that the same varieties grown there could be grown here on resistant roots and they would be successfully grown were it not for the mildew fungus on the fruit in our humid air. On the Pacific coast the arid conditions are unfavorable to this fungus and there is no such trouble in growing all classes of grapes.

VEGETABLE BLIGHTS.—Immunity growing vegetables is something greatly to be desired, but unfortunately there is very little of an encouraging character among the kinds affected by disease. Many things are naturally exempt, but others are badly affected. Breeding with the purpose of obtaining immune varieties has been done quite extensively and with some slight success. In some of the leading melon growing sections blight has become a serious menace to the industry. The citron or "pie" melon being resistant to the blight, crosses have been made with it on the leading varieties of watermelons and immune varieties produced. Some of these have been thought to be good enough in quality to be worthy of general planting and at least one has been named and sent out by the U. S. Department of Agriculture. But the verdict of the public has been against its quality, which partakes too much of the male or citron melon parent. A blight-proof variety of cantaloupe was discovered in one of the Northern States and it was thought that it would be a boon to the Southern growers. But it proved a disappointment, for it was not immune to blight there. Tomato blight is another very serious disease. Long-continued efforts have been made to produce resistant varieties, with but very poor results. With beans there has been considerable success. There are a few varieties that will resist the diseases to a considerable extent. One variety of asparagus has been developed that is largely immune to the blight that makes its culture difficult in some sections.

In taking a view of the whole subject of immunity of vegetable life to disease there are some encouraging facts, but not so many nor so clear cut ones as we would wish for. The fortunate advances that have been made by accident mainly or by nature herself, are suggestive of what may, possibly, be accomplished. There is a wide-awake force of experimenters at work on the problem and we hope for more success than has as yet been attained. H. E. VAN DEMAN.

Potash for Oats.

Can anyone who has had experience in using potash with drill for oats tell me whether it will prevent oats from lodging? Which is the best for oats, sulphate of potash, kainit or muriate of potash, and how many pounds to the acre? My soil is a rich clay. G. H. D.

Massillon, Ohio.

Write to the Ohio Experiment Station at Wooster, Ohio, for a copy of their fertilizer experiment. There you will find some reference to the use of potash, long used upon most Ohio soils. Potash as a separate element does not give very profitable results except upon the lighter sandy soils. It is not likely to be needed on your soil. Probably on heavy soil to prevent the lodging of the grain, the kainit would be the best form of potash. It contains a large amount of salt, and this has the effect of stiffening the grain to some extent, and holding back rapid nitrification, and thus preventing a too rapid growth of the oat. Use 250 pounds per acre. This is not a sure preventive of lodging. This only takes place usually on very rich soil, or where a large amount of soluble nitrogen has been used. The use of kainit, however, for this purpose has proved satisfactory in a number of cases. It is also thought by some that the use of potash in this way helps to overcome certain plant diseases which are found on rich soil and in a damp season.

Roses on Sandy Land.

Can I make rose bushes grow on poor sandy land? Some say it cannot be done.

Franklin, N. H. O. E. K.

Roses succeed in any garden soil that is free from standing water and properly drained; if it is very light it may be modified by adding clay and leaf mold. These should be very thoroughly spaded in. If, in addition to this, you give a good mulch of manure every Fall, forking it in in Spring, you will, in a few seasons, greatly improve the soil. Every effort should be made to add humus. We have seen roses growing well on a sandy soil, where this practice was carried out.

"DID your watch stop when you dropped it on the floor?" asked a small boy of his friend. "Of course," was the answer. "Did you think it would go through?"—Credit Lost.

GET MY BIG FREE BOOK OF Buggy Bargains

I am proud of it! I think it's the best book ever issued. I want you to have it, even if you don't think you will buy a buggy this year. It tells the story—how my buggies are built, how they are tested in ways no "store buggy" can stand, shows lots of photographs of the work in the factory, illustrates finished "jobs" in colors, tells how to select your own choice as to style, color, upholstering, etc.; best of all, it proves that when you buy a BOHON "BLUE GRASS" BUGGY

YOU SAVE $25 TO $50

You see I sell you direct from my factory—no dealer, agent or salesman to draw profits or expenses. It's all explained in this book, together with my 30-day free road trial offer, backed by a legal $30,000 guarantee bond, etc. So just send for the book—a postal will do. DO IT TODAY.

Mulcher and Seeder

A mulcher, smoothing harrow, cultivator, weeder and seeder—all in one. Forms dust mulch—a blanket of loose soil—preventing soil hardening and moisture escaping. Increases yield of corn, potatoes, oats, wheat, etc. Kills weeds. Has *flat teeth*, especially adapted to form mulch. Lever and pressure spring control depth of teeth. Sold with or without seeding boxes for grass seed, alfalfa, oats, etc. Teeth cover the seed. Adapted for a large variety of work. Three sizes, 8, 10 and 12 ft. Shipment from branch near you.

Box 842, Utica, N. Y.

Now the Last Step

In Reo the Fifth

We take this year what seems to be the last step in quality, beauty, equipment and price.

The chassis embodies the best Mr. Olds knows after 25 years of car building. A better-built car cannot be conceived.

The body is the new-style streamline body, the coming vogue. More beautiful lines are unthinkable.

The upholstery is deep and rich. The finish is perfect. The equipment includes all that motorists desire.

And now comes a new price—a record price on a car of this class and quality.

Price $220 Less

The price this year is $220 less than last year's model, similarly equipped. That saving is mainly due to this: All the costly machinery for building this chassis has been charged against previous output. That cost is all wiped out. From this time on, so long as we build this chassis, this big item is omitted from our cost.

No other factory in America could offer you a price of $1,175 on a car built like Reo the Fifth.

A Costly Car

Reo the Fifth is built in a most unusual way. The steel is made to formula, and each lot is analyzed twice. All driving parts are given 50 per cent over-capacity. Gears are tested for 75,000 pounds per tooth. Engines are given five long, radical tests.

There are 15 roller bearings, 190 drop forgings. Each car is built slowly and carefully. Close-fitting parts are ground over and over. Tests and inspections are carried to extremes.

We could save at least $200 in the hidden parts if we built you a shorter-lived car. But you get here low cost of upkeep. You get freedom from trouble. You get a car built to run for years as well as it runs when new.

Reo the Fifth is built for men who want the utmost in an honest car. For men who buy cars to keep. For men who want safety and staunchness. It is the car of super-strength.

A thousand dealers sell Reo the Fifth. Ask for our catalog and we'll direct you to the nearest showroom.

Oak Sawdust and Mulch

I can get all the oak sawdust, about three years old, I can haul. Would this do to put on a one-year asparagus patch and one-year-old rhubarb? Would it be of any value in way of manure?

Terra Cotta, D. C. J. Q. B.

Oak sawdust at three years of age would be too raw to apply to growing crops, as the large per cent. of tannic acid contained in the wood and bark of the oak cannot be entirely dissipated until the wood is pretty thoroughly decomposed. The decomposition of the sawdust can be hastened by composting it with equal weight of horse manure for three or four months. The heating of the manure will in a great measure neutralize the tannic acid, and convert the sawdust into manure with a fertilizing value equal to about four-ninths that of mixed barnyard manure. K.

Trouble With Rambler Rose.

I have a Crimson Rambler rose that every year, as soon as the buds form, is infested with some kind of an insect that causes the leaves to curl and fall off. I have sprayed it, but it does not seem to do any good. Could you tell me what to do for it? J. S. N.

Millington, Md.

You do not describe the appearance of the leaves, but we suspect the trouble is powdery mildew, rather than an insect, as this is a common trouble, and often a severe one, with Rambler roses. It is very likely to appear where a plant is placed against a house or porch, or in any place where there is insufficient air drainage; it also follows a sudden chill. Cold nights following warm and humid days commonly result in mildew; in the greenhouse a cold draught often causes it. Grayish spots, spreading into a film of flowery white, gradually cover the affected foliage. When the trouble is uninterrupted, young shoots and even flower buds become curled, distorted and reddish, foliage withers and falls, and the whole plant is affected. The trouble may be controlled by the use of sulphur. When first noticed dust dry flowers of sulphur over the leaves in early morning, while the foliage is damp, so that the sulphur will stick. Spraying with potassium sulphide, one ounce to two gallons of water, is more effective, though the dry sulphur is satisfactory if the trouble is not too far advanced. Bordeaux spray is also used. In greenhouses sulphur compounds are evaporated, commonly on the heating pipes, to control mildew, which affects many other plants besides roses.

Country Stores and "Drummers."

In these days of cheaper transportation the question is often asked "Will the mail-order business drive out the small dealer?" To me it seems that the question is not "Can we afford to do without the country store?" but rather "Shall we be compelled to do without it?" A few facts which I have observed convince me that if they do continue to exist, the merchants will have to make some changes in their methods of buying goods. I live on a cross-country road midway between two stores whose owners try in a modest way to carry stock of all the staple articles used by farmers in these localities. The number of traveling salesmen who visit these stores would seem incredible. There are three hardware, two grocery, two dry goods, two harness, two shoe and one or two hat drummers, who come more or less regularly, besides an occasional tobacco, soda, fruit and numerous medicine men. These men have teams and driver, and their respective salaries range all the way from $900 to $1,800 per year. Of course this expense must be added to what the farmer is expected to pay for his goods. These merchants are our neighbors, fellow citizens, and we want to see them prosper. Their stores are a convenience to us, but the temptation to order some things will always be great while they can be bought cheaper from the mail-order houses. I think most of the wholesale houses send out catalogues anyway, but cannot understand why then a man must be sent to sell the articles catalogued. The time is doubtless near at hand when some stirring changes will be made in the manner of buying. F. A. C.

Missouri.

More About Broom Corn.

I saw an article written by W. J. W., Garden City, N. Y., about broom corn. He says when fully ripened to bend it down so as to straighten the splints. He will find it will be much better not to break it down, and to cut it as soon as the blossom will shake off the least bit. Cut it and clean it, put in the shade to dry, do not wait for the seed to get ripe, but cut it while the seed is in the milk. It is the old way to break it down and let it hang until ripe; that makes it brittle and colors. If cut as above it will be tough and have a nice green color. I am a broom maker, and have raised some broom corn. I have a hard time getting the people here to cut their broom corn when green. All who cut it according to directions will not let it get ripe. Plant in rows 3½ feet apart, four inches apart in rows, or if in hills 18 inches apart, and leave five to seven stalks in a hill.

Clarington, O. C. M. M.

"Your name?" asked the teacher, registering a new pupil. "Arthur." "And what's your first name?" "Brown." "Oh, haven't you got them wrong? I think Arthur must be your first name, and Brown your family name. Isn't that right?" But the small pupil was not persuaded. A day or two later he announced: "Teacher, mother says Brown *is* my first name. She says I got that name when I was born and she didn't name me Arthur till three months later!" —Everybody's.

The TOWER Does It!

MILLIONS' BUSHELS
of corn added to crop by use of; and
MILLIONS' BUSHELS
lost by failure to use the
TOWER SYSTEM OF SURFACE CULTIVATION

This gain and loss applies also to beans, potatoes, cotton, etc.

This system approved by experts and by the common-sense field use of many thousands of progressive farmers in the past dozen years.

True testimonials, and our Corn Book FREE for the asking, to the farmer who wishes to raise a larger crop this season.

There's a Good Profit in Growing Corn like This

The gardener who is able to market his sweet corn and vegetables a little earlier than other truck growers will obtain better prices and a larger profit from his crops. To produce these results, your soil needs an application of a fertilizer especially adapted to its needs for growing thrifty and healthy vegetables and garden products.

Early Crop Odorless Fertilizer

contains just the right plant food elements in a soluble and immediately available form for rapid growth and quick maturity of sweet corn, early tomatoes, berries and other early fruits and vegetables. It is the most convenient and economical fertilizer you can use for this purpose. There's no waste of valuable plant food by leaching as the special fiber base holds the nitrogen, phosphoric acid, potash and lime in the soil where the plant can readily assimilate just the nourishment it requires throughout the growing season.

Early Crop Odorless Fertilizer enables you to produce bigger and better crops and to mature them from one to three weeks earlier than if you used ordinary fertilizers. 100 lbs. of this special fertilizer will produce better results than 200 lbs. of ordinary brands. You may store Early Crop Odorless any length of time without it deteriorating. Sold direct to users in any quantity—no middlemen handle Consumers Brands.

Write today for interesting book on "Soil Fertilization"—it's a regular text book on this subject. We send it free.

CONSUMERS FERTILIZER CO. 301 Longacre Building NEW YORK CITY

"Country Gentleman" Sweet Corn—grown by Consumers Fertilizer Company with Early Crop Odorless Fertilizer, on their Experimental Farm at Farmingdale, N. J., on light sandy loam soil.

Successful Crops—Clover, Alfalfa
Peas, Beans and all legumes *Successfully* grown by inoculating with
FERGUSON'S NITROGEN BACTERIA

Alfalfa Plant on left Inoculated with Ferguson's Bacteria, on the right not inoculated. From Government Bulletin No. 159.

Insures profitable crops by taking nitrogen from the air, changing it into plant food and so furnishing nutriment to the roots of the growing legume.

$2 worth of Ferguson's Nitrogen Bacteria will gather as much nitrogen for the crop as there is in $40 worth of commercial fertilizer.

Simply, easily and quickly applied. Saves fertilizer expense and valuable time. Send $2 for one acre bottle; $9 for five acres.

Send for Booklet on Nitrogen Bacteria *Agents Wanted At Once to Act for Us*

Allen's Strawberry Plants Bear Large, Luscious Fruit

YOUR success as a fruit grower depends largely upon securing berry plants from carefully grown stock. You are sure of the quality of all berry plants and small fruits when you

Buy Allen's True-To-Name Varieties.

We have all the best of the new and standard varieties. Hardy, prolific plants grown in the nursery with nearly 30 years successful experience back of them. Allen's Strawberry plants will yield bigger, better crops.

All Shipments of Plants Guaranteed to be carefully packed—to be from fresh stock and in good condition.

Allen's Book of Berries for 1914

This book is profusely illustrated and full of valuable information to fruit growers. Tells how to plant and cultivate Strawberries and other small fruits. It also lists and describes Allen's True-to-Name Blackberries, Raspberries, Currants, Grapes, Asparagus, etc. Every gardener, farmer and fruit grower should have this 1914 Berry Book. Write today for free copy.

W. F. ALLEN 72 Market Street, Salisbury, Md.

APPLES ON LONG ISLAND.

PART II.

TREES TO PLANT.—For low-head trees special orders must be given the nurseries, as in this section they trim trees high in the nurseries. Rub off all buds below the point limbs are desired, say 2½ feet, and cut off top at desired height, say four feet, cut out all limbs except three to five at desired points and cut limbs left back to about six inches long. Trim and cut off injured roots and plant. I recommend trees for planting one-half to five-eighths inch in diameter, four to five feet high.

SOD MULCH OR CULTIVATION.—I have tried both and have concluded that cultivation with cover crop is the best for my conditions here. I have lost several hundred trees from mice under sod mulch. The mice eat the bark from the roots for several feet from the trunk in all directions.

MANURE OR FERTILIZERS.—Manure is good when trees are young, but when bearing age approaches for this section fertilizers give best results in connection with cover crops or cultivation.

SPRAYING.—This is a necessity here. I use two power sprayers and when possible keep them both at work, but have one for use in case the other breaks down, as they often do. Diseases here are mostly scab and orange rust. Insects are scale, canker worm, Codling moth and aphis, the latter occasionally is the most persistent.

TRIMMING.—Trees are trimmed somewhat open to air and light, by removal of whole branches as much as possible; do not trim too much. Mounding as a protection against mice is much recommended; if you mound up around trees remove in Spring and then next Fall mound up new again. If not do not mound up, as the wind causes the tree to make an opening in the top of the mound in which the mice get at the tree above and below the ground and the mound protects the mice and not the tree.

COVER CROPS.—I have tried cow peas, Soy beans, clover, vetch and turnips. All are good; this last year I planted Crimson clover and turnips, which will be turned under with the natural growth of grass and weeds in the Spring.

VARIETIES.—My list of varieties tested is very long, 10 times as many as there should be. When I began planting 12 years ago there were many varieties recommended, and this was a comparatively new apple section, so I planted many varieties, though comparatively few for main trees. The newer varieties were mostly planted as fillers, so even if many or most of them are comparatively worthless, some few are very good, and in the long run we gain from the knowledge obtained. I will go through my list as planted and give my opinion based upon my experience with the varieties on Long Island. Of these varieties several were supplied by the nurseries in place of varieties ordered without my consent or knowledge. My comments apply to this section and class of soils; in other localities different results on some varieties would be obtained. In most cases 20 or more trees of a variety were planted.

Alexander: trees make fair growth, fruit red, large, showy, but not abundant, not desirable.

Akin: trees make good growth, fruit red, small, bear well, not desirable because of small size.

Arkansas Black: trees make good growth, fruit dark red, medium in size, bear well, poor quality, not desirable.

Baldwin: trees make good growth, fruit red, medium to large, good quality, keep well. Trees slow to bear; from between 300 to 400 Baldwin trees planted as main trees only about three barrels of fruit were obtained. They are not yet ready to bear. From trees in the neighborhood and my own fruit as obtained so far the Baldwin is one of the best trees to plant here.

Ben Davis: trees make good growth, fruit medium to large, red, fair quality, good bearer annually; one of the best apples for commercial use either as main trees or fillers.

Black Ben Davis: trees make good growth, fruit dark red, fair quality, similar to but not as good a keeper as Ben Davis. Fruit medium, not as desirable as Ben Davis.

Benoni: tree good grower, upright, fruit red, good quality small, season Summer, production every other year, sells fairly well, but too small; not desirable.

Bismarck: trees moderate growers, fruit red, large to medium; poor to fair quality; season October to November. Good Fall apple for fillers, but not desirable for main trees.

Beach (Apple of Commerce): trees good growers, apple small to medium, red, fair quality, not desirable.

Boiken: trees fair growers, fruit yellow, medium to large, good quality, season Fall, not desirable commercially.

Coffelt: trees moderate growers, fruit red, small to medium, poor quality, not desirable.

Chicago: trees moderately vigorous, fruit red, medium size, poor quality, not productive; not desirable.

Champion: trees moderate growers, fruit red, medium size, fair quality, productive, good keeper; good for filler as it bears young. Not desirable for main trees.

Red Canada: trees moderately vigorous, fruit red, small to medium, fair quality; not productive, not desirable.

Charlamoff: tree poor grower, Summer apple, poor quality, not desirable.

Duchess of Oldenburg: tree poor grower, fruit striped red, medium good quality, suitable for filler; bears well and young, not desirable for main trees; season late Summer.

Detroit Red: trees good growers, fruit red, large, good quality, early Fall; fairly productive, not desirable.

Delicious: trees good growers, apples red, small to medium, high quality, good keepers, bears biennually; fruit subject to scab; one of the best Winter apples for family use, but not desirable commercially in this section.

Esopus Spitzenburg: trees good growers, fruit red, fine quality, beginning to bear 1913, very good for this section.

Early Harvest: trees good growers, fruit small to medium, sweet, yellow, not desirable.

Early Melon: trees fair growers, not productive, fruit large, yellow, fair quality, not desirable.

Fameuse: trees good growers, fruit red, small to medium, fine quality, season late Fall; good bearers, desirable.

Fallawater: tree fair grower, fruit yellow, large, not good bearers, not desirable.

Fall Pippin: trees fair growers, fruit yellow, large, fine quality, Season Fall, poor bearers when young; a desirable Fall apple.

Florence Crab: trees fair growers, fruit red, medium to large, for a crab, bears abundantly, a good crab apple, season Fall, desirable for a crab.

PETER ELBERT NOSTRAND.

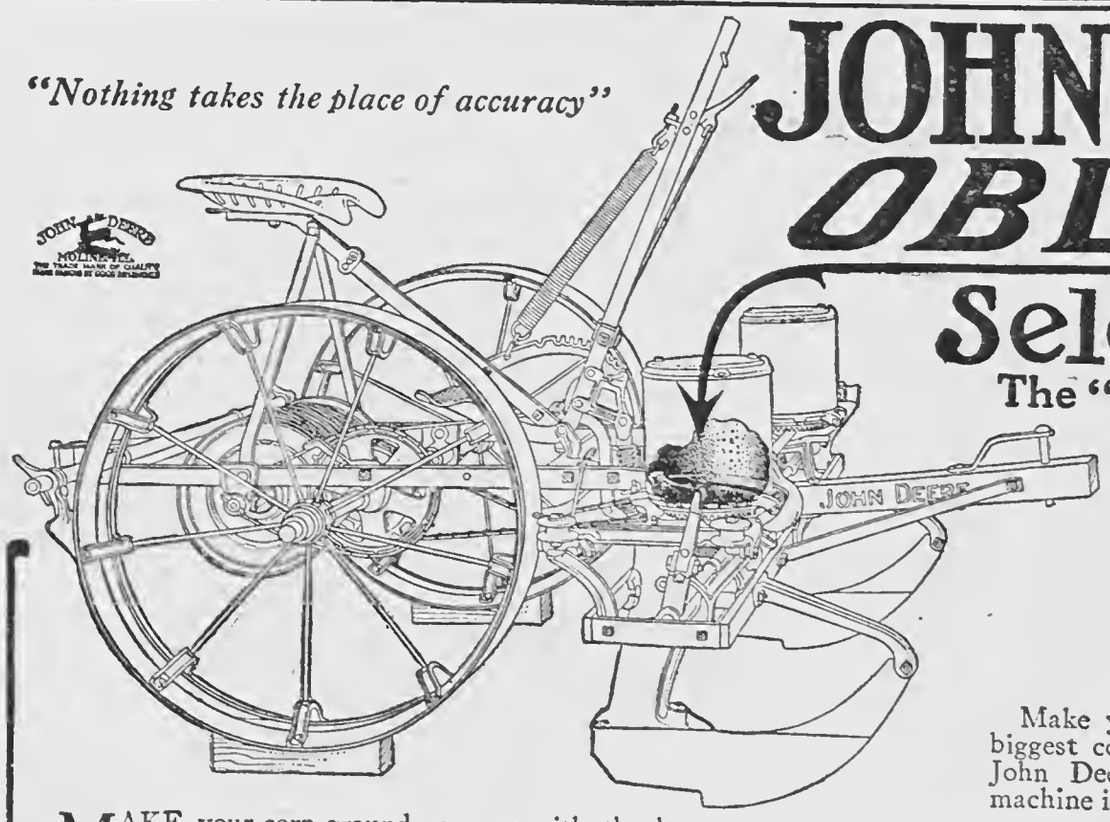
"Nothing takes the place of accuracy"



JOHN DEERE OBLIQUE Selection

The "Natural" drop

This machine maintains high accuracy even with ordinary seed. With well selected seed its dropping accuracy is practically perfect.

MAKE your corn ground pay you with the largest possible yield, by making sure that the required number of kernels is in each hill.

The seed must be there. Every "miss" means just that much thinner stand. No amount of cultivation can make up for inaccurate planting. The loss of one ear from every hundred hills costs you the price of one bushel per acre.

For years the John Deere Company has concentrated on accuracy in planting devices. The "Oblique Selection" solves the problem.

The results of its use are so profitable that many corn growers have discarded the best of previous machines. It is as far ahead of the old Edge Drop as it was ahead of the round hole plate.

Make your spring planting the start of your biggest corn crop by accurate dropping. The John Deere "Oblique Selection" will do it. The machine is a splendid investment.

Free Book Gives Valuable Corn Facts

Write us today for free booklet "More and Better Corn". It tells you why the average yield for the United States is only 25 bushels an acre, whereas better methods have produced 125, 175 and even 255 bushels per acre in places. It also describes and illustrates the John Deere "Oblique Selection" Corn Planter. The book to ask for is No. D 33

John Deere, Moline, Illinois

RANDOM FRUIT NOTES,

ORCHARD OWNER AND TENANT SYSTEM.—The orchard tenant system is not developed to the extent in Ohio, that it is in Michigan and in other States. Contrary to the declaration of W. S. Pullen of Hillsdale County, Michigan, who has concluded that the tenant system has not paid him as it should, Mr. Hutchison, of Elyria, Ohio, who is engaged in the tenant system in a smaller way, declares it pays. He states he leases the trees for three years, returns the owner one-third the crop, and in one case the owner is to furnish him barnyard manure for fertilizing the orchard. He has five sons, and has reduced the tenant system to a family affair, and divides the profits with the sons that participate. Mr. Pullen was compelled to hire all labor, figured on paying himself a salary, wear and tear on equipment and maintaining a large force in harvesting. Mr. Pullen gave one-half the apples on the trees for a five-year period. Mr. Pullen declared to the writer on several occasions that the farmer could better afford to handle his orchard than could a tenant. The farmer is convenient to the field, has his family to assist in the work of the orchard in the rush season, and the cost and keep of outside labor is less for the farmer than for the tenant. G. B. Stone and S. A. Green, Hillsdale County, Michigan, tenants, who own orchards, declare that the grower who already owns a well-developed orchard may branch out in the tenant business with greater profit and assurance of success than the man who owns no orchard and relies solely on the tenant system as his source of income and profit. Mr. Hutchison is an owner as well as tenant.

RETURNING TO BARNYARD MANURE.—The grape growers in the Lake Erie fruit belt are realizing more than ever before the value of barnyard manure as a fertilizer for their vineyards. One of the smaller growers having a score of acres in vineyard, declares that barnyard manure is his most efficient fertilizer. He has restricted his vineyard to 20 acres, keeps about 20 or 30 more acres for his dairy, and supplies from his half dozen cows a good quantity of manure for the vineyard. The vines so treated showed vigor equal to the best in the North East section, while those which did not receive the manure appeared only average. Another grower of 80 acres considers barnyard manure so essential in producing high quality of grapes, that he established a large barn for the purpose of feeding steers during the present Winter. He planned on feeding one for each acre, and should he do no better than secure gain sufficient to reimburse him for feed purchased, the manure he believed would pay for labor, interest on money, and possible loss. It is necessary for this grower to buy all hay and grain for his stock, and pay good prices. The growers generally agree that every grower should have his cow, and for the soil to hold its own, live stock will find a place in case a rearrangement should occur in the agricultural system of the belt. W. J.

MARYLAND PECANS AND PERSIAN WALNUTS.

Mr. Thomas J. Lea, in his article on page 170, entitled "Nut Notes from Maryland" shows us two things about the progress of agriculture, particularly along the lines of trees; first, the great value of seedlings to get new varieties; second, their great uselessness to propagate the new variety when it is obtained.

Mr. Lea loves trees and is planting seeds of various kinds and carefully nursing them. It is through such love that we have had developed nearly all our good kinds of trees. Let us hope that it will be continued by many other such tree lovers, but that it may also go on systematically in the agricultural experiment stations, which are in a position to do it systematically and continuously from generation to generation, once they can get their minds turned in that very practical but unfortunately slow-yielding direction.

Mr. Lea's point about his two Persian walnut trees blooming two weeks apart opens up the real point of the whole field. Every nut tree is a law unto itself. We never can tell when some wonderful quality is going to pop out, but when it does appear, we must stop the suicidal policy of trying to propagate it by seedlings. Planting seeds is fine if you are after the development of new varieties, but when you have got a new variety, you can plant 100 seeds from it, wait 20 years, and discover that 99 are relatively worthless, while one may be good. So the work of variety creation and the work of propagation are entirely different.

We should long ago have had a good Persian walnut industry here in the East if we had known how to propagate walnuts as we do apples. We now know how to propagate them, due largely to the skill and patience of W. N. Roper, of Petersburg, Va. I have found a Persian walnut tree of merit enough to try out, and am getting scions from it and having him graft me some trees which I expect to be giving me nuts in from seven to 10 years from the time I send him the scions. That is much faster than any seedling is likely to do, and then, too, I know what kind of nuts they will be, for they will be like the parent, and the tree being on Black walnut roots, will grow much more rapidly than the parent Persian walnut did on its own roots.

In conclusion, I want to urge the tree lovers to go on with their planting of seeds for the discovery of new varieties and to stop it for propagation. They must turn to the grafting knife or the budding knife either of themselves or of the expert. In the meantime, all persons having trees of even suspected merit, of pecan, or Persian walnut, or of good hickories, should communicate the important facts, along with samples of nuts, to Dr. W. C. Deming, Secretary of the Northern Nut Growers' Association, Georgetown, Conn., who is giving much valuable time to the propagation of this exceedingly constructive piece of work, which will undoubtedly give us several new industries in a few decades.

We need particularly to know how far north the pecan tree actually grows. Dr. Deming found a great big one, nine feet in circumference, in Connecticut the other day, and I think it is quite likely we shall find some pecan trees in Canada yet, if THE R. N.-Y. people just talk about it to their neighbors. Tree crops are to be the agriculture of the future. They beat the puny little grasses to a frazzle. J. RUSSELL SMITH.

"DID you see where a woman in Chicago has a dog in the house that talks sometimes?" "Well, there are plenty in more towns than Chicago who have a man in the house that growls all the time."—Baltimore American.

HIGH BRED SEED CORN
We have a limited amount of selected ears of corn, that has been bred by the ear-to-row method for EARLINESS and YIELD for the past six years in co-operation with the Plant Breeding Department of Cornell University. It is a yellow dent corn and last year yielded 103 bushels of dry shelled corn per acre, and this year over 100 bushels; tho the season was very dry. Price, per bushel of 70 lbs. of ears or 56 lbs. of shelled corn, $4. BROAD BROOK FARM, Bedford Hills, N.Y.

Bellmath Farms' Seed Potatoes
Let Us Have Your Order at Once
Pure stock of the SIR WALTER RALEIGH variety, grown from hill-selected seed, and free from scab or any other disease. This is finest quality stock, round and smooth, size uniform—about 3 and ½ tubers to the pound. The Sir Walter Raleigh is a heavy yielder and an excellent table variety. It has more good qualities than any other variety we have found. Price, $1.25 bushel. H. C. CROCKER & SON, Sennett, N. Y.

INSIST ON YOUR DEALER FURNISHING SEED OATS IN BAGS BEARING THIS TAG
Fancy Recleaned
SEED OATS
FROM
TIOGA MILL & ELEVATOR CO.,
WAVERLY NEW YORK
FRONT
These are SELECTED STOCK from which false oats, light oats and pin oats have been removed leaving only the best heavy oats. They have been recleaned to remove foul seed and dirt and before shipment have been tested to insure high germinating qualities.
If you plant oats to raise oats and get the largest returns for your work and investment, it will pay you to plant only seed that will grow and produce strong plants. False and light oats will not grow, and pin oats grow pin oats. Good oats with strong germinating qualities produce stronger plants, insuring larger returns.

Sweet Corn
I wish to let the readers of this paper know that I am still in the corn business, but do not intend to be very still about it the coming season, because I have a supply of first-rate seed, sufficient to fill many small mail orders; and I am so positive of its growing popularity that I do not hesitate to pronounce it the most desirable sweet corn in existence. It is early, tender, juicy, and surpassingly sweet—four leading qualities of the ideal corn.

REAL SEED CORN

Greenhouse Construction for Small Place.

PART I.

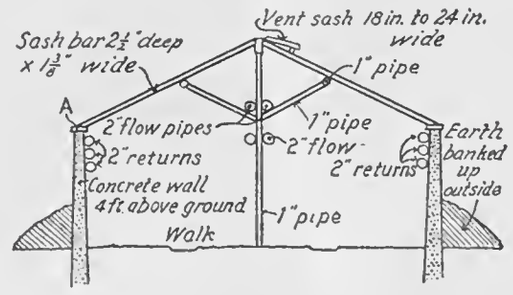
In planning the construction of a greenhouse on a small place from new material, there are several features worthy of careful consideration, the most important being location, relative to as uninterrupted exposure to the sun as possible during the entire day. If possible a location protected from either north or west winds should be chosen. Whether the house shall be built north and south, or east and west, depends somewhat on the use to which it is to be put. For cut flowers a house running north of east and south of west, so as to receive first rays of sun in morning, is possibly preferable. For plants a house could run north and south and more of the space could be utilized. In the north-south house narrow supports could be placed near roof and several rows of flats containing plants could easily be handled without interfering to any great extent with the crop underneath, as the line of shade cast by the boxes would be constantly shifting. If benches are used in the house, many plants can be temporarily stored underneath each along the walks, like old stock plants of geraniums, etc., and at some period of the day the sun will reach them, for a short, though welcome stay.

Water is another item that must be considered. If the house is quite small, and help is more plentiful than means, to install a power pumping outfit, a good hand pump connected in such manner that one could pump and another manipulate the hose, would answer, though you would soon look upon this as an arduous occupation. The better course would be a small gasoline engine and a good pump. The tank could either be on the pneumatic storage principle and placed in the basement, or an open tank located in attic of house or barn. The former would be desirable as by that means damage of freezing would be obviated and any desired pressure could be maintained to combat red spider, and you will find red spider one of the worst pests with which you have to contend. It is so small that the plants of the amateur may be badly infested before he is aware of its existence in his place.

When eggplants, tomato, etc. plants begin to turn a light gray color instead of a dark healthy green it is time to inspect the under side of the leaves closely. The chances are you will find a mass of exceedingly small reddish insects, that can only be killed by a contact application or by being dislodged by a strong spray of water. Ivory soap dissolved in hot water, five-cent size to four gallons water, and sprayed *on the insects* will do it, but pure water applied with force is best, as several applications of the soap weakens the constitution of the plants. The soap spray will help hold white fly in check on tomatoes, though on large commercial places hydrocyanic acid gas is used, but is of doubtful recomendation to the amateur on account of the extreme danger connected with its use.

There may be situations where it may appear desirable to construct a lean-to house on the south side of a building already constructed. A structure of this nature would answer fairly well for vegetable plants, though everything grown in it would have a tendency to draw toward the sun. If a house is constructed 16 feet square or even 20 feet square, it could be heated with a large cylinder stove encased at a distance of 12 to 18 inches with a piece of sheet iron as formerly explained in article on transforming a cold frame into a greenhouse. Hot water is the most desirable method of heating, but in a short house is expensive to install on account of the many fittings and work of cutting pipe required, as this expense is no greater for the 100-foot house than one 20 feet long. There are doubtless many who have an exaggerated idea of the profits that may be made from a greenhouse. You can get some idea from following suggestions as to limitations in this respect. During the Winter months we put five and six radishes in a bunch and wholesale at 3½ cents. If you can sell direct five cents is the price. These occupy bench space about six weeks and stand 2x4½ inches in the beds. Grand Rapids lettuce will occupy bench near two months and should net five cents each, planting 6x7 or 8x8, and tomatoes planted in beds February 1 to March 15 should average four to five pounds fruit per plant, plants being set 16x18 inches in beds and fruit should sell at 10 cents per pound and possibly a few cents more if well grown and sold direct. Vegetable plants in this section sell at 10 cents per dozen generally, with eggplant at possibly 15 and cauliflower same price or higher. They should have a space 2x2 inches or better 2x3 inches; even this distance is too close for eggplant. That is gross income, and is greatly increased or decreased by the amount of attention and application given. Labor, coal, water, insecticides, manure, fertilizers, etc., make a fairly formidable array of expense, which as a general thing keeps the net income from becoming burdensome. Many will, however attain so much satisfaction from growing plants out of season, and being with this small area of Summer verdure while the wind is howling outside, that even though the care be constant, and the net returns not over burdensome, they will feel amply repaid, as the love of growing plants and flowers can scarce be gratified during Winter in any other manner.

We will describe a house about 15 to 16 feet wide containing a bed on each side, two walks and a center bed five to six feet wide. The sides can be made



SECTIONAL VIEW OF GREENHOUSE.

either of posts, and boarded up or concrete. We have a house of this size in use that I will describe. The side walls are about 3½ inches thick at top and six inches at bottom, about four feet high, made of concrete, using ashes of bituminous coal just as they come from the shaking grate under the boilers, eight parts, and Portland cement one part, no sand added. This makes a tough job and is possibly warmer than stone as the cinder allows more air spaces in the construction. On the top edge every four feet a half-inch bolt six inches long is embedded, enough projecting to fasten a cypress plate on wall four inches wide and 1¼ inch thick. This plate is given a slight slope outward so as to allow condensation to pass out of the house.

The sash bars are 2½ inches deep by 1⅜ inch thick, and beveled so as to fit snugly to ridge at top and nail flat on plate at eaves, A, see cut. Before nailing on plate the end of bar is painted thoroughly and allowed to dry and then given a coat of thick white lead and oil just previous to nailing down.

In nailing cypress always use *cut finishing* nails. The wire nails split the wood and will rust out long before the wood will rot out. It is best to use cut nails everywhere on exposed work, as they last much longer than the ordinary wire nail. We use a ridge 2x6 inches and a one-inch pipe under same every eight feet, the ridge being four feet six inches above the eaves, which gives a good pitch to the roof. There are two purlines in house to which bars are screwed with pipe straps, one-inch pipe being used for purlines. A brace pipe should run from each purline to the center upright post, and can be fastened thereto by a piece of iron, bent at each end to conform to angle of braces and then be bolted to upright post with an axle slip. This makes a solid and substantial fastening. The same method could be used with wooden posts and siding, and by using posts greater height of sides could be obtained if desired.

Ventilation could also be had by putting a row of narrow sash below eave plate. A row of narrow sash must be placed at ridge of house, and where house is not long, sash can be raised by having a stick hinged under each sash, and holes bored in at intervals of every few inches. In raising sash when desired height is obtained a corresponding hole is slipped over a peg fastened near ridge. There are machines on the market for this purpose.

If the house is much higher at one end than the other it would be best to carry the flow pipes for hot water up hill to far end of house, and give returns same fall to heater, locating heater at low end of house. If the house is level, or nearly so, have high point of system over boiler or heater, and run down hill to far end of house and return same way, being careful to have all pipes perfectly straight in line. By using this method, and locating one air cock at highest point no trouble will be experienced with air in system, and circulation should be very satisfactory.

Assuming a house 16 feet wide by 100 feet long, two-inch pipe would be preferable, and 10 lines would be required, four flows and six returns. If house is only 50 feet long 1¼ inch pipe would be very satisfactory,

Lancaster Co., Pa. ELMER J. WEAVER.

Farm Management.

COST OF AN APPLE ORCHARD TO BEARING AGE.

PART II.

Orchard C is six years of age, having been set in the Spring of 1908. It is an apple orchard 10.22 acres in extent, containing 275 apple trees, varieties Baldwin, Northern Spy and Wealthy, set 36 by 40 feet and filled in the rows both ways with 817 peach trees, mostly Elbertas. The trees thus stand 18 by 20 feet apart.

Cost of growing an apple and peach orchard to four years of age. 27 apple and 80 peach trees per acre set in 1908, 18x20 feet apart:

ITEMS	TOTAL FOR THE 4 YRS. Cost an Acre	Cost a 100 Trees
Labor Cost (man 20c, horse 15c an hr.) setting trees (inc. hauling, staking out, replacing, etc.)	$5.36	$5.00
Spraying (once a year)	.64	.60
Pruning and hauling brnsh	1.21	1.10
Fertilizing and manuring	1.95	1.80
Hoeing and grubbing	2.06	2.00
Plowing (tree rows only)	3.56	3.30
Cultivating	2.87	2.70
Picking (4th year)	.66	.60
Marketing (4th year)	.50	.50
Misc.	.55	.50
Total Labor	$19.36	$18.10
Cash Costs:		
Apple trees, 27 at 15c (inc. replacements)	$4.98	
Peach trees, 80 at 10c (inc. replacements)	10.49	$14.40
Fertilizer	4.14	3.80
Cover crop	3.31	3.10
Spray material	.60	.60
Equipment	2.45	2.30
Taxes	3.95	3.70
Interest (5% on $120 to $175)	29.75	27.80
Buildings (15% crops costs)	2.90	2.70
Overhead (9% other costs)	4.42	4.10
Management	20.00	18.70
Total cash	$86.99	$81.20
Grand total cost	$106.35	$99.30

Summary statement of cost to four years of age.	Acre	100 Trees
Total cost of orchard at 4 yrs.	$106.35	$1.00
Net income from 4 crops, beans between tree rows	53.41	.50
Net income from 1 crop peaches 4th yr.	9.21	.09
Total net income from land in 4 yrs.	62.62	.59
Actual net cost of orchard	$43.73	$0.41
Net income from orchard 5th yr.	46.32	.43
Net income from orchard 6th yr.	53.60	.50
Net gain on orchard in 6 yrs.	59.19	.52
Net gain on orchard per year	9.36	.087

LABOR COSTS.—All labor costs are given in dollars and cents an acre for each operation for the whole 10-year and four-year periods, the ages at which the two orchards came to bearing or at which they reached a point where the annnal income from the trees exceeded the outgo. That this was the eleventh year in the case of Orchard A and the fifth year in the case of Orchard C was due entirely to the original plan and to the management of the two orchards. A brief explanation of some of these labor costs should be made. The item of setting trees includes hauling from the station, staking ont the land and the labor of replacing dead trees as well as the actual setting of the trees. The grafting charges covers the labor of a helper, the actual setting of the scions being paid for at so much per scion and is included in the cash charges. The orchards were sprayed but once a year and in the case of Orchard A, only for the last four years. Pruning was done as necessary, but not systematically every year. No commercial fertilizer has been used except one year in Orchard C. Manure has been applied to the apple trees at least every other year. The peach trees have had no manure. Manure applied to the land between the trees has been charged to the crop. A cover crop of rye, sown in the Fall was sown once in each orchard.

CULTIVATION.—The trees were hoed at least once a year to loosen the surface soil, to form a mnlch and to destroy weeds. The peach trees were "grubbed" for borers in June each year. The orchards were plowed annually, bnt when crops were grown only the plowing of the uncropped land was charged to the trees. The same was true of cultivation which was frequent enough to conserve moistnre and to control weeds. The crops bore all costs of handling the land they occnpied, except when they were grown for the sake of the orchards, as in the case of the rye. In Orchard A, four crops of beans, two crops of corn, two crops of hay, and one crop each of wheat and oats have been grown. Each year the area of crops grown in the orchard was lessened, and the strips of land on either side of the "tree rows," which were cultivated, widened. Four crops of beans were grown in Orchard C. No crop was grown between the trees in this orchard after the fourth year. The charges for picking and marketing all occurred in the last four years in Orchard A, and in the fourth year in C. Miscellaneous costs include banking trees in the Fall, ditching land, etc.

CASH COSTS.—The purchase price of apple trees was 15 and 16 cents each, of plum trees 16 cents and of peach trees 10 cents. The cost of replaced trees has been added to this in the table. The grafting cost five cents for each scion which lived a year. Manure was charged at $1.50 a two-horse wagonload, and spray materials, packages, etc., at current prices. The cost of equipment was arrived at by determining the entire cost of equipment for the farm, which is made np of interest, depreciation and repairs, dividing this by the total nnmber of honrs used to get a rate per hour, and then multiplying the total hours which it was used on the orchard by this rate. The taxes have ranged from .00438 to .009 on a dollar. Interest is charged at five per cent. the enrrent rate on farm mortgages, and has been compounded once a year. Building charges which are composed of interest, depreciation and repairs, have been distributed on the basis of nse by the productive enterprises of the farm. Overhead costs inclnde fence repairs, telephone rents, Grange dnes and similar miscellaneous charges which cannot be assigned directly to any farm enterprise. These have been found to average one year with another about nine per cent. of all other cash costs. The management cost is assumed and nominal. The manager has usually worked 10 honrs at manual labor every day, as well as managing the farm. The owner's management has been confined to working np the orchard records and to occasional visits. He has, however, laid out the plan of management and directed the policy of handling the orchard.

RESULTS.—The results are both poor and good. They are not remarkable in any way, but probably represent fairly well average conditions as they exist in Western New York. Orchard A. is found to have cost $262.13 an acre or $4.16 per tree to grow to 10 years of age. Not counting the plum trees, the apple trees have cost $8 apiece at 10 years of age. Of this total cost, about $52 an acre or 82½ cents a tree is labor, or about 20 per cent. Cultivation is the largest single labor item. Of the cash cost of $210 an acre or $3.33 1-3 per tree, which includes everything except labor, interest amounts to 42 per cent., and management to 24 per cent. These are by far the largest single items, the next in amount being overhead charges which are eight per cent. of the total cash costs and six per cent. of the entire costs. A part of this cost has been offset by growing crops between the tree rows. These have averaged an annual net profit of $4.20 an acre, not counting interest on the land which is charged to the orchard, and have reduced the total cost by one-fifth. The plum fillers have reduced the net cost eight per cent. more and the apples themselves have returned nearly $3 an acre by the tenth year. These factors have reduced the net cost to $200.24 an acre or $3.18 a tree, or to a little more than $6 an apple tree. The crops of apples, plums and canning peas (between the rows) in the eleventh year returned a net sum of $42.51 an acre, or 68 cents a tree of this amount.

M. C. BURRITT.

"PA, a balloon's just landed in the apple orchard." "Good! I'll just run down there and get them to pick the apples off that high tree. I've been wondering how on earth I was going to get that fruit."—Winnipeg Telegram.

THE MASTER KEY TO PERMANENT AGRICULTURE

Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.

DAYBREAK ROCK PHOSPHATE

13% Phosphorus, Ground 95% Through 10,000 Mesh Screen

Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficient in Phosphorus, and the the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to us for delivered prices on *Rock Phosphate*, and state ers who write to us for the first 100 farmers where you saw this ad.

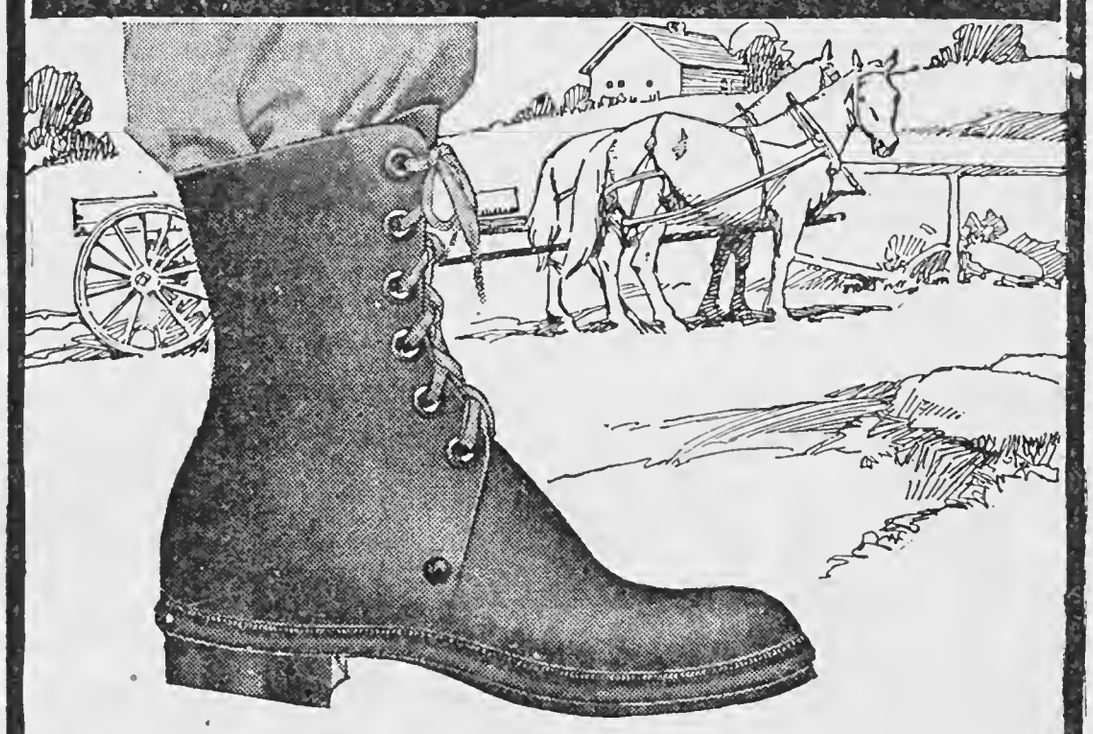
"Better than leather For all kinds of weather"



Why Shrewd Men Are Buying Rubber Work Shoes

The cost of living is up. The price of leather is at top notch. The demand for leather is increasing by leaps and bounds. The automobile manufacturers alone are using it in vast quantities.

That's why leather work shoes are much higher priced than they were in the past. And that is also the reason why rubber footwear—which is better than that made of leather—is being worn by wise farmers.

A pair of **Hub-Mark Bootees,** like the one pictured here, costs no more than leather work shoes, and will last much longer. They are soft and comfortable.

Moreover, they do not chafe nor cause corns, bunions, nor callouses. They are very warm. Try a pair instead of leather shoes.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are squar dealers.

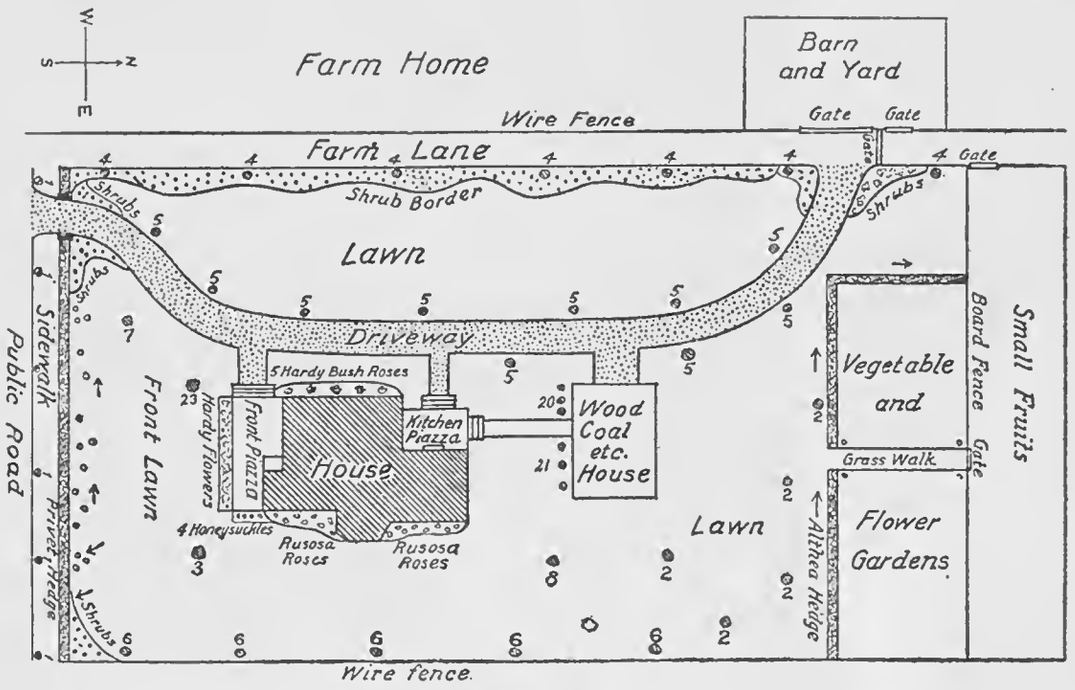
The Home Acre.

BEAUTIFYING THE HOME GROUNDS.

PART III.

There should be no permanent improvements to the home grounds attempted until a suitable working plan of the area to be treated is made, upon which all existing buildings, trees, etc., should be accurately located, and numbered on the plan; also all the desired improvements, including driveway, walks and all new plantings of trees, vines, shrubs and plants should be accurately located on the plan and numbered. In locating the various plantings careful attention should be given to the contour of the grounds, so that all the plantings may be so situated that the most pleasing and harmonious effect may be obtained. In the making of the plans they should be drawn to scale; otherwise it will not be possible accurately to locate the existing structures, nor to locate properly the new things to be added to the grounds. The cut shows a farm-home grounds that have recently undergone remodeling and improvement. The grounds contain about three-fourths of an acre, and are comparatively level. Formerly the driveway ran straight in from the front, past the house, and turned toward the barns at almost an acute angle. The only trees on the grounds were an old Silver maple near the southeast corner of the house, and a few old fruit trees scattered here and there in the rear of the house. A few old lilacs and other shrubs were also on the place, but were all dug up and thrown away.

The front, west and north fences were of post and board construction, without a tree or shrub near them to hide their unsightliness. In the remodeling the front fence has been removed and a privet hedge substituted, along which has been planted at irregular intervals just inside, a number of low-growing shrubs. Silver maples are planted aong the sidewalk in front, and a row of Norway maples along the fence on the west side, and English elms along the east fence. The driveway was changed from a straight line to a graceful curve, entering the grounds near the southwest corner with a reverse curve, leading up to and by the house with an easy curve to the left, and intersecting the farm lane opposite the barnyard gate. Along the drive a number of European lindens are planted, which in a few years will grow into beautiful speciments. Other deciduous trees and evergreens are planted at various points where they will show to the best advantage, and at the same time not obstruct the outlying views from the house.



PLANS FOR FARM GROUNDS.

The front lawn is comparatively unobstructed, so that the view of the house is not obscured from the public road. The west lawn is entirely void of trees except along the driveway and the border along the board fence, which contains the Norway maples and a border of 88 mixed shrubs, in considerable variety, so arranged that the effect is extremely harmonious and pleasing. At the north side of the end of driveway where it intersects with the farm lane is also a bed of choice shrubs. On the east end of the piazza are four honeysuckle vines trained up to the roof of the piazza, and on each side of the bay window are beds of Rugosa roses, each bed containing eight.

In front of the front piazza is a narrow bed planted to low-growing hardy herbaceous flowering plants in variety. On the west side of the house five strong-growing hardy bush roses are planted. The wood and coal house north of the dwelling is screened by six large California privets. The vegetable and flower gardens are in the rear of the grounds, as is also the small fruit garden, which directly adjoins the other gardens on the north, with a board fence separating them. The whole grounds have been so transformed by the improvements as to make it hardly recognizable as the same place, and at a cost for trees, shrubs, vines and plants approximateing about $150 at the nursery. The work of improving was performed by the owner.

Planting specifications of trees for farm home: No. 1, six Silver maple; 4, seven Norway maples; 5, 11 European lindens, 6, five English elms; 7, one Pin oak; 8, Sugar maple; 9, Norway spruce; 10, Douglas spruce; 11, Blue spruce; 12, Retinispora plumosa aurea; 13, Retinispora squarrosa Veitchi; 14, Retinispora filifera; 15, Retinispora plumosa; 16, Retinispora pisifera aurea; 17, Abies Nordmanniana; 18, Retinispora argentea; 19, Abies concolor; 20 and 21 tall privet to screen the wood house; 22, old cherry tree; 23, Colorado Blue spruce; No. 2, old fruit trees; 3, old maple.

CHEMICALS FOR A GARDEN.

Our soils in central Illinois are wanting in phosphorus, and the rock phosphate is hard to get here; at least I know of no firm handling it; I am living in town and only want 100 or 200 pounds a season for my garden. Would ground bone do in place of it? I can get bone meal in Chicago for $2.55 per hundred, dried blood for $3.60, also tankage of two grades. Why not a mixture of them in place of stable manure, which here is very coarse and full of straw and baling wire, which is so nice to sharpen a hoe on? If I could get good wood ashes I would give it a good covering of that. I am in my ninetieth year, and don't like to hoe without growing something.

Tallula, Ill. L. B.

The bone meal will certainly take the place of the phosphate rock. It is much better for garden use. We would use 250 pounds of the bone meal to 100 pounds of dried blood. This would not equal the manure, however, as neither the bone nor the blood contain any potash. This must be supplied in some form. If you can get 600 pounds of good wood ashes, this would go with the quantity of bone and blood we have mentioned. Do not try to mix the ashes with the blood and bone. Scatter the ashes after spading or plowing, and work or harrow in. Use the blood or bone in the hill or drill. If you cannot get the ashes, 100 pounds of muriate of potash can be used with the blood and bone. You are right about the advantages of chemicals over stable manure, so far as filling the ground with weed seeds is concerned. Manure is a nuisance for doing this in a garden.

"DEATH, TAXES AND

The Mapes Manures

Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

The Home Acre.

Rhododendrons on Uncongenial Soil.

Can you tell me whether Rhododendrons and Azaleas (hardy sorts) can be successfully grown on our soil? We are located in the peach belt of Ottawa Co., Ohio, where the soil varies from a yellow clay loam to black loam underlaid with what is here called "blue mud." I have never seen any Rhododendrons either wild or cultivated growing here, and would like to know if a small plot could be treated in such a way as to make the culture of a few specimens possible. I understand that the limestone formation of our soil is not favorable to this class of plants, but I should like to plant a few if there is any way of overcoming this handicap. P. L. V.
Port Clinton, O.

Your soil does not sound at all promising for Rhododendrons, for both limestone and heavy clay are inimical to them. Under such conditions a bed must be specially prepared for them. Dig a place four feet deep; put in one foot of gravel and small stones to provide drainage, which is hindered by the clay subsoil. Fill in with a friable mixture of leaf mold and sandy loam. In the Fall mulch the bed with forest leaves, pine needles or hay. It will be well to leave a light mulch on all Summer, until the plants are large enough to shade the ground. Set the plants firmly, and water thoroughly after planting. Some Winter protection would be advisable, just enough to prevent drying out when bright sunshine is accompanied by low temperature and sweeping winds.

Vines for House and Porch.

I have dwelling house 50 feet long and nine feet to eaves, bungalow style and wish to plant vines to cover it to eaves. Clinging roses are beautiful but must plant other things too, because here in Spring we are quite likely to find them winter-killed. House has shingle sides, three concrete pillars support porch roof. L. C. N.
Winterport, Me.

For a living porch screen, there is nothing more satisfactory than the Japanese honeysuckle (Lonicera Halleana) and Clematis paniculata. Hall's honeysuckle is a native of Japan, as is also the Clematis named. While the honeysuckle is not as showy as the Clematis it is nevertheless an admirable and very useful vine for porch screening, covering fences, trees, etc., and should be in every collection. It is a strong and rapid grower, and perfectly healthy, and might be termed entirely insect proof. Its flowers are pure white when first opening, changing to yellow as they grow older, very free blooming and delightfully fragrant.

Clematis paniculata is considered by many the finest hardy vine in cultivation, and one of the most valuable ever brought from Japan. It blooms in late Summer or early Fall, and completely covers itself with fleecy white sweet-scented flowers in clusters, which are succeeded by myriads of silken seed pods, that are almost as ornamental as the blooms. This grand vine is well worthy of a place on any dwelling, no matter how pretentious or humble it may be. Both these vines will need some kind of support. The two-inch mesh poultry wire netting is admirably suited for the purpose, and for porch screening it may be used continuously or in panel sections as may suit the fancy of the owner of the house.

For covering buildings, walls and dead trees there is nothing among the self-clinging vines quite so well suited as the Boston ivy, Ampelopsis Veitchi. No other climber in cultivation has been so extensively used for this purpose. It is entirely hardy even in the most exposed places, a rapid grower when once well established, and will cover the walls of a building in a very few years, with a mass of overlapping leaves, that is almost impenetrable by the sun or rain. It readily adapts itself to almost any kind of soil or condition. It lends an air of elegance and refinement to any building, and enhances the beauty of the most intricate architectural outlines. No buildings are considered too fine to cover with this vine, while the most unpretentious and unsightly are made picturesque by its use. Set the plants close to the foundation of the buildings, three or four feet apart. K.

Amatite
The Roofing that Needs No Painting

WHEN your roof is covered with Amatite, there is an end to the roof painting nuisance. Amatite has a real mineral surface and needs no painting.

The mineral surface makes painting unnecessary and it will stand rain and hail and wind and snow, for years, without attention.

When you paint the old-fashioned roofings you are practically trying to keep them from getting wet. Amatite is made to get wet, for water won't hurt it a bit. Next time your old-fashioned roofs need painting, cover them with Amatite instead.

A sample of Amatite and booklet about it will be sent on request. Address nearest office.

FUNGUS DISEASES OF STONE FRUITS IN THE MIDDLE WEST.

PART II.

BLACK KNOT.—Black knot is a disease of plum trees and cherry trees. It is scarcely necessary to attempt a description of it, as the dark colored galls on the twigs and smaller branches are so aptly described by the name itself that anyone not familiar with it could nevertheless hardly fail to recognize it at sight. the cut gives a good idea of its appearance. The severest attacks of this fungus are made on the Damson variety of plums, although cherries and other varieties of plums are susceptible to a smaller degree. In some localities, Damson trees have to be cut down after they reach eight or 10 years of age because of the great number of knots which develop on them.

The diseased condition is caused by a fungus, technically known as Plowrightia morbosa, which lives in the cambium, inner bark, and often in the woody part of the stem. The knot usually makes its appearance as a slight swelling in the Spring, and develops gradually until by the end of the Summer, it has the black carbonaceous appearance so characteristic of the disease. During the late Spring and early Summer, the knot may be observed to have a greenish tint. This is

BLACK KNOT ON PLUM.

caused by a velvety outgrowth of fungus threads, which produce spores in abundance. These spores germinate on the twigs when moist and spread the disease. Later in the history of the knots, during the following Winter, to be exact, more spores are produced. These are of a different type from the Summer spores, but are no less capable of infecting the host.

The habit of the fungus, as just described, suggests one means of control. The knots should be trimmed out of the trees and burned, before the spore producing period in the Spring—some time before March—and again in the Fall before the Winter spore production has occurred. When affected wild trees or affected neighbors' trees occur, this may not be sufficient. In such cases, it will be necessary to resort to spraying; and in any case it will be advisable to do so. For this purpose use boiled lime-sulphur diluted to test 5 deg. Beaume, and apply in March to prevent infection by air borne spores.

Right here it seems in order to urge the importance of coöperation in stamping out this disease. There are men in the Middle West who have had to give up the culture of Damson plums because their neighbors made no attempt to control the disease, and they who did make the attempt found it impossible to cope with the condition when new infections were constantly occurring from the outside. A whole neighborhood, or township, or county must work together if success is to be assured.

SCAB.—Scab is a disease of peaches and plums, causing a gray or brown thickened condition of the skin of the fruit. This condition, if severe, is usually accompanied by more or less extensive cracking of the skin and underlying tissues. It is not as troublesome in this section as the other diseases here discussed, but it is very common, and important enough to be amply worthy of preventive precautions. It is not especially destructive to the crop, but does render fruit unsalable or of second or third grade. The organism, Cladosporium carpophilum, which does the damage, is propagated by spores which are produced over the diseased areas. The remedy is self-boiled lime-sulphur every two or three weeks after the foliage appears.

YELLOWS.—Yellows is a disease of peach trees which is not well understood, although it is generally considered not to be caused by any fungus. It is included here because it was long thought to be a fungus trouble and has many points of resemblance to such diseases. It is characterized by a yellowing of the leaves, the growth of many spindling branches, and the early death of the tree. The cause seems to be due to the production of a destructive enzyme in the tissues. The remedy is to cut down and burn all affected plants, burning them, if possible, just where they stood, as the disease is very easily transmitted to other trees.

SPRAYING.—The fungous diseases which we have considered are all alike in that they can be controlled, wholly or in part, by spraying. It seems well, therefore, to summarize this in a suggested scheme of spraying. This, of course, should be varied to suit the special disease conditions which the orchardist has to meet. Spray first in March or earlier with boiled lime-sulphur diluted to 4.5-5 deg. Beaume. For peaches, spray again about 10 days after the petals fall, or at the time the shucks are falling, with arsenate of lead and lime—two pounds of the arsenate and two pounds of lime to every 50 gallons of water. This is for curculio. Make a third spraying four or five weeks after the petals fall, using self-boiled lime-sulphur and arsenate of lead. This should be repeated three or four weeks later, and for late ripening sorts, again four or five weeks before ripening. For plums and cherries, the Summer sprayings should consist of Summer Bordeaux and arsenate of lead, (1) just after the buds burst, (2) just after the petals fall, and (3) three weeks later. C. A. LUDWIG.

Indiana.

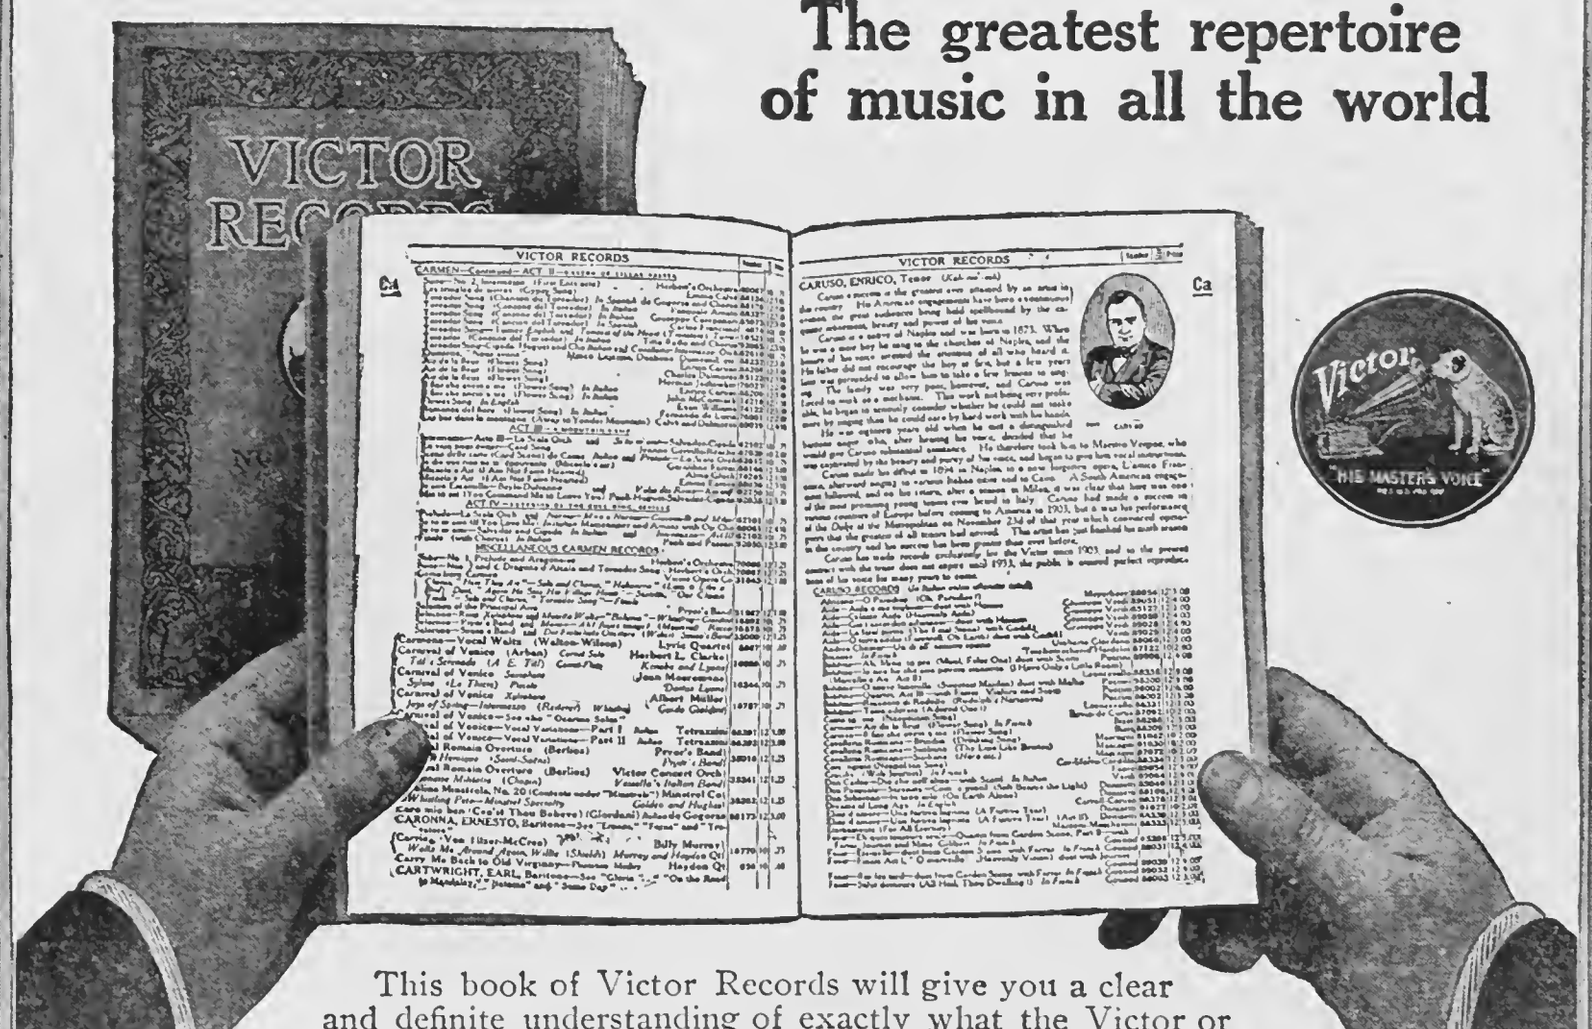
The greatest repertoire of music in all the world



This book of Victor Records will give you a clear and definite understanding of exactly what the Victor or Victrola will bring to you.
It will place before you simply and convincingly the title of very nearly every musical composition you ever heard of. It will help you to an easy familiarity with all the great composers. It will place before you definite and positive knowledge as to the exact music in the repertoire of the world's greatest artists. It will make clear to you just how easily all the music of all the world can become an interesting and helpful part of your everyday life in your own home.
Music is the only universal language. It attracts everyone—the French, the German, the Russian, the Italian, the Englishman are all capable of enjoying exactly the same music. Individual taste however, varies; but with a Victor and its vast repertoire of music, which is the nearest approach to all the music of all the world, every musical longing is satisfied.
This book of Victor Records costs us more than $100,000 every year, but we will gladly give you a copy free. Ask any Victor dealer, or write to us.

Hope Farm Notes

"What does the Hope Farm man think of this conservative father and progressive son discussion?"

I do not know whether I would rank as a "conservative father" or not. What do you mean by "conservative"? Few words have been so abused in promoting a convenient meaning. It has been used to describe one who tries to conserve or save property or rights. At the other extreme, when people want to describe a "skinflint"—a narrow, hard, mean "standpat" character, they call him "conservative" because he has lost the power to grow. Benjamin Disraeli said this about a political party: "A conservative government is an organized hypocrisy." He had it about right, for such a government in a nation or the head of a family may be ranked with a moral dead man—without growth or ideals—standing still in the graveyard of the past, while everything else that is worth while is moving on. I would rather be a "conservative" who saves rather than one who scolds.

As answer to the question I want to give a brief sketch of what seems to me the ideal relations between the two farm characters you name. There has recently been published a book, entitled "From the Letter Files of S. W. Johnson," by his daughter, Elizabeth A. Osborne. In this book, chiefly between the lines, I can read the story of about the finest "conservative father" that an American farm has yet produced. I shall tell more of Prof. S. W. Johnson's work later. He may be called, without question, as Mrs. Osborne says, "one of that small group of great men of genius who are known as 'father of their particular field'." Prof. Johnson was clearly the father of experiment station work in America. He brought from Germany and Europe the knowledge of scientific agriculture, which these foreign nations had been forced to develop, and planted it here at a time when there was little demand or even interest in the subject.

I think it a somewhat unfortunate circumstance that in most histories people are satisfied to rest with the "father" of an event or institution. This does not satisfy me, nor will it satisfy our farmers, and I wish to show that one of their own class, a plain New York farmer, may rightly be considered the grandfather of American agricultural science. Abner A. Johnson may be called one of the original "back-to-the-landers." In 1834 he gave up his business in town and bought farm lands in Lewis County, N. Y. Here he became a farmer. Our "back-to-the-land" friends may claim that his early business training gave him the vision and patience which were later to enable him to play the part of "grandfather."

As a boy Prof. S. W. Johnson was small and delicate, with defective eyes. As his daughter says, these eyes "gave him little information about objects more than a few feet away." This boy read every book he could find. We have all made mental pictures of Abraham Lincoln scouring the country for books and reading them over and over at every spare moment. Here it was again in the case of Prof. Johnson—the reading habit—one of the most blessed things which a country boy can acquire. His daughter tells us that this "indifference to matters outside of books was the despair of his family." This is entirely true to human nature, for who has not seen cases where some child seems to be born with a book in his hand, and with a mind which craves reading as his stomach craves food? I have known cases where such children were whipped or given harder work to "cure" them of the privilege or genius which God sent into the world with them. I have known the books they loved to be hidden, and dull, useless volumes put in their hands to break up the habit, just as the old housewives put aloes and pepper on the child's thumb to break the habit of sucking it.

We may all be thankful that there was nothing of this in the Johnson family. Abner Johnson could not understand the untried land into which this reading and study would lead. A plain farmer, living on the frontier, he could think of only three safe and profitable things for a man to engage in—law, medicine and farming. These three, and the ministry, were all he could comprehend as possibilities in which to find opportunity for education. If farmers of to-day, with all the knowledge of what science has done for farming, take a "conservative" view of education, what must we think of Abner Johnson, at a time when millions of acres of rich new land were so cheap that they could not be given away? With all this in mind we are lost in admiration for the broadmindedness and clear vision which prompted Abner Johnson to have faith in his boy, and to support him in what must have seemed the wildest of "progressive" ideas.

Nor shall the "grandfather" have all the praise, for the "aunt" and the "grandmother" must be remembered. In looking back over his life every self-made man must gratefully remember how mother and sister were true and loyal to him—quicker than the others to see where his ideals led. Prof. Johnson's elder sister saw what he needed, as many another sister has comprehended, and her love and sympathy sustained him. Then there was the invalid mother who helped. In 1848 Abner Johnson gave his boy a building for a farm laboratory and $50 with which to buy chemicals. The mother gave him her wedding spoons, "old and thin and dented by the hard usage of many children." These were to be melted up to be used as chemical reagents for laboratory work. I like to mention these details, because they show the real, vital power of what I may call the true "conservative" family These plain farming people believed in their boy. They knew he was true, and while they could not see into the future as he did, they meant that he should carry with him the best they had to give—not only money, but that greater thing, faith and confidence in him. As you read this you will be able to tell me of a dozen cases where, in farm homes, mother as well as father and the girls have given up the best they had in order that John or Henry might have a chance.

While Abner Johnson provided this laboratory for his own son, he could not believe that chemistry could provide a profitable life work. I imagine he regarded chemistry as a sort of play or mental exercise—not grasping the importance of getting down to fundamental principles. This is probably the chief reason for the differences between most conservative fathers and their educated sons. The older man has made his success through plain common-sense and shrewd observation of surface indication. The boy has been taught to get down under the surface and dig out the fundamental principles. He does not know how to apply them yet, while father does not understand the fundamentals, but does know how to apply such facts as he has learned. The older man's standard of success is profitable *application*, which the boy has not learned. Abner Johnson could not conceive of the profitable application of chemistry to farming, therefore he wanted his boy to become a lawyer or a doctor. That has ever been the trouble about farming—too many men have assumed that one must go into one of the so-called professions, or into manufacturing, in order to find opportunity for the best thought and brain development.

Prof. Johnson became a teacher and finally a chemist at Yale College. The more he studied the more he saw the need of thorough training before he could give his students, and in a larger way his countrymen, what he clearly saw they needed. So he told his father of his desire to go to Europe and spend some years in study with the great chemists in Germany; and the boy asked the father to lend him the needed money. Here was the true, biting test for your "conservative" father. Abner Johnson could not, from his own experience or training, see the need of this expensive European study. How could he realize what the future had in store for agricultural science? Yet, somehow, he had gained through watching his boy something of the young man's faith and enthusiasm. The fact is that Abner Johnson *believed in his own boy.* As the other sons came of age Abner Johnson gave each of them a farm—out of his tract of northern land. He now gave an amount of money equal to the value of such a farm to Samuel. Thus while the other boys received their value in land, Samuel received his share in education! When we consider that Abner Johnson knew the value of *land,* but speculated in education on the sole security of faith in his own boy, you will agree with me that this wise and kindly man may well be called the grandfather of experiment station work.

Later I hope to tell you something of what Prof. Samuel Johnson did with his education—how it spread and developed through American agriculture—like leaven through the lump. What I write to-day is to try to make some of these conservative fathers think kindly of their progressive sons. The boy often wants to do things which seem foolish to the old man. Abner Johnson must have thought the same thing. But he had faith in his boy, and banked on that faith. Have *you* the same faith in your boy? If not, why not? He is your boy, and it may be a sort of reflection upon *you* if you cannot back him up in worthy enterprises. Right in this connection, if you have a chance, read the "Introduction" to Joe Wing's book on "Alfalfa Farming in America." There you have the "conservative father and progressive son" again.

And, by the way, before we leave the subject here is another type of the "conservative father."

The I ope Farm Notes on the subject of "Sleep" prompt me to suggest that there are other causes than insomnia that interfere with sleep. All five of our children have whooping cough, and we find that it not only seriously breaks up the quiet hours of the night, but also disturbs in other ways the customary regime of domestic life. C. L. M.

We know all about this from experience. When the small son is progressing with whooping cough it is a wise father who gets up to conserve his wife's health and sleep. That would have been a good job for my weary friend.

H. W. C.

Winter Vetch Sown in Spring.

If Winter vetch is sown in the Spring, will it make a crop of seed this season? If it will, how would it do to sow oats with it for support? G. B. S.

Keesville, N. Y.

No, you will not be satisfied to sow Winter vetch in the Spring. The Spring veteh will do better, but we think Canada field peas with the oats will give a more satisfactory crop.

Spring Rains

have no terrors for the farmer whose buildings are covered with a good, permanent, substantial roof such as

"Rain-Tight" Rubber Roofing

lasts almost indefinitely, and, counting the length of service, it is the most economical roof you can buy. It is made of Trinidad Lake Asphalt—the standard asphalt of the world. It is the same material that is used to make city pavements, which withstands the constant pounding of horses' hoofs and heavy-laden wagons.

Our brand of "PERFECT ROOFING" is the same as "RAIN-TIGHT" with Mica Flakes added to the surface, which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

PERFECT ROSIN SIZED SHEATHING AND PERFECT TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us to-day.

Ruralisms

Roses; Lilacs; Pecans.

1. How can I get rose cuttings to take root? I have tried many ways but failed every time. 2. I have some single purple lilac about seven years old, good size; look like healthy nice plants, but have never bloomed. I have been told they get eight or 10 years old before they bloom; is this true? 3. We have a pecan tree about seven or eight years old, 12 feet high; it never bears any nuts. How long will it be before it bears? I have heard they will bear when they get about 18 or 20 years old. A. B.
Saltillo, Miss.

1. Southern conditions vary from those of the North, but you could doubtless take cuttings of ripe wood, in the Summer, insert in a well-prepared, half-shaded spot in the open ground, and then cover with a fruit jar, or other glass of sufficient size, leaving undisturbed until the following season. A correspondent in Louisiana writes us that she is very successful there propagating roses in this way, which is also satisfactory here. The surrounding earth may be moistened without raising the covering.

2. We infer that the lilac named is a natural seedling, and one cannot make an accurate guess as to its time of coming into bloom, as this varies with individual plants. We have dug out one lusty seedling that showed no signs of bloom after 10 years' growth; in another case a seedling bloomed the sixth year.

3. Seedling pecans are of very uncertain bearing age. Grafted trees may bear a few nuts three years after planting, but nut growers find it advisable to prevent commercial bearing until the trees are eight or 10 years old. Some varieties are naturally shy or tardy bearers. Without fuller data, it is impossible to say when you may expect a crop from your tree.

Transplanting Hemlock Spruce.

In answer to E. E. S., page 212, you speak of Hemlock spruce for wind-break. What is a hemlock spruce? Last Spring I transplanted 30 York State hemlocks along the highway in front of my house for wind-break as well as improving the looks of the place. The sets were taken from the woods on my farm, from very thick groves, of which I have a large number, as they need to be thinned out. The sets run from six feet to 16 feet high. The soil from which they were taken is sandy, and they were reset in sand with the leaf mold from which they were taken placed around each tree. All set the last of April to the last of May began to die and continued to die until the first week in July, when there were five of the largest and tallest left and looking good, and while writing this I am looking out of the window at these trees with their nice green tops and they look good to me. The second week in July I transplanted five more when in full flower; these are now looking as though they would live. Can you give me any information in regard to the transplanting of our native hemlock, as I suppose there is a difference between them and the hemlock spruce.?
Schuylerville, N. Y. D. W. T.

The hemlock spruce, Tsuga Canadensis of the botanists, is of course the "York State hemlock" you refer to. The term "hemlock spruce" is preferred to hemlock alone, because the name hemlock also belongs to the highly poisonous Conium (spotted parsley, herb bennet or wode-whistle) which was used by the Greeks to execute obnoxious persons. The hemlock spruce is not difficult to transplant, but specimens six to 16 feet high would require more care than smaller ones, although much larger trees than these are moved with success under nursery conditions. It is evident that you did the work carefully, but where digging trees from the woods you would have better results if they were not over three feet high. The end of April was rather early, too, especially if followed by cold windy weather; conifers are usually transplanted later than deciduous trees. The most important thing is care of the roots, which should never be allowed to dry out. It is well to puddle them in wet earth as soon as dug, and keep them thus protected until they are in the ground again. In replacing the dead trees, try planting a little later than the first lot, preferably in May, select rather smaller specimens, and protect the roots when dug. You cannot have a more desirable wind-break than this beautiful native tree.

HAMILTON-MADE
SPRAYING HOSE

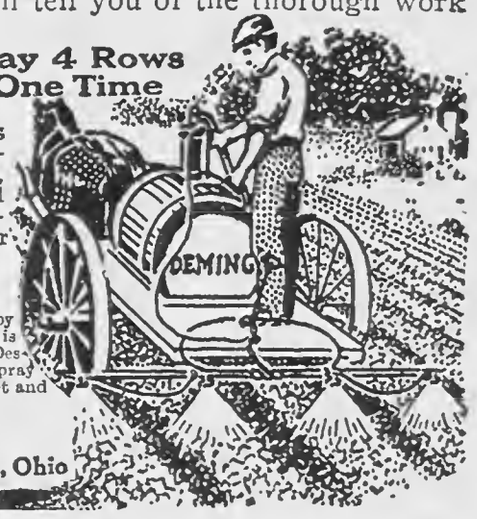
and **"Electro" Arsenate of Lead Powder** (33%) which, used wet or dry, has no equal in strength or texture. Avoid imitations. **B. G. PRATT CO., Dept. N 50 Church Street, New York City.**

Double your Potato Crop.
Sprayed potatoes yielded an average gain of 66 bu. per acre or 50% more than unsprayed potatoes. Experiments carried on for 20 years proved that. Let us send you pamphlet giving details about these experiments. It proves our statement and our catalog will tell you of the thorough work done with
Deming Spray Pumps
Spray 4 Rows At One Time



The Deming Field Sprayer, shown alongside, is the handiest thing ever devised for spraying potatoes, strawberry beds, small nursery stock, cotton fields, etc. Easily and quickly attached to any wagon, sprays four rows at one time. Nozzle holders are adjustable. Ask your dealer or write us if he cannot supply you.
Spraying Guide and Catalog FREE
Don't pay tribute to bugs and blight, but fight these foes by Spraying. How to spray and when to spray is told in our unique sprayer catalog and guide. Describes complete line of Deming Sprayers. Write for potato booklet and spraying guide To-Day.

Blast Tree Holes; Get Better Roots
To grow fast and bear early, trees must have vigorous roots. "Both apple and peach trees planted in blasted holes developed deeper and stronger root systems than those in spade-dug holes," the N. J. Experiment Station found. "Soil around spade-dug trees was hard; around blasted trees it was loose for yards." Plant your fruit trees in holes made with
Atlas Farm Powder
THE SAFEST EXPLOSIVE
and they will grow faster and bear earlier than spade-set trees. Just punch a hole, charge it, light a fuse and the work is *done!* Be careful to get Atlas Farm Powder, made especially for agricultural use, and sold by dealers near you.
Atlas is the easy, quick and economical explosive for use in planting trees, blasting stumps, digging ditches, and doing many other kinds of farm work. Use it to break up the subsoil in your fields and get bigger crops.
Send Coupon for Valuable Book—FREE
Our new illustrated book, "Better Farming," shows how to save money and increase the productiveness of your farm by using Atlas Farm Powder. Sent free—mail the coupon and get it now.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

DID you feel the recent earthquake? Can you give any actual facts about it? If so a government official wants to hear from you. Charles Otis Smith of the Geological Survey, Washington, D. C., is after all posible data regarding this "quake." If you have any real information to report Mr. Smith will gladly hear from you.

*

AMONG famous old yew trees in the British Isles is one in Gresford Churchyard, North Wales, which is supposed to be 1,500 years old. The bole at the ground is 23 feet in circumference; five feet up it is 31 feet; height 60 feet, and spread of branches about 660 yards. The trunk has increased nine inches in the past 50 years.

*

HERE is a strange thing. Not long ago we printed an article, and in due time there came two letters about it. One man said: "That is *punk*. I have never been able to raise that crop; therefore I know it can't be done." The other man said: "It is exactly right, as I know by experience." We find a number of people who seem to measure the possibilities of a thing by their own performance. There may be a big difference between the two, but it is hard to realize it.

*

I LIKE your paper, but sometimes I read therein things that are contrary to my experience and which do not seem practical. M. E. K.

Perhaps that is one chief reason why you like the paper, for the quality you mention is one of human nature. We recognize the fact that life has many angles, and experience many sides. No man can view them all. Our people try to give us what they see from their standpoint. You or someone else see it from another side and find it different. We try to get our people to believe that this difference is not a thing to fight about, but a chance to learn wider experience.

*

THE dog who once begins at sucking eggs will keep it up as long as he has legs. Likewise the cat who gets a taste of chicken will hunt for prey until she comes to sicken. Yet these dumb brutes who chase their nature through are not so bad as that mean, hateful crew of fakes and grafters who would rather live on "other people's money" than to give clean, honest service for their daily bread. They can't reform; the poison in their head and in their heart makes them a gilt-edged thief. Like dog or cat, look only for relief to honest printer's ink and steel-barred jail. Put them behind the bars, give them no bail.

*

BOTH sides of the dog question are up again. No use trying to bring the extreme dog haters and the dog lovers into any "brotherhood," for they do not care to be brothers. The great majority of us recognize a good dog when we see one, and have no wish to exterminate all dogs. At the same time we recognize the damage done by curs and homeless mongrels. These constitute a genuine "dog curse." That does not mean that all dogs should be destroyed, for the men behind these curs are more responsible than the dogs which each year kill over 600,000 sheep. That Maine dog law, analyzed on page 420, seems to be satisfactory—the only one we have known which can be said to be.

THERE has not been so much about free seeds in the papers this season, but none the less the subject has not been forgotten. Secretary Houston is opposed to this free seed humbug; but what can he do, while Congress is dominated by five-cent men who think farmers can be bought by a paper of seeds? He may not do much, but you can do more, because your Congressman has a vote on this silly graft. Mr. Charles F. Crane, of Clear Lake, Iowa, has a very clear view of this subject, and he shows us all what to do. He received a package of these free seeds from his Congressman, G. H. Haugen. Mr. Crane did not waste time or words in settling the free seed question. Here is an extract from his letter to Mr. Haugen:

We consigned this package to the waste paper basket, where previous consignments have gone. We are short of waste basket room and do not care to have this space encumbered with more of such trash. The first two years we received your seed we planted it, but found it so inferior to the varieties that we could buy at the store (undoubtedly not suitable for this climate), two packages for five cents, that we have discontinued the use of it.

It is nauseating to us to see the government spending millions of good dollars for a worthless article, and is surely disgusting to see a Member of Congress trying to perpetuate himself in office by handing out such worthless sops to his constituents. A match or a toothpick might contain some real value, wouldn't cost the government as much, and we have no doubt would be used by a majority of the recipients where not one-tenth of the seeds ever get into the ground, and when they do are a detriment to the planter.

Mr. Crane hopes that some day we may have a Congress that will not go to seed. Not until the real owners of Congress clean it up and make it work. Who are the owners? What these Congressmen call "*the common people!*" "We, us, and our neighbors."

*

"*Which may be harmful to health.*"

These six words are responsible for the deadly thrust which the Supreme Court has given the pure food law. This phrase is "not as wide as a church door—but it is enough."

The Supreme Court held that this "joker" in the law makes it necessary for the Government to prove in each case that there is enough of the poison present in the food to produce actual harm. Under this ruling a manufacturer is apparently left free to use poisons up to a point where a jury will decide that there is enough to be "harmful." Children or invalids or persons peculiarly susceptible to a certain poison, might, under this ruling, be killed by the hundred until some jury decided that the food ought not to injure a strong man. Also consider how hard it will be for the Government to prove such cases. The poisoners can employ the greatest scientific "authorities" in the country to confuse the issue and raise doubts in the minds of the jury. Men from the great universities are for sale in an effort to break down the pure food laws while this phrase of six words remains as a loophole. These eminent scientific gentlemen will not relish the suggestion that their opinions are for sale. Let them tell what they call it. We waste no time criticising them or the Supreme Court. The direct thing to do is to take these words right out of the law and thus prevent the use of poisonous substances in food. Congress can do that—no other power is capable of it. Let us therefore get right after Congress *until that poisonous knothole is plugged up.*

*

THE U. S. Department of Agriculture makes this statement:

The unscrupulous seedsmen are now reaping large profits in supplying the demand for acclimatized and improved varieties of seed with substituted seed, which are in many cases unsuitable to the local growing conditions, and which cost as a rule much less. It is difficult even for a seed expert to determine the origin or purity of type of these seeds, especially if it is well cleaned, so that at the present time practically all the surety of protection the farmer has against misrepresentation is the word or reputation of the dealer of whom he is buying his seed.

This charge does not include all seedsmen, for there are many honorable dealers who would never adulterate their seed. It refers to the frauds who rank with the grocer who put sand in brown sugar and plaster into flour, or beef fat into "butter." The fraud is done in inducing farmers to pay a high price for "improved" Alfalfa seed and then delivering an inferior grade. The scheme is to advestise during the season for "Grimm," "Montana," or other superior strains. This leads people to think that such frauds have the seed for sale. What they really do is to mix in with the small amount of superior seed a large amount of inferior stuff and sell it all at the higher price. In this way these smart mixers can make a profit of from $1,000 to $3,000 on a carload of imported seed. This is even worse than mixing lard or suet and cotton oil and selling it as pure butter. The end of the "oleo" comes when you eat it, but the damage of the Alfalfa fraud may go on for years. The Department calls for a Federal law to stop this work. This might be an amendment to the pure food bill guaranteeing protection to the farmer in interstate commerce. It would mean sampling and inspection, publicity and heavy penalty. Such a law would be just and fair. We think the Government might well mix up with the mixers.

*

CAN we fight Jack Frost with artificial heaters? More than 50 Eastern fruit growers ask that question. They have heard of successful frost fighting in the West. Can we do it here? Next week we shall print an article giving actual experience in a Western apple orchard. Later there will be further notes on frost fighting in gardens and small fruit plantations. The theory of this fight is that small and smoky fires, 50 or more to the acre, kept constantly burning while the temperature is low, will hold warm air and a thick smudge around the trees or plants until danger is past. Oil-burning pots which give a steady blaze and a thick smoke are mostly used. The best results are obtained in protected pockets of land where the cold air rolls down hill, and where the wind is light. In the face of a strong wind the oil pots are not satisfactory. Many growers now plant wind-breaks for the purpose of breaking these high winds and thus giving the oil pots a chance to warm up the air in the orchards. Most of the success with oil heaters thus far has been in the West, largely in small valleys which are naturally cold. Not much of this work has thus far been done in the East, but our experiment stations should take it up and test the plan thoroughly.

*

COULD you give me any information on the following question, or direct me where to get it? How does the intelligence of the country people compare with that of the city? G. S. S.
Vermont.

We find that this year as never before topics relating to farm subjects are being selected by debating societies. The above named subject was, we understand, debated between students of a good country school and a town high school. The classes at an agricultural college recently debated the back-to-the-land question. This movement to discuss publicly these questions of farm life is a good one. Such subjects are far more desirable than the old, worn-out things which have nothing to do with farming or farm life. Nothing can be better than to have young people open these subjects and analyze them fearlessly and to the bottom.

As to the question regarding "intelligence," we would from choice argue for the country side. Intelligence is "the faculty of understanding." The town or city people live within gunshot of great libraries and all means of acquiring knowledge. Yet the greater number of them rarely look into a solid book or do anything that may be called real thinking. We told one of them once about a canning plant, and he wanted to buy seeds of it. Another was sure that potatoes grow on trees. When the price of beef went up several city men that we know said farmers were fools because they did not at once raise cattle and have them ready to sell while beef was high. These men seemed to think that a steer grows to full weight in about 100 days. The average city man seems to believe that the high cost of living is entirely due to farmers, who are all getting rich through holding up the public. The best reading and thinking and the broadest and most charitable and hopeful views of life are to be found in the better class of country homes.

BREVITIES.

MANY a hen has been doctored for all sorts of ailments when the real trouble with her was vermin.

THE tractors are showing us the value of deep plowing. Good judgment is required in this, but without turning up too much subsoil we should go as deep as the strength of the team will permit.

"WELL, the 12 cords of wood are cut and at the door with a few cords sold, icehouse filled and now we must prepare for the Spring and Summer campaign. That is the way a Maine man puts it, and his condition is hard to beat for February.

PINE needles will not make good manure as they come from the woods. They contain too much acid, and should be soaked with stable liquids or mixed in horse manure before using. In their raw state such "needles" will sew up the plant food in the soil.

WE have never known a season with so many reports of poor grass stand and bare spots in meadows. Drought, white grubs and freezing seem to have damaged the meadows severely. Many readers ask if they cannot scatter grass and clover seed over these meadows, and expect in this way to cover the bare spots and obtain a good stand of grass. The chances are against it. We have never been able in our own experience to reseed in this way with any satisfaction. By scattering the grass thickly and scratching over with a light harrow or weeder when the conditions are right, it may be possible to thicken up the stand somewhat, but breaking the land and reseeding is the only sure way to recover the meadow.

AGRICULTURAL CREDITS IN NEW YORK.

On March 2 Governor Martin H. Glynn of New York sent a very strong message on agricultural credits to the New York Legislature. Governor Glynn's arguments are unanswerable, and the Legislature can have no reason for refusing promptly to pass the two bills which have been introduced. These measures are in no way political, but it happens that all three of the large political parties have demanded this legislation. In their National conventions the Republican, the Democratic and the Progressive parties all called for an improved system of agricultural credits. In New York State the Democrats and the Progressives definitely urged a better system on such credit for New York, while the Republicans stood for a general improvement. This is evidence that all the people through their political parties desire such legislation. Governor Glynn proposes to save the farmers of New York millions of dollars by a scheme for converting the present mortgages into what are known as amortization loans. Under this form of loan the debt is paid back in installments on the principle employed by the building and loan associations. This means that each year, or every six months, as desired, the interest and a certain portion of the principal are grouped in one payment, so that at the end of a certain time the entire debt with its interest is wiped out. For example, on a loan for $1,000 at 6 per cent. for 10 years, an American farmer pays each year $60, or $600 for the 10 years. He still owes the original $1,000. This means that should he ever pay the mortgage at the end of 10 years, it will have cost him $1,600 all told.

If this farmer could avail himself of the European system, he would pay each year $135.86, or during the 10 years $1,358.60, and would have his debt paid, both principal and interest. Thus he would save $241.32 over our present system, and the farm would belong to him. Governor Glynn states that the mortgage indebtedness of New York farmers is $100,000,000. A system of agricultural credits which would change our present form of mortgages into amortization loans for 10 years will save our New York farmers $24,000,000. If they could be changed into 50-year amortization loans the total saving on these New York mortgages would be $82,000,000. Governor Glynn shows what this form of loan has done for France, Germany and Ireland. It has encouraged many a man to obtain a piece of land, which he otherwise could not buy. It has also enabled many a farmer to obtain the needed capital with which to operate his farm, and has turned thousands of tenant farmers into freeholders, giving the man the right to call a piece of land his own. As Governor Glynn says, with great force:

"The way to make a people collectively the masters of the world is to make them individually masters of a few feet of earth."

To bring about this result Governor Glynn proposes two plans, which will work together in harmony. One is the establishment of a large central bank issuing debentures, to be secured by mortgages placed by saving and loan associations acting as feeders for the central bank.

In this system existing associations together with savings and loan associations to be organized among farmers would be stockholders in the central bank. The members of these associations would be allowed the privilege of borrowing money on the long time amortization plan.

The other plan authorizes the formation of land banks as stock institutions by the subscription of private capital. This system is advocated by many leading agriculturists and financial experts who have devoted much time to the study of agricultural credit abroad and to our need for it at home.

The two bills have already been introduced in the Legislature. We shall analyze them fully, and give a thorough explanation. This is the most important financial legislation that has yet been attempted for the farmers in New York State. Made into law these suggestions will have a far-reaching effect upon New York agriculture, and every farmer, not only those who are in need of capital, but those who are well provided with it as well, should work together to have these bills promptly passed and made into laws.

FAKE FIRE IMPROVERS.

I inclose an advertisement. I bought a small package of the stuff, and inclose you a sample. The directions say: Dissolve a heaping teaspoonful in one-half pint of water, and sprinkle over one hod of coal. I can't make the stuff dissolve. What do you know about it? C. W. C.

Boston, Mass.

The advertisement offered "Leskole," which is said to save one-third to one-half coal and money.

"Stop Burning Up Money."

It is claimed that the stuff will eliminate *all waste,* beside doing other wonderful things. We had the sample analyzed—with the following report:

"The substance which you send is common salt covered with a coating of carbon of some kind, apparently wood charcoal. When placed in water the salt does dissolve, and the carbon remains insoluble, of course, making it appear not to have dissolved at all. If you will place a small amount in the palm of the hand and rub it back and forth with your finger, the black will all rub off, leaving the white cubic crystals of sodium chloride. Taste this white stuff and you will recognize the flavor. These white crystals will dissolve in water readily. The analysis was made by an expert chemist, and you can rest assured it is correct.

"There is something to be said in favor of the various fakes which have been and are fooling the market at the present time. None of them will save coal, although there are substances which mixed with coal would give more complete combustion. These materials, however, are more expensive than coal, so cannot be used with economy. The value in the substances which are sold lies entirely in the directions accompanying the package. These directions alone are worth as much as the directions and the substance put together. They always say, "Use less coal," and that advice is good for there is no doubt whatever but that poor regulation of drafts and poor stoking result in a consumption of fuel in most households, at least twice as great as is needed. With the use of this particular substance which you say is labelled "Leskole," the effect would be to put out the fire rather than to make it burn up, if any effect whatever was observed." R. P. C.

Amendments to the Commission Men's Law.

A bill has been introduced in the New York Legislature amending the agricultural law in relation to the sale of farm produce on commission. The present law, enacted by the last Legislature, compels commission men to obtain a license and to give a bond of $3,000 in order to carry on the commission business. One year's operation of the law has shown the need of strengthening it in various ways. This year's amendments are designed to cover what was shown to be the weakness of the law as passed last year. The present law states that no person, firm, exchange, association or corporation shall receive, sell or offer for sale on commission within this State any kind of farm produce without a license. The amendment takes out the word "receive" and substitutes "or receive for sale," which it is thought will cover a point brought out by this last year's experience. The bond remains the same in amount. The present bill states that its aim is to secure an honest accounting. The amendment adds the words "and payment to the consignor for goods consigned to such person for sale." The amendment also adds the words "due and owing such consignor" in the place of "or received and not honestly accounted for" in the present bill. In the amendment, also, the power of the Commissioner of Agriculture is enlarged. The power to investigate is given to the Commissioner of Agriculture and also to his deputy, counsel or other person duly designated by the Commissioner. The old bill gave the investigator the power to examine the accounts of the commission man at his place of business. Evidently some of the commission men got around that by having so-called accounts kept by outsiders. In order to cover this the amendment adds that "such investigation or examination may be made not only at the place of business of the commission men "or any other person believed to be engaged in the solicitation, receipt for sale or attempt at sale of farm produce on a commission basis." Under the present law, when a shipper wishes to file a complaint, he is obliged to have it certified. The amendment changes that to "verified." Under the present law the Commissioner is given certain powers in granting and revoking licenses. It was found that this gave the Commissioner a narrow latitude in handling several classes of commission dealers. The amendment, therefore, adds the following to his powers in this regard:

"Where the applicant or commission merchant has been adjudicated a bankrupt.

"Where the applicant or commission merchant is insolvent.

"Where there has been a continued course of dealing of such nature as to satisfy the Commissioner of the inability of the applicant or licensee properly to conduct the business of commission merchant or of an intent to deceive or defraud shippers.

"Where the licensee has been guilty of fraud or deception in obtaining his license.

"Where the licensee neglects or refuses to file a bond with additional or other sureties upon due notice being given him to do so by the Commissioner of Agriculture when the financial responsibility of the sureties upon the bond filed pursuant to Section 284 of this Chapter is impaired or doubtful."

One trouble with the present law is the fact that the commission merchant is not required to keep complete records of his sale, and there has been no way of investigating a number of cases which were brought before the Commissioner. The amendment to the law seeks to overcome this trouble by compelling the commission man to keep the following records of sales: He is required to keep the date of sale and the name and address of the person to whom he sold the goods. This will be the keynote of the whole proposition. Instead of keeping the *selling* price as the present law requires, this amendment demands that he keep a record of the price which he receives, and, of course, the name and address of the buyer, and he is required to preserve this record for the period of one year, and a copy of it shall be mailed to the shipper together with payment in settlement within 48 hours, unless otherwise agreed. The amendment also makes it an offense for any person, firm or exchange not only to receive, sell, or offer for sale on commission farm produce without a license, but also definitely classes, the dealer who advertises or holds himself out to sell on commission. These amendments, if they pass the Legislature and are signed by the Governor, will strengthen the present law. They are just and fair, and what we need. Every farmer and shipper in the State should at once get after his Assemblyman and Senator and tell them in no uncertain words that he expects them to vote for these amendments. Do it at once.

New York State News.

ROAD REFORMS PROPOSED.—The Assembly graft committee it is expected will ask the Legislature to prohibit highway contractors from making campaign contributions, put all highway department employees under civil service and make supplementary agreements in highway contracts impossible except on approval of the State Comptroller. If such recommendations are adopted they will go far toward solving the graft problem as affecting the highways. An interesting fact came out in the testimony before this committee the other day. It is interesting only as showing to what lengths some contractors went in gouging the State. It was stated that asphalt was sold to the State in uncleaned molasses barrels, and in vinegar and whiskey barrels, which often contained sugar, burlap, bolts, nuts and other rubbish, all of which was thrown into the melting pot and charged up to the State at clear asphalt prices. This company had contracts for highway work in Herkimer County, one of which was obtained by paying $2,500 to another construction company. The 6.84 miles of road cost the State $74,000.

FINE FRUIT, LOTS OF IT.—It is stated that a carload of Greenings was shipped from Williamson, Wayne County, a short time ago which topped the market at $7 per barrel. It appears that not all the fine fruit comes from the Hood River valley. The total shipments from Sodus, same county, the past year were 3,000 carloads, this including fruit, produce, etc. Cold storage fruit is bringing high prices now.

PEACH BUDS FROZEN.—One thing is certain, the peach growers of Western New York will not have to thin their peaches this season. They will be thin enough even if there are any at all. Prof. King and Mr. Seth Bush are authority for the statement that the crop has been badly injured by zero weather, and both agree that from 75 to 90 per cent. of the buds have not survived the freeze. Some believe that the late warm Fall has had something to do with the trouble as the wood did not ripen so that the buds could better withstand the extreme cold. While the peach crop has not failed, it is said, in thirty years not more than once, it is this fact th t still gives some encouragement to peach growers.

CONDEMNED MILK SOLD AGAIN.—The astonishing fact was brought out at the hearing of the milk commission in New York last week that milk that had been condemned by the city authorities because typhoid fever had been traced to it, had been reshipped up-State and sold, sometimes to butter and cheese factories. This statement was made, if he is correctly reported, by Dr. M. B. McMillan, of the City Health Board.

GIVING AWAY COLORING FOR OLEO.—On March 3 the Court of Appeals handed down a decision sustaining the right of the State to prohibit the selling or giving away any coloring matter with the sale of oleomargarine. An appeal had been made from a lower court by Peter H. Van Kampen, a grocer of Brooklyn, which court had awarded the State a penalty of $100 against him. He was charged with giving a customer some coloring matter with the sale of a pound of oleo. It was claimed that the giving of a customer such coloring matter at the time of the purchase of the oleo was really an inducement, or at least a suggestion to him, to so color it, or in other words it was an invitation to him to violate the law. All judges of the court concurred in the opinion, which was written by Judge J. W. Hogan.

DUTCHESS FARM BUREAU.—At the monthly meeting of the Dutchess County Farm Bureau, held the last day of February, it was decided to formulate a plan for co-operative buying and selling, and a committee was named to carry out the plan. A gift of $400 was reported for the work of the bureau from a resident of the county whose name was not given. Prof. Wilkinson of Cornell will be in the county from March 9 to 12, and will take up any problems the farmers have to suggest to him and help them to solve them. The Bureau now has 162 members.

CO-OPERATIVE MARKET ASSOCIATION.—There has been organized at Unadilla the first farmers' market association in the State, under the recommendation of Governor Glynn. It is framed along the lines of a corporate company, with shares at $100 each. Samuel L. Halbert has been appointed as sales agent. The officers of the association are: C. O. Potter, president; S. A. Fisher, secretary; Arthur Rowell, treasurer. The territory covered by the association takes in parts of Otsego, Delaware and Chenango counties.

DAIRYMAN'S LEAGUE.—President Gerow of the Dairyman's League says that while agreements are coming in very satisfactorily they yet lacked, the last week in February, about 60,000 cows. There are at present 11,000 stockholders, with 315 branches in the five S... Last September a resolution was adopted by the Board of Directors that if the League received the endorsement of 75 per cent. of the stockholders by February 1, the League would ask for recognition in making the price of milk.

AWARDS FOR CATTLE KILLED.—Senator Godfrey's bill asking the State to pay interest on money due to farmers and others owning diseased cattle which were condemned and killed by the State, has passed the Senate. It was almost unanimous, the vote being 40 to 1, Senator Carswell of Brooklyn being the one.

WEEDING OUT POOR COWS.—The Onondaga Farm Bureau is making a determined effort to weed out unprofitable cows from the herds in that county. Last year about 1,000 cows were placed under test, and it is planned to add 2,500 more cows to the list this year.

OTHER BILLS.—A bill introduced in the Assembly would amend the labor law to exempt employees in dairies, creameries, milk shipping stations, butter and cheese factories, etc. The bill relating to trespassing by hunters and fishermen, and forbidding them to let down bars, open gates or fences upon the lands of another, is also before the Assembly, and still another refers to several appropriations for the School of Agriculture at Morrisville. J. W. D.

THE Department of Agriculture has analyzed what is called "egg powder" or "egg substitute," which is said to have all the effect of eggs in baking. This libel on the hen is nothing but baking powder, filled up with ground rice, and colored yellow with powdered turmeric. That's a clear libel on the hen. Even the Hope Farm man's scrubs would be ashamed to lay baking powder and rice, even though that were counted to help out their record.

Woman and the Home

From Day to Day

REST.

I lay me down to sleep,
With little care
Whether the waking find
Me here or there.

A bowing, burdened head,
That only asks to rest,
Unquestioning, upon
A loving breast.

My good right hand forgets
Its cunning now;
To march the weary march
I know not how.

I am not eager, bold,
Nor strong—all that is past;
I am ready not to do,
At last, at last.

My half-day's work is done,
And this is all my part;
I give a patient God
My patient heart.

And grasp His banner still,
Though all the blue be dim;
These stripes, as well as stars,
Lead after Him.

—Author Unknown.

*

ONE of our readers on the Pacific coast wrote us that violets and Crocuses were in bloom, just at the time another reader wrote us of the fields of ice surrounding her island home in one of the Great Lakes. From our office windows at that time THE RURAL NEW-YORKER looked out on mountains of snow, awaiting the pleasure of New York's Street Cleaning Department, and those Oregon violets, and the bluebirds who were there setting up housekeeping, seemed many months, as well as many miles away. Indeed, with our readers so widely scattered, not only in this country, but also abroad, "seasonable" advice has to be scattered all over the year, for the housekeeper in one district may be canning berries when her distant sister is looking forward to the first dish of rhubarb.

*

WE think our recipe for corn chowder is extra good. Cut four slices of bacon into dice, and fry brown; remove from frying pan, put into a deep kettle, and put into the fat a small onion, or piece of one, about the size of a walnut, shredded fine. Brown the onion, then add that and the remaining fat to the bacon in the kettle. Then add one pint of potato, peeled and cut into dice, pepper and salt to taste, and one quart of boiling water. A stalk of celery, chopped, or some green pepper shredded may be added if available. Let the chowder simmer for two to three hours, stirring frequently, so that it does not stick or burn. About an hour before serving add one can of corn; when it comes to a boil add one cup of hot milk, four crackers rolled fine, and a piece of butter the size of a walnut. Let it come to a boil again and serve very hot.

*

MISS Julia C. Lathrop, Chief of the Federal Children's Bureau, in her first annual report, refers again to the lack of a general system of birth registration in the United States, which hampers the collection of statistics regarding infant mortality. She estimates, however, that last year 300,000 babies died in the United States under one year old. Of these 42 per cent. died before they reached the age of one month and seven-tenths of this 42 per cent. died from the result of prenatal conditions, or of injury or accident at birth. That means that a great proportion of these hapless infants are martyrs to preventable conditions. Setting aside all questions of personal feeling, of pain and sorrow, what an economic waste is here involved! No plan for conserving National resources can be considered complete without a fuller effort to amend the conditions responsible for this appalling loss of human life.

*

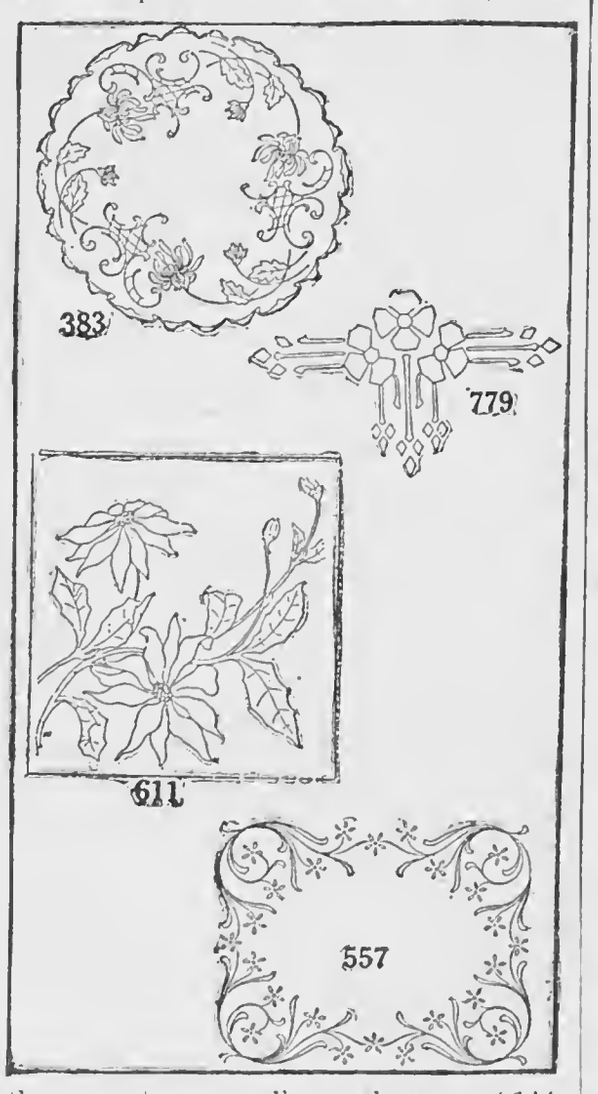
WHEN struggling with the minor miseries of chapped hands and cracked finger nails, which usually accompany a severe cold spell, it must be remembered that all constitutions are not alike, and a remedy that suits one will not help another. Many find vaseline entirely useless, if not actually detrimental; others get no alleviation from cold cream. Glycerine is often useless unless mixed with rose water, but we find the mixture very helpful; the glycerine alone is often very irritating. Clarified mutton tallow is really very useful; if a little almond oil is beaten into it while it is still warm it does not become so hard, and is very soothing to the skin. It is also comforting to rub the hands with almond or olive oil before washing them with soap and water; this seems to soothe the inflamed surface, and prevent further chapping. An old-fashioned ointment, very soothing to chapped hands, used to be made with elder flowers. Hard mutton tallow was clarified by melting in water, then skimming off when cold. This was

then melted in an earthen vessel stood in a saucepan of water, and a qunatity of elder blossoms, free from stems, added to the hot fat. They were steeped for about 12 hours, the vessel being left on the back of the stove, after which the flowers were strained out and the ointment poured into small jars. Some added a little almond oil, beaten in while the ointment was warm. It had a pleasant faint fragrance, and was soothing to sore or inflamed skin.

The Rural Patterns.

When ordering patterns always give number of patterns and measurements desired.

8171 Girl's French blouse dress, 8 to 14. Adapted to bordered material, with



three-quarter or elbow sleeves. 8144 Child's French blouse dress, 4 to 8 years. With skirt consisting of two circular flounces, with short or long sleeves. 8136 Girl's dress, 10 to 14 years. With two-piece skirt, tunic and blouse having straight edges, square or high neck, elbow or three-quarter sleeves. 8167 boy's box coat or reefer, 4 to 8 years. 8149 Child's coat, 4 to 8 years. With back and sleeves in one, Raglan effect at front. Price of each pattern 10 cents.

No. 383 is a center piece, measuring 22x22 inches, in chrysanthemum design. Stamped on best round thread linen, 36 inches in diameter, one dozen of 12-yard skeins mercerized floss in two sizes, 98c.

No. 779. Design for a stencil to be used for sofa pillows, scarf ends or any decorative object and which can be repeated to form a border. Stamped and tinted on crash with green duck back, 30c. Stamped on crash 1½ yds. both ends tinted, with floss to work, 35c.

No. 611. A design of the poinsettia flower and leaves suitable for embroidering a sofa cushion or which may be used for curtain decoration. Tinted in fast colors on tan art ticking, 22x22 inches, with green duck back and mercerized floss to work, 40c.

No. 557. A design for embroidering a baby pillow, a sofa cushion or a centerpiece. The pattern measures thirteen and one-half by seventeen and one-half inches. Stamped on 21x16 inch White Pure Irish Linen, with mercerized floss to work, 60c.

Transfer patterns of the above, without materials, 10 cents each.

Cooking for Diabetics.

Could you give some recipes for cooking for diabetic patients? It seems difficult to find many dishes without starch or sugar. I should like to hear from other readers who have had experience in this respect. A. W. G.

Diabetics must avoid sugar and starch, hence potatoes, cereals, dried beans, peas, and fruits are prohibited. For beverages, buttermilk and skim-milk are given; tea and coffee are avoided. Fish, meat, green vegetables and gluten bread are the staples. Perhaps some of our readers may be able to help the perplexed housekeeper with recipes developed from personal experienc.

To give a book is to enrich the receiver permanently; to put into his or her possession something which leaves a residuum of pleasure long after the particular day on which it was received has been forgotten.—Hamilton W. Mabie.

Other Ways With Salt Pork.

That salt pork leads in "energy producing foods," was news to hosts of people who attended the Children's Welfare Exhibit in New York two or three years ago. Most of us had been faithfully taught, by our books and "past masters" in things physiological, that this was the one meat that was to be avoided as one would shun the plague. Some of us had turned our backs on pure theory, and tried to be practical (when teaching in pork-raising localities) by showing proper combinations of nitrogenous foods with the fat, and how so to cook the pork that it would not only assimilate readily with other foods, but also make them more palatable. Robbed of all technical terms, the following recipes will be found well-balanced as to food elements and attractive to the palate.

Roast Salt Pork.—For a family of six select a "slab" of larding pork that weighs about three or four pounds—long and narrow, rather than square in shape. Dip it in a pan of boiling hot water, and lay it on a plate for one minute to drain before wiping dry with a soft cloth. Cut, with the rind side uppermost, to within an inch of the base, into thin slices, which will be held together by this inch-piece. Place in a small dripping pan rind up, and put in a hot oven, to roast, allowing 20 minutes to the pound. The slices should lean over from the center toward each end, naturally; and if the oven is hot enough, each slice will get rid of its fat and will be a crisp, golden brown, breaking at the touch of a fork. If too hot, open the oven door, or lift a stove-lid a bit, to prevent even a sign of "scorch." Take up on a hot platter. Drain nearly all the hot fat out of the dripping pan—saving for future use, of course—and make a milk gravy with what is left in the pan. Serve with johnny cake, corn bread, graham or rye bread, mashed potatoes; stewed tomatoes and baked beans; with baked apples and coffee for dessert.

Boiled Pork Balls.—Select a piece of "fat and lean," wash as above; plunge it into a kettle of boiling water, and keep it boiling under cover until tender enough to let a fork pierce it with ease. Remove the skin, or rind (saving it to grease the baking tins for bread, or the griddle for cakes) and chop the meat fine with twice its bulk of dry bread. Add half this bulk of mashed potatoes, and "bind" all with a well beaten egg. Shape into disks, dredging the tops with flour, and fry on that side. When a light brown, flour the other side and turn, to fry on that side Serve on a hot platter, with potato salad, milk gravy toast, and boiled onions.

Baked Pork and Eggs.—In a shallow enamel pie-plate, lay as many very thin slices of salt pork as you have people to serve. Put in a hot oven; and when the slices are browned slightly turn them the other side up, arranging them with a space between. Break an egg into each space; place a tiny bit of salt on each egg and return the plate to the oven. If your people like their eggs "hard," turn them, letting them brown on both sides, slightly. Have ready a hot platter with slices of well-browned toast that have been dipped in salted hot water. Lay the eggs on the toast, and take up the pork on a separate hot platter, draining each slice dry of all fat. As this is a particularly good dish for breakfast, it can be served with creamed potatoes, or with those that have been freshly boiled "in their skins" and milk gravy.

Fried Pork.—Cut the slices thin, and fry slowly, turning to fry both sides. When done until crisp enough to break at touch, lift to a dry hot platter. Make a smooth milk gravy with part of the fat, and dip slices of dry bread in it, piling on a platter. Serve with baked potatoes, egg salad, apple sauce, and coffee.

Pork and Rice Mound.—Chop raw pork into moderately fine bits, or put it through the meat chopper. Fry until brown. Drain off the fat, and add three times the bulk of dry boiled rice. Mix thoroughly, and fry some more, stirring occasionally. Empty to hot platter, and shape into mound, garnishing sides of platter with wreath of thin slices of sour cucumber pickles. Serve with stewed tomatoes, hot corn muffins, and coffee, cocoa, or tea.

Pork Loaf.—Boil until tender. Remove the rind. Chop fine with double bulk of stale bread. Bind with well beaten egg, season to taste, and shape into loaf for baking in large tin, or pack in smaller one. Cut into thin slices as wanted, hot or cold, hot, with potato salad, and boiled spinach; cold, with creamed potatoes and stewed tomatoes.

When taking pork from the water in which it has been boiled, add chopped onions, rice (or pearl barley) to the liquid, and boil slowly for next day's soup or stew.

Pork Salad.—Boil lean salt pork until very tender. Separate all the fat, and save that for a "loaf" or some other concoction above mentioned. Cut the lean meat into moderately coarse pieces, in a cool bowl with an equal bulk of dry bread crusts, cut somewhat smaller; add the same bulk of celery stalks and of cabbage cut rather coarse, after crisping each in cold water. If you had a bowl of meat, you will now have four bowls of salad, to be thoroughly mixed, over which pour a thick mayonnaise dressing—and your salad will be "fit for a king." Serve with stewed beans; cheese sandwiches, or hot biscuits.

Pork and Onion Omelet.—Fry, to a brown, dry crisp, without a hint of scorch, as many thin slices of fat pork, as you have people to serve. Chop it into an equal number of slices of dry bread, and add half this bulk of onions, chopped very fine. Mix thoroughly, beat as many eggs as you have bread slices, adding two tablespoons of milk and one of cream for each, and beat well. Drain off nearly all the fat that is in the frying pan, and put in the bread, pork and onion mixture, stirring lightly. Sprinkle a little salt, but very little, and stir again. Pour over all the beaten eggs and milk, and set in a slow oven to bake. When done to a fair—but not dark—brown, slide it off on a hot platter for immediate service. An excellent supper dish. Serve with baked potatoes, and stewed tomatoes.

Pork Chowder.—Fry, until crisp, as many thin slices of pork as you wish to serve dishes of chowder. Lift out, and break them into bits on a hot plate, setting it aside on the back of the range, while you fry, in the fat and until well browned, as many thick slices of onion as you had of pork. Cover and set them back while you wash and chop fine as many small, or half as many, each, carrots, celery and potatoes as you had slices of pork. Add these, with farina, boiled rice or pearl barley in the proportions of a cup of these to two cups of the chopped vegetables—to the browned onion. Put all, including the pork, into a big kettle, and add (canned or raw) tomatoes to taste; with water in proportion. Cover, bring to a boil, and add salt, and pepper if wanted. Set it back to simmer for six hours, stirring occasionally, to prevent sticking. Serve in hot dishes, with hot crackers or bread sticks. If water is added at any time, stir thoroughly and again bring to a boil, letting it simmer again before serving.

LUCY A. YENDES.

Two Tested Recipes.

Cream Muffins.—Two level tablespoonfuls of soft butter, two level tablespoonfuls sugar. Beat the whites of two eggs to a stiff froth, add the unbeaten yolks to the butter and sugar and cream together, then add one cup of sweet milk, one-half teaspoonful salt, two cups sifted flour and two large teaspoonfuls of baking powder. Beat well, then add the beaten whites of the eggs. Carefully fill muffin pans two-thirds full and bake 20 minutes in a hot oven. Substitute one cup of graham, cornmeal, rye, or entire wheat flour for one cup of wheat flour and you will have different meal muffins.

Mother's Fried Cakes.—Two eggs, one cup of sugar, one cup of sweet milk, two tablespoonfuls of melted butter (or lard), one teaspoonful soda, two teaspoonfuls cream tartar sifted with the flour, just flour enough to roll out and cut. Flavor with nutmeg or to taste. As I remove them from the hot fat I place them on paper and that absorbs the fat from them.

THE HEAVY FEEDING COW.

On page 1365, "Why is the Purebred Better Than the Scrub?" H. E. Mern, in discussing, compares cow No. 27 with cow No. 62, an experiment conducted at the Missouri Experiment Station. In his conclusions he says: "If No. 27 had been limited in feed to amount eaten by No. 62, her production would have been reduced practically to that of No. 62." Do I understand him to say that if both cows were fed same amount of grain they would practically have produced alike? The point I am desirous of having explained is, did the amount more produced by No. 27 over No. 62 pay a profit on the more feed consumed? Cow No. 27 produced more than cow No. 62, but she also consumed more. Did the value of the extra production leave any balance after the value of extra feed consumed was paid? If I have two cows fed alike they will produce alike. Now one cow has a greater capacity for consuming feed. I give her more feed and get a greater product. The product is sold. I use the extra money to pay the extra feed. Who is benefited? It looks to me as if the feed man is. What benefit is that to me? The voidings of the cow may be worth more, but more labor was required, which will naturally offset the gain there. If I get an extra $5 for the extra production by feeding an extra $5 worth of wealth all the pleasure I have is passing the $5 from creamery man to mill man. That is doing business, but who can raise a family on such business, let alone the paying of interest, depreciation and taxes? The more concrete examples we have the clearer will be the horizon. J. F. F.

Ohio.

In answer to J. F. F., I will say that he is right in understanding me to say that the two cows would have produced practically alike if they had been given the same amount of feed. I will say further that in keeping cows which can consume and utilize a large amount of feed he is not only passing money from the creamery to the mill man, but he is also taking out a toll which will get the piano and pay for the music lessons for his girls and send his boys to college. I think a little more exhaustive examination of the figures from that Missouri experiment than I could put in the article will make this clear, and will also make it clear that this extra feed is the feed which produces the gain. To do this I shall introduce here some figures which because of the space they would take and the tediousness they would introduce, I could not put in the article.

First let me show that the cow, No. 27, which ate the most feed really made the most profit for her owner:

POUNDS OF FEED EATEN AND BUTTER FAT PRODUCED.

		Grain	Hay	Silage	Green Feed
No. 27.	Feed	3424	2904	8778	4325
	Lbs. butter fat	469			
	Feed per lb. butter fat	7.3	6.2	18.7	9.2
No. 62.	Feed	1907	1698	5088	2102
	Lbs. butter fat	169			
	Feed per lb. butter fat	11.3	10	30.1	12.4

It is evident from this that the cow which ate the more feed during the year actually ate less per pound of butterfat which she produced. The same comparison would be made, using the milk production to measure by, and it would tell the same story. From this it should be plain that the heavy eating cow produces more than enough extra to pay for the extra feed, although at the same time it may not seem reasonable. I think, however, that a careful examination of the facts will make it seem not only reasonable but almost inevitable.

The food of warm-blooded animals may be divided into two portions, according to the ultimate use made of it, a maintenance portion, and a portion with which growth is made, fat laid on, products elaborated, or work done. An animal's temperature must be kept at approximately 98 deg. Fahr., and it must do a certain amount of muscular exercise—walking about the lots, masticating food, etc. It takes a certain amount of food to furnish the energy for these things. This is the maintenance portion. If now, we feed a maintenance ration, the animal can live comfortably, but cannot lay on fat, and cannot do work or elaborate products, such as milk, except at the expense of its own body tissue. If, instead, we feed one pound more than a maintenance ration, there is one pound which can be used for production—be it wool, milk, growth, fat, or work. If we feed two pounds extra, there are two pounds which can be used for production. Now, note that we have doubled the productive portion of the feed, *but we have not doubled the entire ration.* The maintenance requirement remains practically constant. The following tables and diagram show how this worked out in the Missouri experiment:

PORTION OF RATION AVAILABLE FOR MILK PRODUCTION.

		Grain	Hay	Silage	Green Feed
No. 27.	Consumed during year	3424	2904	8778	4325
	Maintenance for year	1201	1204.5	4818	
	Available for milk production	2223	1699.5	3960	4325
No. 62.	Consumed during year	1907	1698	5088	2102
	Maintenance for year	1066	1066	4292	
	Available for milk production	841	632	796	2102

RATIOS BETWEEN FAT PRODUCED AND AVAILABLE FEED.

	No. 62	No. 27
Available feed	1	2.64
Fat production	1	2.77

	No. 62	No. 27
Maintenance 35% of ration	Used for Milk production 65% of ration	
		No. 27.
Maintenance 55.8% of ration	Used for milk production 44.2% of ration	
	No. 62.	

Thus we see that while the maintenance rations were nearly the same (somewhat in favor of No. 62, to be exact) and while No. 62 really produced a little more butterfat per pound of feed available for milk production, she ate so little feed that this amount was very much less than in the case of No. 27. She ate something more than half as much as No. 27, but the amount which she had available for production was considerably less than half what 27 had. It is reasonable, therefore to expect a production in proportion. In other words, we should expect production not in proportion to the total amount fed, but in proportion to the amount eaten and assimilated *after* the maintenance requirement is met; and we should expect the last pound so disposed of to make the largest profit.

There are one or two things that this experiment does not show, however. (1) It does not show that we should feed liberally and then select the animals that eat the most, because some animals have poor digestive and assimilative powers, and much of what they eat is voided. What we should do is to feed liberally and then select those animals which produce valuable commodities at the least cost. They will almost always be the highest producers and the heaviest feeders. (2) Neither does it show that under ordinary circumstances it is good practice to pamper the appetites of animals in order to induce large consumption of feed, because then the extra care and high price of feed will often be so great as to render the returns inadequate to produce a profit. In fitting animals for show or in making a record of some kind this practice is necessary, but such conditions are unusual.

The experiment does show, though, and I should like to repeat it, that in general, the greater the ration the greater the production; and that you don't know what a good animal can do until you have fed a heavy ration. As long as you feed but little more than a maintenance ration you cannot tell the good animals from the poor ones.

H. E. MERN.

Value of Silage.

What is the value of green corn per ton when cut and delivered to the silo ready to cut, when Alfalfa hay is worth from $12 to $14 per ton and carrots $5 to $6 per ton? Oats $1 to $1.25 per hundred, bran $1 per hundred, straw $2 per load. As a rule our corn does not mature sufficiently to make a good crop of ear corn. G. M. B.

Silage in the silo is usually figured at about one third the value of good hay, or, ordinarily, at from $3 to $4 per ton. The expense of operating the cutter would have to be deducted from this in order to calculate the value of the corn delivered to the silo. By dividing the cost of the cutter and its operator per hour by the number of tons that it will elevate into the silo in that time, working under normal conditions, you will get the amount to be deducted from the ton price of silage to find the value of the green corn. It might be calculated in other ways, as by adding a fair profit to the cost of production of the corn, if that were known. Where such transactions are common, values become fixed by common consent and are worked out to a fair basis, but it is difficult sometimes in unusual transactions to arrive at a just basis for compensation. M. B. D.

Molassine Meal
MADE IN ENGLAND
Unique—Distinctive—Superior
It is made by a *specially prepared process* which produces a feed absolutely unlike anything else in the world.
For 20 years it has watched imitators come and go, but today Molassine Meal holds the field as the *one and only feed* of its kind that *will produce the results* claimed.
It is today being fed and recommended by Agricultural College graduates, who having carefully educated themselves in the theory of farm problems, now find Molassine Meal in every day practical farm life produces most satisfactory results.
Insist on having Molassine Meal, as nothing else will take its place.
If your regular grain dealer will not supply you, write us—in fact, write us anyway, for we are quite sure we can improve your feeding ration.
MOLASSINE COMPANY OF AMERICA 326 Board of Trade, BOSTON, MASS.
St. John. Montreal. Toronto. Winnipeg.

$15.95 AND UPWARD
SENT ON TRIAL
AMERICAN CREAM SEPARATOR
Thousands In Use giving splendid satisfaction justifies your investigating our wonderful offer to furnish a brand new, well made, easy running, easily cleaned, perfect skimming separator for only $15.95. Skims one quart of milk a minute, warm or cold. Makes thick or thin cream. Different from this picture, which illustrates our low priced large capacity machines. The bowl is a sanitary marvel and embodies all our latest improvements.
Our Twenty-Year Guarantee Protects You
Our wonderfully low prices and high quality on all sizes and generous terms of trial will astonish you. Whether your dairy is large or small, or if you have *an old separator* of any make you wish *to exchange*, do not fail to get our great offer. Our richly illustrated catalog, *sent free of charge* on request, is the most complete, elaborate and expensive book on Cream Separators issued by any concern in the world. *Western orders filled from Western points.* Write today for our catalog and *see for yourself* what a big money saving proposition we will make you. Address.

HIGH GRADE HOLSTEINS
The best are the cheapest. Why not have that kind? We have 200 large, well bred cows that are heavy producers. Some fresh and others due within 60 days. Tuberculin tested. Come and see them.
F. P. SAUNDERS & SON, Cortland, N. Y.

A Good Animal Should Never Possess a Scrub Owner.

"I am very careful to whom I sell my calves," remarked a successful Ohio breeder a few days ago. "I have been laboring for a number of years to build up a purebred herd of efficient producers. The cows evidence their breeding in their performance at the pail. My herd has a good reputation, and I want to keep it good. It would be unbusinesslike for me to sell a bull calf from one of my best cows to some scrub farmer who would rear the calf on whey, keep him all Winter on poor hay in an airtight stable, and turn him out in the Spring with his herd looking like a scarecrow. The calf would be stunted, he would fail to make good, and then the farmer and his nearest neighbors would point to this bull as coming from my herd. That is the reason why I am careful about the man to whom I sell my stock. I want them to return him a profit and I look to it that he is mentally equipped and his farm is sufficiently equipped to insure the best results from my stock.

"This is only a business proposition," he added, "in building up and maintaining of your herd. See the right man gets your stock." WALTER JACK.

Building a Milk House.

I wish to build a milk-house in which to separate milk by hand separator, and will build it by side of water trough, into which water comes from pipe 200 feet from spring. I shall let the water flow into milk-house and use ice to keep cream a few days. Which is the better way, to put ice in water trough where cans stand or put ice only above cans? I thought of putting trough below level of floors in milk-house, let water flow in and put ice in water if necessary, as I have a houseful of ice. Will build house of boards with concrete foundation and floor. I intend to sell cream to ice cream factory. C. R. B.

Pennsylvania.

Your plan of building a house of wood with concrete foundation and floor is a good one, and I would suggest making a tank of the desired size in the floor of the milk-house, but enough higher than the water trough outside so that the water from the spring will ordinarily flow through the tank to the trough. In this way you will get cold water direct from the spring for use in cooling the milk, but I should also arrange for a by-pass for the water directly to the outside trough, so that when ice was used in the cooling tank the water from the spring need not be allowed to constantly run over it and waste it. The ice will be used most economically by putting it into the tank with the cream cans.

M. B. D.

Grade Calf.

I have bought a Guernsey bull calf whose sire was a registered bull and whose dam was three-quarters purebred. What part Guernsey may I call the calf?
A. J. T.

The calf takes half its breeding from each parent. From the bull it takes half Guernsey blood and from the dam three-eighths. It is therefore seven-eighths Guernsey.

PROFITABLE PIGS.—These figures on the loss and profit of three pigs born April 1, 1913, and sold Nov. 11, 1913, may interest, and show there is a profit in pigs even if all feed that is given them is purchased: Born April 1, 1913; were with mother until June 11, when she was sold for $45, live, the butcher taking her at the barn. Grain and feed purchased January 1 to November 1, $39.82; sold November 11, 1913, weight alive 960 pounds, $100; profit, $60.18. They had the run of a small orchard back of the barn during the Summer, and after the first of May. There are less than two acres in the orchard, which is in grass. They could not begin to keep grass down, and it was cut by machine in July and left on the ground as a mulch. They could root and dig all they wanted, but after the drought came in June they did not dig much, as the earth was too hard. They were fed twice a day, a warm slop of two parts red dog middlings and one part cornmeal, what they could eat up clean at time of feeding. To each 12-quart pail of the slop was added a small handful of bone flour, ditto of charcoal and salt. Those last items I consider very important, the bone meal helps make bone, the charcoal keeps the stomach sweet, the salt is a mineral and helps also. HORACE B. PARKER.

Massachusetts.

MILKING MACHINES THAT DO MILK.

Milking machines that actually milk have not been much in evidence in northeastern Ohio until recently. In some way the cow and the machine did not get on very familiar terms, and the former never mistook the other to the extent of adopting it as her calf, and that is the relation that must exist between the cow and milker, whether a combination pump, or a human. Many kinds of machines were introduced, but their days were few and not to be desired. Still the call for a simple, effectual milking machine was not lessened, for the labor drought increased, and good milkers became less and less in number. Many dairies were cut down in numbers until the actual farm family could perform the labor. The trouble seemed to be with all of the machines, too much mechanism, tubing, failure to get the regular pulsating pull in extracting the milk, and in some way not milking out the cow anywhere "clean," necessitating much hand milking to complete the operation, which meant cows getting "finicky," half giving down their milk, and later disgust with the whole thing, and returning to hand milking.

With the advent into public view of the Geauga County, O., Breeding Community, with its cows that were actually giving from 10 to 14 tons each of milk per year, came the introduction of a yet later milking machine, so simple in construction and dispensing with so much mechanism, that they have become very common hereabouts with both large and small dairies, regardless of "community" ownership, and on much inquiry I find they are giving satisfaction, and none has been given up or returned. As said by a neighbor the other day, with his 50 big Holstein cows, after six months' trial: "I shall not go back to hand milking. It milks better than we can! The little engine broke a part two weeks ago, and we had to hand-milk three days, and the cows shrank 90 pounds, and when machine milking was started again, the cows came back to the old notch in five milkings!"

The other afternoon I went across to see neighbor Cooley milk his 30 head of Holsteins. He has had this machine nearly a year, and one man now does the milking, instead of three milkers. It so happened that all were gone away except an 18-year-old boy, who said "They won't be home till late, but I do the milking," and soon he had the cows in their stalls, and the meal sprinkled. Then he got out four milking machines, started the engine, set the pails, attached the machines each just four milking cups, with eight inches of tubing to reach the pail, then a connection that worked the little pump at the base of the teat cups, and instantly the milk began to flow into the open cup in regular pulsations, then hand-like reaching up onto the udder for another stream. This boy was now milking four cows at a time. As fast as a cow was milked he put the machine at work on the next cow, took the milk to the cooler, and so on until the two long stables of cows were milked. No hand stripping was done. Not a cow resented the innovation or lifted a foot, only to "hist" over to have the machine attached. When he came to a hard milking cow, the boy put a smaller-orificed ring into the cup, and the operation of milk drawing was perfect. One big cow that gives about 60 pounds of milk a day, and milks so hard that it takes 20 minutes of hand milking to get it, was as cleanly milked in seven with the machine. "You see," said the boy, "if you milk a hard cow with the common-sized ring, it pulls the teat down into the cup so far that it cuts off the flow. It can't do that with the smaller ring." Some young heifers were milked without show of uneasiness, and an old "kicker," bought cheap because she did kick hard and much, has never raised her foot when milked with the machine, and that from the start. The boy had now milked the herd in less than 50 minutes, and cooled the milk ready to bottle.

"How much milk have you left in the udders, do you suppose?" Well, stripping the herd, the first cows now having been milked over 50 minutes, showed about nine pounds, a result that would have followed hand milking. "Oh yes," continued the boy, "now and then a cow gets balky, but she will be all right the next time, and gives down as well as ever."

Then the engine was stopped, and the milking cups and short connecting tubes taken to the pump and water forced through them, and then well rinsed, then thrown, cups and all, into a small bucket of weak brine for the night. Next day they would be given a more thorough washing, and then returned to the brine bath. "You see," said the boy, "we have a six horse-power gas engine. It wants a steady motion, one that does not vary, and the little engine would run fast and slow. That's part of the secret in machine milking, a steady pull. Then this engine runs the farm water works pump, the silage cutter and farm machinery, besides the generator and milking machines, and we don't have to crowd it to get power." Then he disconnected the long milking shaft rod from the engine, and touched a switch, and instantly the barn was ablaze with 15 electric light bulbs.

"Didn't you notice this generator?" said the boy. "When I was milking, the engine was turning this generator, sending 'juice' up into the storage battery, and we light up the whole place, house and all."

Well, what had we to say? Here was a boy milking 30 cows alone, and doing it week after week, and not a complaint. We went home, and began to call up the others, who had like machines. Everyone was satisfied and would not have them taken out under any consideration.

"How does your milk stand in the market as to germs, and such like jeopardizers of the public health?"

"No complaints from the health board."

"What criticism have you got to enter against the milker?"

"None, only that I ought to have had it 10 years ago. It needs to be rightly managed and kept in working order, the same as any mechanism, but it is rare to have a working part go wrong."

Ohio. JOHN GOULD.

"WHEN I was once in danger from a lion," said an old African explorer, "I tried sitting down and staring at him, as I had no weapons." "How did it work?" asked his companion. "Perfectly! The lion did not offer to touch me." "Strange! How do you account for it?" "Well, sometimes I have thought it was because I sat down on a high branch of a very tall tree."—Melbourne Australasian.

New Idea Manure Spreader

Does More and Better Work

It makes a better day's work easier. Besides thoroughly pulverizing all kinds of manure, it spreads it wider and more evenly. Because of their simple construction and durability New Idea Spreaders are the

Business Farmer's Choice

Here are a few of the many points wherein New Idea Spreaders surpass: 2 pulverizing cylinders, besides a special distributor; its simplest of all feeding mechanisms never jorks; the gearless drive transmits power direct from rear axle to cylinders. Strongly built, yet light, this ideal spreador is almost trouble-proof.

Large, Illustrated Catalog FREE

If interested in spreaders let us send you a copy. Explaining the thorough construction of our machines. Illustrated. Write for Yours today.

New Idea Spreader Co., Box 115 Coldwater, Ohio

Sows Fertilizers QUICKLY EVENLY

Sows broadcast or in rows all kinds of commercial fertilizers—nitrate, phosphate, guano, lime, ashes, etc. Distributes it fast and evenly in amounts from one hundred to several thousand pounds per acre. Simple and strong. Gauge is easily and quickly set.

The Chicopee Line

STEVENS Fertilizer Sower

Has only force feed which will sow successfully all kinds of commercial fertilizers in large or small quantities. No springs or gears in box. Order one this season. We'll refer you to a dealer if none near you. Send today for 64-page Catalog of Chicopee Line tools—the line of 61 years' sterling reputation. There's an implement for every farm need.

AILING ANIMALS.

Garget.

Will you inform me what you would rub on fresh cow whose udder is caked?
New York. H. H. W.

Foment with hot water three times a day, massage perfectly at the same time and then rub with a mixture of one part each of fluid extracts of poke root and belledonna leaves and six parts of warm sweet oil or melted lard. Feed light, laxative rations. Dissolve two teaspoonfuls of saltpeter in the drinking water twice daily for three or four consecutive days a week, until the udder is normal.
A. S. A.

Cholera.

I had a drove of 27 hogs. They all had the cholera and all died but two sows. I expect both sows to farrow in March. The bear died with the cholera and both sows had it, but got well and are now in good condition. Would the pigs from those sows, be immune? Would it be necessary to build a new hog pen, or do you think it is all right to leave them where they are? C. F.

Pigs of immune sows have a slight degree of immunity for a few weeks, but it is not worth counting upon as protection. The pigs should be vaccinated with serum alone and when 50 pounds or so in weight should be vaccinated with serum alone and in one week with serum and virus simultaneously. They will then be immune for life. Clean up, disinfect and whitewash the hog house and pens, including the floors; then use nothing but immunized hogs. A. S. A.

Greaseheel.

Will you give me a cure for greaseheel on horses? I have one that the veterinary gave me medicine for. While I use the treatment it seems to dry up and be all right and when I stop using, it breaks out again. P. S. O.

The disease is constitutional, so that local treatment alone is insufficient. Make the horse run out daily or work every day and live on corn fodder, hay, straw and roots in Winter and grass alone in Summer. Groom him every day. Poultice the affected parts for a few days with hot flaxseed meal, mixing in each poultice two ounces of powdered wood charcoal and two teaspoonfuls of coal tar disinfectant. Wash clean and dry perfectly on discontinuing the poultices; then apply several times a day a lotion composed of one ounce each of sugar of lead and sulphate of zinc to the quart of soft water. Write again later, if this does not suffice. It may be added that in bad, chronic cases it is well to give the horse a tablespoonful of Fowler's solution of arsenic right along until well; then gradually discontinue the medicine, taking at least a week to the work. A. S. A.

Lice.

I have about 60 hogs and pigs that are lousy. How can I get rid of the lice? Can I spray them at night when they lie down? Will kerosene, not diluted, injure the hogs? What is the best thing to use and how? P. F.

Spray and scrub with a solution of coal tar dip made and used according to the directions given by the makers, or apply a mixture of equal parts of kerosene and machine oil along the backbone by means of an oil can. Do not use full strength kerosene and do not use kerosene or a mixture of it on a sow with pig, as it will be likely to cause abortion.
A. S. A.

Indigestion.

1. A 1,500-pound brood mare has what the doctor calls anæmia, and now and then gets indigestion. We feed one quart oats, one quart bran, one pint linseed meal, four ears corn, mixed hay and corn fodder. Advise me what to do. 2. A cow is down in flesh; eats well but does not seem to thrive. They seem to have lice. 3. How best get rid of lice on cattle and horses? 4. I raised twin colts; I would like to have a formula to mix feed for them of right proportions to be a good economical feed, and how much of same a day? C. A. G.
Massachusetts.

1. Have mare's teeth attended to by the veterinarian; also have the hair clipped from her belly and from her legs above knees and hocks. Allow free access to rock salt, give the drinking water before feeding and work or exercise her every day. Feed whole oats and one-sixth part of wheat bran, by weight, allowing 1¼ pounds per hundred pounds of body weight of mare as a day's ration. Also allow a few ears of corn at noon, while weather is cold. Give a like amount of good mixed clover hay per hundred pounds of body weight. Carrots would form a beneficial adjunct to the rations. Give her half an ounce of Fowler's solution of arsenic night and morning for a week, then three times a day until she is doing well when the medicine may be gradually discontinued, taking 10 days or more to the work. 2. Have the cow tested with tuberculin, as tuberculosis is to be suspected. 3. Lice may be killed by using a solution of coal tar dip at intervals, as advised by the manufacturers. The stables also should be cleansed, disinfected and whitewashed. 4. The colts will do well if fed equal parts of whole oats and bran, by weight, allowing one pound per hundred pounds of body weight as a day's ration, along with all the good mixed hay they will clean up. Roots may be added with benefit and if you wish to obtain maximum growth and weight sweet skim-milk may be fed. A. S. A.

Pining Cow.

I have a cow five years old, whose appetite has been failing for the last year; have had to change grain often to get her to eat any. Now she will eat no grain of any kind; will eat about one-third as much hay as she should. She appears bright and active but is growing thinner every day. I have noticed during the last week or two that her manure is becoming hard. I think that she was grained too heavily before I got her, which is nearly a year ago. What can I do for her? W. G. B.
New Hampshire.

Have her tested with tuberculin, and if she has not tuberculosis she may do better if you give her a physic and follow with half ounce doses of Fowler's solution of arsenic and dram doses of fluid extract of nux vomica twice daily right along. Feed plenty of nutritious feed; but she may not improve before she can run on grass in Spring. A. S. A.

Warts.

I have a two-year-old heifer which has a large wart on her nose and a dozen or more the size of buttons, coming. The large one is ragged and as large as a teacup. What can I do to take it off and stop the others growing larger?
F. H. L.

Twist off the large wart, or ligate its neck tightly with a fine cord. If it is not a cancer it will not be likely to return; but also lightly cauterize its base with lunar caustic pencil. If it is a cancer it will return worse than ever and is incurable. Masses of small warts may be removed in time, by rubbing daily with best caster oil or fresh goose grease. A. S. A.

Paralysis.

I have some pigs that can hardly get up; they have been fed warm water meal and white middlings. They are in good order. They have rather a cold place. They squeal and act helpless; eat a very little whole corn. The place they have been in is just cold enough so it froze the top part of the hens' combs which were next to their pen. They weigh from 100 to 150 pounds live weight. Do you know any help for them? C. W. K.
New York.

Overfeeding and lack of exercise bring on this condition, which usually is associated with rickets. Worms may be a complication. Add limewater freely to the slop, and make digester tankage a 10 per cent. addition to the ration. Make the pigs work for any corn or whole oats they get, by rooting for it on a big barn floor covered deeply with litter. Exercise is imperative. Allow free access to slaked lime, wood ashes and charcoal. Feed roots to regulate the bowels. A. S. A.

Mix Your Own Feed!

More Beef, More Milk, More Money

The prize cattle of the world are invariably fed on a ration containing linseed meal. Dairy experts and scientific feeders everywhere agree that linseed meal is the cheapest and best source of digestible protein—gives the best balanced ration. Better than "ready mixed" feed, better than cottonseed meal, not alone because of its economy and value as a *beef-maker* and *milk-maker* but as a *conditioner* for cattle and other kinds of stock. Linseed meal keeps the digestive organs of farm animals in healthful, vigorous, working order.

HYPRO Linseed Meal not only cuts down the cost of grain feed but increases the effectiveness of both grain and roughage in your rations by supplying *protein*, the nutritive element that makes energy, milk and beef.

HYPRO Pure Linseed Meal, in connection with oatmeal and skimmed milk, is the best substitute for whole milk in feeding calves—saves the calves and enables you to raise them profitably.

HYPRO Linseed Meal

HIGHEST IN PROTEIN

This brand of linseed meal is made and guaranteed by the largest manufacturers of linseed meal in the world. *HYPRO is highest in protein value* and the best and purest linseed meal on the market.

Nothing but the highest grade flax seed grown is used. It is thoroughly sifted by a special process which removes all impurities.

You get the pure linseed meal unadulterated and free from sediment of any kind when you buy HYPRO brand. Don't buy "any old kind" of linseed meal. Look for the HYPRO label and get the genuine. Costs no more than unknown kinds.

36% Protein Guarantee Measured by *units of nutrients*, not by cost per ton, HYPRO Linseed Meal gives full measure of feeding value. It is the cheapest food you can buy because you get the greatest amount of *protein* for your money. *We guarantee you 36%.* Agricultural statistics on feeding show that Pure Linseed Meal like HYPRO contains the highest percentage of digestible protein of any food you can buy. Whether you use it by the carload or in co-operation with your neighbors, HYPRO Linseed Meal will prove a profit-maker.

Don't Buy "A Pig in a Poke"

Why take chances on "ready mixed" rations when you can get the genuine HYPRO Linseed Meal—**guaranteed to contain 36% of protein**—and DO YOUR OWN MIXING?
Don't run the risk of adulteration.

Valuable Ration Book Free

With the assistance of the foremost dairy experts and scientific feeders in America we have compiled a wonderful Ration Book, worth dollars to any stockman, dairyman or general farmer. Tells how to prepare balanced rations to meet all feeding requirements in different sections of the country. This book might well be termed "The Gospel of Linseed Meal."

You get a copy free, postpaid, by sending the coupon or postal card. It's an "eye-opener" on the feeding question. Tell us the number of cattle and other animals you are feeding and give us the name of your feed dealer.

A Word for the Cats.

I submit that a good cat has as valid a claim to be included among the live stock of the farm as the dog. We hear a great deal in the columns of the farm press of the faithful and intelligent collie, and rightly so, but the virtues of the feline tribe are suffered to remain unsung. I protest against this manifest injustice. Statistics tell us that the annual damage to farm products by rats and mice mounts up into the millions of dollars. Any agency capable of conserving this lost wealth is certainly deserving of publicity and fame. I maintain that a well-kept cat is a valuable farm asset, and fully worthy of record in the inventory of the live stock. Poison is effective against the rodents only in an intermittent and hazardous way. Sometimes it succeeds, sometimes it fails, and between times the cornerib suffers. Well-kept cats will keep the sly marauders in perpetual subjection, and never permit them to become destructive.

What is a well-kept cat—for I always qualify the name? I reply one that is kindly treated but not made a children's plaything; one also that is well and regularly fed. But, you exclaim, they should live on rats and mice, and other prey. Not at all, no more than the hound should subsist on the fox or the pointer on the quail. My experience is that the best cat hunters are those best fed and quartered. My four cats are fed as regularly and as well as are the horses and other stock. Nor are the casual table scraps to be considered a ration, but prepared messes of meat, raw or cooked, with gravy-soaked bread, potatoes and other substantial things, and all fed warm in cold weather. Meat should be the main food, no matter how many rats they may be catching, and I do not approve of much milk for grown cats. You cannot dull their hunting propensities by overfeeding. My cats, all nenters but one, were treated when kittens and grew prodigiously fast into big, fat, sleek animals, as handsome as their wild congeners of the woods, and with fur as shiny as my lady's muff. Such cats are peaceable, do not rove, and maintain steady warfare on the rodent family. I estimate the work of my cats at a greater cash value than that of my dog. They are as quick to recognize my voice and follow me about with equal affection and pleasure in human companionship. Their suppleness, grace, agility, playfulness and tigerish stealth and beauty delight the eye. But however regarded, they should never be enervated in warm rooms or fed on other than plain, wholesome food.

L. R. JOHNSON.

Cape Girardeau Co., Mo.

A Good Dog Law.

I note your correspondent's inquiry for a law that shall be effective in protecting sheep from dogs, and desire to review briefly the Maine law which was enacted 20 years ago. It has remained practically without change ever since, and has proved as effective as I believe it is possible for any law.

This law provides that assessors of taxes shall include in their inventories lists of all dogs owned by or in possession of any inhabitant on the first day of April, each year. These lists are returned to the Treasurer of State, and towns are required to return to the same Treasurer of State on or before September first of each year a sum of money equal to the license required. This money is credited, by the State Treasurer to a fund called "Dog Licenses." All dogs shall wear collars showing name of owner and the license number. The amount of the license is $1.15 for each male dog and each female dog incapable of producing young and $5.15 for each female capable of producing young. The 15 cents is retained by the town clerk who issues the license. Kennel licenses are granted to owners or keepers of dogs for breeding purposes, if said dogs are kept within proper enclosures. Dogs covered by kennel licenses are exempt from the provisions requiring registration, numbering and collaring. Ample provisions are made for destroying all dogs whose owners or keepers have not complied with the law, and my observation is that very few escape.

This law is also peculiar in that it provides for the paying of losses of sheep or other domestic animals by wild animals as well as by dogs. Whenever sheep or other domestic animals are killed or injured by dogs or wild animals, the owner notifies the municipal officers of such damage and under proper regulations, the loss is ascertained. Then the town may bring action against the owner or owners of the dogs, if it is ascertained that the damage was done by dogs and their owners can be found, or it may pay the owner of the animals their full value and 50 per cent additional. When such damages are paid by any city or town, the municipal officers thereof forward to the State Auditor a full statement of the amount and of the facts in the case, and the State immediately reimburses the town from its "Dog License" fund.

At the close of the fiscal year such a part of this "Dog License" fund as remains in the State Treasury is credited to the several cities and towns on their State tax in proportion to the amount each has paid into the State Treasury under the provisions of the law.

The State being the unit for distribution it equalizes the burdens and makes the dog licenses collected in cities help pay for the damages in the rural towns. This is particularly salutary, as probably in a majority of cases the damage is done by roaming dogs from the cities. The law recognizes the property value of dogs, and provides that whoever injuries or kills any dog whose owner or keeper has complied with the law, except that it shall be justifiable in the protection of venison, property or game, shall be liable to the owner in a civil action for the full value of the dog.

Maine, for some years previous to the passage of this law went through a period of fierce conflict led by extreme dog haters, who sought laws that would reward the shooting of any dog at any time by anybody, if the dog was caught off the owner's premises, on the one hand, and the keepers of hunting dogs and members of gun clubs, who wanted the freedom of the fields for their sport and a close time on all fur-bearing animals, even including the fox, on the other; but temperate councils prevailed and this law is the result. It has proved by its many years of life and its effectiveness that it can with safety be recommended to other States.

Maine. B. WALKER McKEEN.

Dog for Poultry Protection.

I notice a picture on page 35 of a dog which I take to be a bull, and which you say is better than a shot gun for thieves. I presume you mean in guarding the poultry. How can he do this when tied up, and if running loose will he not molest the birds? D. J. M.

The dog is turned loose at night and has the run of the yards. He has been trained to know the hens and lets them alone, seeming to know he is their protector.

"WHY do you call that pig of yours 'Ink'?" asked the visitor. "He isn't black." "No," replied the farmer. "I call him Ink because he is always running from the pen."—Credit Lost.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Fight depreciation with good paint. Depreciation is the certain follower of neglect. You know what sun and storm, unchecked, will do to your buildings. Fight them with the paint of proven merit for all outside work.

S W P

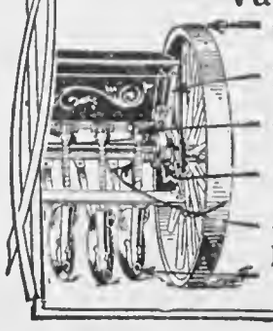
Bigger Crops—Better Grain—Less Seed

VAN BRUNT DRILLS

Famous for accurate feed, correct covering, light draft, light weight and durability.

These features made Van Brunt famous



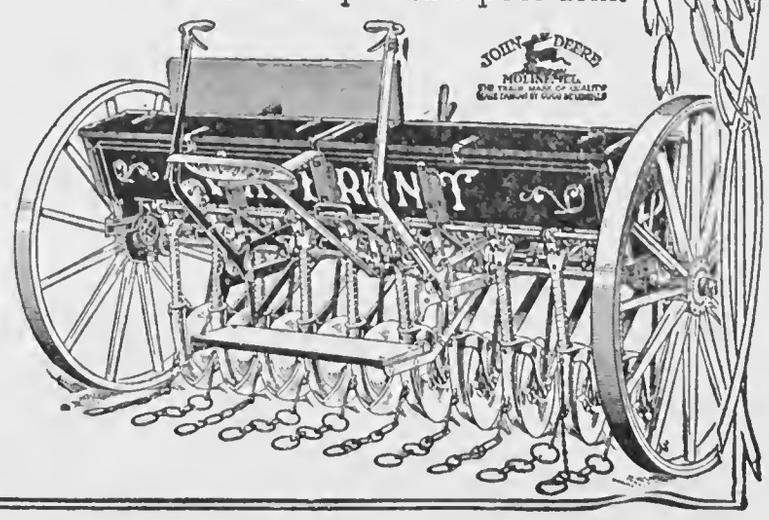
- Wheels always stand true.
- Hopper trussed—don't sag.
- Adjustable gate force feed.
- Bearings extend under frame.
- Adjustable spring pressure.
- Every seed at bottom of furrow.

Every grain grower should investigate the new and improved features of Van Brunt drills. The adjustable gate force feed, the successful fertilizer feed, the non-chokeable disc openers, the trussed hoppers, the light weight, the light draft,—all of these features combine to make the Van Brunt famous wherever introduced. Don't seed another crop with a poor drill.

Book Free

Every grain grower should have our new drill book. The improved features of Van Brunt drills make them most desirable. Write and ask for package No. VB 33

JOHN DEERE
MOLINE, ILLINOIS



EVENTS OF THE WEEK.

DOMESTIC — Sealed indictments against six stock brokers were returned Feb. 27. to United States District Court by Judge Hollister in connection with alleged stock selling frauds of Franklin's, Inc., candy manufacturers, whose president, Floyd N. Franklin, has already been indicted with Nova Adolphus Brown, broker, by the Federal Grand Jury. It is alleged that the six defendants continued to sell the company's stock to the public notwithstanding the first arrests. Before the first indictments, it is said, $500,000 in stock had been unloaded, and now the public has nearly $500,000 more. The Government contends that the company promised a profit of 1,000 per cent. on the sale of its stock. At the time the concern's stock was put on the market, it is alleged, the company's plant at Long Island City had not been completed. The names of the indicted brokers have been witheld.

The great storm of March 1-2 did great damage in and around New York, especially to transportation service of all sorts. Miles of telegraph and telephone wires were useless, having broken or sagged under the weight of snow and ice. The only direct service to Washington and the West from New York March 2 for newspaper or commercial use was by means of one underground system of wires. The Postal Telegraph Company, in order to reach the capital, flashed along this remarkable route: To Albany, to Montreal, to Detroit, to Chicago, to St. Louis, to Birmingham, to Augusta, to Atlanta, to Richmond, to Washington. New York was actually threatened by a famine in milk. Only 400,000 quarts of a daily normal supply of 2,000,000 quarts were delivered by the distressed railroads. Sixteen persons met death as a result of the storm.

March 2 Texas celebrated its Independence Day, and at Galveston, Broadway, Galveston's new street, was formally opened by the Board of City Commissioners, which closed the celebration of that event with the world's largest tango party. Broadway, which is 300 feet wide and 2½ miles long, was used for the dancing floor, the music being supplied by 15 military bands borrowed from the regimental detachments of the United States army mobilized there.

A modification of an act known as the "bar and bottle" bill, which forbids the sale of liquor in bottles over a bar, was urged by several liquor associations before a legislative committee at Boston, March 2, on the ground that the original measure, passed three years ago, had proved a failure. It was asserted that drunkenness had increased since the bill was passed. The liquor interests asked that the law be modified so that each city and town might decide whether such a measure was necessary. Any revision of the present law was opposed by representatives of the Anti-Saloon League.

The Supreme Court refused March 2 to review the decision of the Federal courts at New York holding the Waltham Watch Company could not fix the resale prices of watches by retailers. The Waltham Watch Company brought suit in January, 1913, against Charles A. Keene, a New York jeweler, to compel him to sell watches made by the company at prices fixed by the Waltham concern. The defendant's attorneys replied that Keene had bought his watches in England and was at liberty to sell at reduced prices. The United States Circuit Court of Appeals affirmed, in December, the decree of Judge Ray in District Court dismissing the suit, and in January the case was taken to the United States Supreme Court.

Fred Ayer finished first in the Solomon Derby dog race that was run from Nome, Alaska, over the snow trail to Solomon and return March 2. His time for the 64 miles was 6 hours 30 minutes 4 seconds. John Johnson, winner of last year's Derby, was a close second with his team of Siberian wolves, and finished two minutes after Ayer.

Twenty-five hundred miles by ox wagon is the journey that Charles Wasman is undertaking, and which he began March 2 at Regina, Sask., bound to Belleville, Ill., where he will attend a centenary celebration next September. With the idea of surprising his many friends and relatives back home, Wasman has bought a team of oxen, together with a prairie schooner on sleighs. He expects to make not more than 12 miles a day for the first few weeks, but after the oxen have become seasoned he plans to travel 20 miles a day, in order to reach Belleville on September 8. Wasman is a Saskatchewan homesteader.

Attorney-General Carmody of New York filed suit in the Supreme Court March 3 against the Mutual Profit Realty Company of New York to revoke the company's charter and for the appointment of a receiver to liquidate the company's business. The suit is a direct result of the recent decision of the Appellate Division that many real estate concerns which sell profit-sharing bonds or certificates to investors and use the money realized on the securities to speculate in real estate are doing a banking business in violation of the law. In October last the company was denied a renewal of its license to do business in Connecticut, where it had sold $700,000 of bonds. The Connecticut Building and Loan Commissioner declined to state the grounds on which he has refused to renew the company's license. An action was begun, but there has been no decision. The Mutual Profit Realty Company's last report, dated June, 1913, represented that it owned real estate worth $975,750, of which $590,500 is in vacant property, $326,000 is in vacant improved real estate, and $59,250 in improved real estate and buildings. The company owns only one parcel in Manhattan, a vacant lot appraised at $50,000.

Some idea of the enormous profits made by the Sterling Debenture Corporation through the sale of the alleged worthless stock of the Oxford Linen Mills, Inc., of Brookfield, Mass., was given in the United States District Court March 4 during the trial in this city before Judge Anderson of the eight men indicted with the Sterling Debenture Company for using the mails to defraud in the sale of the Oxford stock. According to a copy of the contract between the two companies, introduced by Assistant United States Attorney Kenneth M. Spence, the Sterling people agreed to take over the entire 200,000 shares of Oxford stock at prices ranging from $2.50 per share to $10 a share. An aggressive selling campaign, in which alluring circulars played a prominent part, enabled the Sterling company, according to Mr. Spence, to dispose of the same stock at from $12 to $15 per share.

John F. Linton, president of the Manhattan Mutual Realty Company and other concerns, of New York, who promised a 42,200 per cent return on his $1 a week "Home Coupons," was convicted March 4 of petty larceny before Justices Forker, Moss and Fleming, in Special Sessions, at St. George, Staten Island. The charge arose out of his "Home Coupons." On five of them he had collected $195 from Robert Shields, on the understanding that when Shields had paid $100 he could choose a lot wherever he would, and the Manhattan Mutual would build him a $3,500 or $4,000 house. Linton was paroled in the custody of his attorney to be brought up for sentence on March 25. Linton's scheme was of the "snowball" variety. At the time of his indictment last year, it was said that about six hundred of the "home" contracts had been entered into. Under the "endless chain" system each of these contracts would bring in $8,420, and Linton would have had 5,052,000 persons paying him $1 a week, and would have needed a capital of about $16,000,000,000 at least to erect the houses he had undertaken to build. It was shown that he owned then no real estate and had about $100 in the bank.

PARCEL POST CHANGES.—Efforts of both Democratic and Republican members of the Postoffice Committee to safeguard the postal service from the demoralization which is said to threaten it as a result of the increase of the weight limit of parcel post packages were defeated by the Senate Feb. 27. The committee amendment limiting the weight of packages which may be carried by parcel post to 50 pounds was rejected by a vote of 33 to 24. A similar amendment providing that no part of the funds appropriated should be used for carrying packages above 50 pounds in weight, which was designed to escape the parliamentary pitfall of a point of order, was rejected by a vote of 28 to 27. The fight then narrowed down to an amendment to limit the weight of packages that may be carried on star or rural delivery routes to 50 pounds, but this failed by a vote of 18 to 31.

FARM LOANS IN NEW YORK.—Facilities for financing small farmers are sought to be provided in two bills introduced by Senator Murtaugh, of Elmira, March 2, following the reading of Governor Glynn's message on rural credits. One follows the recommendation in the Van Tuyl Banking Commission report and the other the plan mapped out by the Governor's advisers. The second bill, which includes all the provisions of the Van Tuyl measure, calls for the incorporation of land banks, capitalized at not less than $1,000,000 each. The banks are to raise money by the issuance of bonds on first mortgages on agricultural land not to exceed 60 per cent. of the value of the land. The amount of bonds which can be issued is limited to twenty times the capitalization of the banks. A system of yearly payments on the principal, in addition to the interest, which will more than satisfy the mortgage, is provided. Governor Glynn approved a system of amortization loans, which would be issued by a large central bank. The Governor would have the central bank issue debentures, to be secured by mortgages placed by savings and loan associations, acting as feeders for a central bank. Existing associations, as well as those to be organized among farmers, would be stockholders in the central bank. Members of all these associations would be allowed the privilege of borrowing money on the long-time amortization plan.

STRANGER: "Did a pedestrian pass this way a few minutes ago?" The Hired Man: "No, sor. I've been right outer this tater patch mor'n a nower, and notter blamed thing has passed, 'cept one solitary man, 'an he was trampin' 'erlong on foot.—Credit Lost.

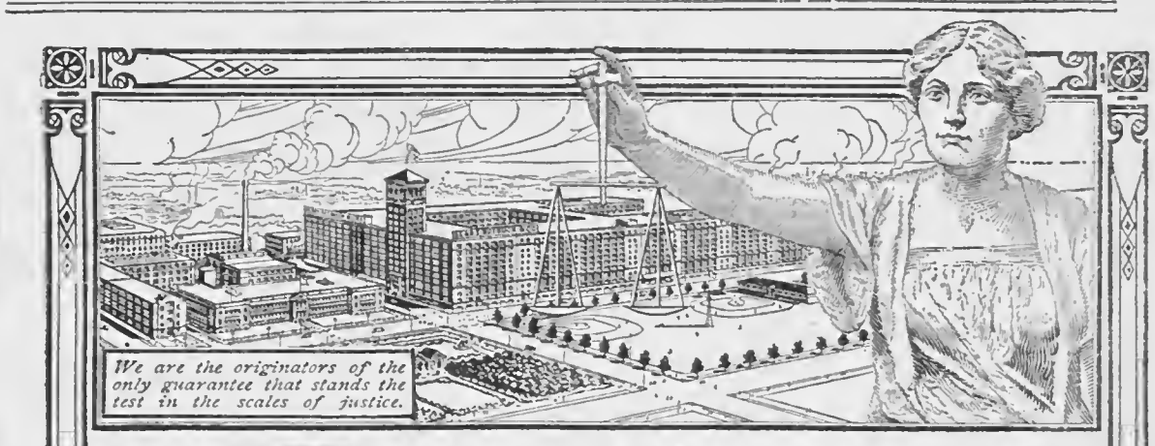
TILE DRAINED LAND IS MORE PRODUCTIVE Earliest and easiest worked. Carries off surplus water; admits air to the soil. Increases the value. Acres of swampy land reclaimed and made fertile. **Jackson's Round Drain Tile** meets every requirement. We also make Sewer Pipe, Red and Fire Brick, Chimney Tops, Encaustic Side Walk Tile, etc. Write for what you want and prices. JOHN H. JACKSON, 89 Third Ave., Albany, N Y.

ROUND TILE



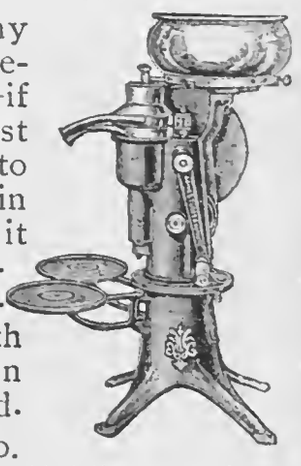
ECONOMY King Cream Separator

Our sanitary loose disc bowl has no slots, crooked tubes or inaccessible corners. The supply tanks are seamless and of our improved no-splash pattern. Every part of the bowl and supply tank and the covers coming into contact with milk are highly polished and tinned and retinned with the best pure block tin.

An ingeniously designed dirt collecting chamber in the bowl cleans and purifies the milk.

These and many other advantages of Economy Cream Separators are fully explained on pages 1225 to 1237 of our new big General Catalog. If you would like additional facts, we have—

THE new Economy King Cream Separator is its own best salesman. Let us send you one on ten weeks' trial. Test it with old milk, cold milk and milk from stripper cows as well as on fresh warm milk. Try the Economy King alongside of any other separator, regardless of name, make or price—compare them for closeness of skimming, ease of running, quick and thorough cleaning and in other essential requirements.



If the Economy King isn't superior to others—if a ten weeks' test don't prove it to be satisfactory in every way, send it back; we will return your money, together with transportation charges you paid.

Prices: 250-lb. capacity, $28.95; 375-lb. capacity, $36.75; 600-lb. capacity, $44.90; 800-lb. capacity, $49.80.

A New Book for Farmers

It not only illustrates and describes our complete line of Economy King Cream Separators, but combines under one cover, complete descriptions and accurate illustrations of our entire line of Plows, Harrows, Cultivators, Spreaders and other farm implements, as well as Buggies, Harness, Gasoline Engines, Farm Tools and many other farm supplies, all sold at worth while prices.

If you would like to have this Separator Catalog, which also combines all these other lines, just write "Send me your Cream Separator Book 66R72" and address

Sears, Roebuck and Co., Chicago

Continuous Hatching.

I read M. B. D.'s answer to P. O. B., page 59. The only part I find right is the number of eggs in the machine, which might exceed 200 and might not. As far as the hatching at different periods in one machine, I know it can be done, as I followed that scheme for two seasons in a 600-egg machine. The hatchings were just as large and birds just as healthy as by the other method, although the trouble was in keeping the eggs clean that were not hatching. The different temperatures M. B. D. talks of amount to less than incubator makers wish us to believe. That idea is no experiment with me. W. J. DOUGAN.

The success which Mr. Dougan reports in continuous hatching in one incubator, using a smaller one to supply it with tested eggs at regular intervals, seemed to me so unusual that I have asked the Poultry Department at Cornell University to give me their opinion of its practicability; and I quote the following from their reply:

"In regard to the question of the continued hatching of eggs in the same machine that have been in incubators in various stages, I may say that we should not, in any case, advocate the doing of this. Primarily, the reason would be that embryos at different stages require different amounts of heat, and also different atmospheric conditions. It is unpractical to maintain the temperature that would be required at all times, as when a few eggs are hatching the temperature will necessarily go a little higher, and might go too high to obtain the desired results from the younger eggs. It certainly is not practical, even in the case of experienced poultrymen, to mix the eggs in various stages of development together. We have occasionally in our cellar put a few batches of eggs in various stages together, but have had considerable difficulty, also, with regard to the moisture needed. In cases where we had two different stages of eggs in the same machine we would have to strike about a fair average. In most cases this would not be satisfactory, or give good results. To inexperienced poultrymen we should not advocate the mixing of eggs; there should be eggs of only one stage of development in the same machine."

An Alabama correspondent, referring to the same matter, says: "When I first ran foul of the incubator I thought it would be a good idea to put in what eggs I had about a week apart and have them come off that way, and I tried it some half dozen times. The first lot put in always gave a satisfactory hatch, but the later additions which were in the machine while the first lot were hatching were failures. They developed perfectly up to a certain point and stopped. On breaking the unhatched eggs, the majority of them had fully developed and nice looking birds in them, but it appears that they lacked the ability to break the shells. The result was invariably the same."

In spite of Mr. Dougan's success, I think that the amateur will do well to go slowly with this method and not risk any very valuable eggs until he has demonstrated his ability to overcome the difficulties which he will be sure to meet.

M. B. D.

Rye for Poultry.

Is there any way that rye can be treated that will make it a safe feed for chickens? I have found that feeding the whole grain is injurious. Will ground rye be a safe feed, or if cooked, or soaked? S. R.

Rye is a suitable food for poultry if prepared so that they will eat it. The hard whole grain does not appear to be palatable to most hens and it would probably be better to grind it and make it a part of their mash. If they will eat it cooked or soaked, I know of no reason why it should not be fed in either of these ways. Rye is very similar to oats in nutritive value, and while I have never had occasion to feed it, I should not hesitate to do so if I had it on hand.

M. B. D.

Blood Spots in Eggs.

Will you tell me what makes blood spots in the eggs? My hens seem perfectly healthy. I use the Corning system of feeding. W. J. E.

Blood spots in eggs are caused by hemorrhages into the oviduct from some of the small blood vessels supplying that organ. These hemorrhages cause small blood clots, which are included within the shell as the egg is formed. These hemorrhages are supposed to be caused by over-feeding on stimulating food, over-fatness, or a weakness in the blood vessel walls. They will appear occasionally under any care, but if they become numerous it will be well to reduce the amount of meat or other stimulating food and give more green stuff. The fowls should be made to exercise as much as possible and not be allowed to become over fat.

M. B. D.

Feeding Poultry Offal.

Some time ago I noticed the advice to feed the waste from dressing fowls to the live poultry. I believe this is poor advice to give anyone, for two reasons: If there is any trace of disease, as roup or colds in the slaughtered fowls, the feeding of these wastes will tend to spread such trouble all through the flock. Second, I believe it has a tendency to create a cannibalistic craving among the live stock. A few years ago I had charge of a flock, and it seemed impossible to keep them free from roupy colds. All this time they were being fed green bone, and the chicken wastes were ground up with this. At last I cut out the chicken offal, burning it up clean, heads, legs and entrails, and within a month a decided improvement was noted and eventually we were able to have a flock apparently all clear. C. J. B.

It is true that there would be a certain amount of danger in feeding poultry offal to hens, unless great pains were taken to see that only offal from healthy fowls was used. Roup, tuberculosis, and various intestinal diseases might be so spread. This danger might be avoided by cooking the offal, but it is probably a better disposition of this waste to burn or bury it. M. B. D.

Securing Profits in Poultry.

I wish to learn how to make more money out of my poultry. I should like to know about feeding and care of flocks in 400 lots, also about mating.

Newburg, N. Y. W. W. M.

The feeding and care of large flocks of poultry, and the principles of mating, are subjects which could not be adequately treated in less space than a good sized volume would afford. With the exception of rearing, in fact, they cover the whole ground of poultry culture. It could hardly be expected that we could cover that amount of ground in the limited space which these columns afford, but we shall be very glad to discuss any particular points in the care of poultry, or any problems which confront our readers. There are many books published which attempt to cover the ground of poultry culture, and of these, "The Business Hen," published by The Rural Publishing Co., offers as practical and helpful discussions of the subject as any single volume with which I am acquainted.

PRODUCTS, PRICES AND TRADE.

Wholesale milk prices are unchanged, the storm having held up supplies so that the expected one-fourth cent drop has not taken place. A large amount of business is covered by $1.81 to $1.71. Restaurants using one to two cans pay five cents per quart.

*

The slight advance noted in butter prices is the result of the snow blockade rather than brisk trade. Business is dull except in the top grades of fresh and storage creamery, the latter going mainly at 29 to 30 cents, and current receipts about two cents more. Very little State dairy good enough to bring the top price, 31 cents.

*

The egg market is very unsettled. There are plenty of eggs on the way, and it is probable that prices will drop too or three cents within a short time, settling at 30 to 32 for fair to choice white and under 30 for brown. Duck eggs are unusually high, whites bringing 40 to 42 cents. Buyers formerly prejudiced against duck eggs because of their more or less strong, fishy taste, find that the eggs produced under present conditions, where the birds are not allowed access to ponds and mudholes, have no disagreeable flavor.

*

The value of the 1913 California grape crop was $26,875,000, divided as follows: Raisins, $4,875,000; table grapes, $7,000,000; wine, $15,000,000.

*

The cut of logs in Maine will be one-third larger than last year. It is expected that the cut on Moose River will be 58,650,000 feet; Dead River, 30,295,000; East Branch and Main Kennebec, 40,945,000.

*

Last year Arizona produced about 2,000 bales of long staple cotton. Part of it has been sold in London at 23½ cents, spinners finding it equal in quality to the Egyptian cotton of this type.

*

Business was active at the London wool sales, opening March 3, many American buyers being present. Some of the prices were: New England, scoured, 24 to 28; greasy, 16 to 24; South and West Australia, greasy, 16 to 25; Cape of Good Hope, greasy, 15 to 21. Montana leads all wool-producing States in this country, having 4,500,000 sheep, yielding 31,500,000 pounds, worth about $5,477,850.

BUFFALO MARKETS.

Butter is again the cheap article. It retails at 30 to 35 cents for good grades, the highest quotation to the retailer being 33 cents. It is crowding oleomargarine pretty hard of late, as that comes out into the open when it has to and retails in packages at 25 cents. Eggs are a trifle cheaper than butter, dozen for pound, not usually getting up to 35 cents, the retail price running all the way up from 29 cents. The farmer is selling potatoes for 60 cents a bushel. They are worth about 70 cents when they reach the city; the retailer pays 80 cents for them and the consumer 90 cents. The city markets are overcrowded with bananas and the citrus fruits. This trade was formerly left almost entirely to the Italians, but they seldom deliver their sales, so the buyer had a way of turning such fruits over to the other dealers to deliver with home produce bought. At last the home dealer grew tired of this plan and put in the Southern fruits also. The prices asked are generally a little higher than at the Italian stands. Bananas continue to go down, good sound ones now being offered at 8 cents a dozen, with the maximum price 12 cents. Grape fruit is a little higher, three for 25 cents, commonly, with extra large 10 cents each. There is no change in country produce prices, so that when Florida stuff gets here in volume there may even be a small decline. Beets are plenty at eight cents a bunch; carrots and vegetable oyster, five cents; parsnips, 10 cents a two-quart measure; string beans, 25 cents a quart (pound). Spanish onions are five cents each; big yellow turnips same. Celery is in better condition than during the mild weather, and sells at five cents a large stalk or 10 cents for three small ones. Cabbage is high, 8 to 10 cents for small heads. Rochester is sending us hothouse tomatoes at 25 cents a pound and lettuce at five cents a head. Apples are high, running to $6 for best red and $5 for green to the retailer, who seldom sells any good grade for less than $2 a bushel. There are a good many Western apples on sale by the small measure, but prices are not so high accordingly as our own.

JOHN W. CHAMBERLIN.

Good horses and mules, from $75 to $150; milch cows, $40 to $75; year-old steers and heifers, $25 to $30; veal calves, $10 to $15; hogs, per cwt., $8 to $9; butter 25 to 30; butter fat 30; eggs 25; poultry, from 6 to 7 cents; hay, from $10 to $25 per ton; ear corn 75c. to $1 per bushel; wheat 90c. to $1; oats 50 to 60 cents; mill feed $1.50 per hundred. Apples $1.50 per bushel; potatoes $1; clover seed $8 to $10 per bushel; straw $8 to $10 per ton. Feed getting mighty scarce and hard to get, and prices still advancing. A. H.

Dixon, Mo.

Calves $10 to $15; one-year-old, $15 to $20; two-year-old and over, $20 to $30; Milch cows (grade) ($50 to $75; butter, dairy, 28 to 30 cents; creamery, 32; potatoes, 50; wheat 90; oats 45; rye 70; barley 65; hay, loose, $13; baled hay, $16; eggs 30. E. R. H.

Ellsworth, Mich.

Snow came on a few days before Christmas, and it has been good sleighing ever since; a fine Winter for business. There are many portable sawmills running in the country towns, the lumber being shipped by rail to Boston mostly, although some is used in the State. Dairying is booming; a new creamery has just been opened at Wiscasset, and another receiving station will begin operations soon at Freedom village. Many cow-testing associations are being formed. Price paid by creameries is 38 to 40 cents per pound for butter fat, and 45 cents per hundred for skim-milk. Most farmers are now selling their milk. Howard L. Hurd, of Thorndike, received $76.99 for the milk of three Holstein cows for the month of December. Milk was sold to D. Whiting & Co.'s local creamery. Cows range in price from $35 to $125. Potatoes 60 cents; butter 30; eggs 30; corn $1.65; bran $1.40; cottonseed meal $1.75 at local stores. Cattle are wintering well; the hay is of very nice quality. Grass was about two weeks later than common years last Summer. Most farmers begun about the same time as ever, consequently they secured the hay in a greener condition than usual. There are complaints that hens are not laying many eggs. Veal calves are in good demand; some skim-milk calves 10 weeks old have been sold to local dealers at from $12 to $15. There seems to be a great decrease in the number of swine on the farms, although pork brings nearly twice as much as it did in those years when every farmer had hogs to sell. Very few cattle are being raised for beef. Farmers are keeping all the cattle they can feed, but they are mostly cows and heifers. Beef is very high in price, but still farmers think that dairying pays best. Large quantities of Western grain are being bought and consumed on the farms. Porter & Cooper are running a portable sawmill in the town of Montville. For teaming, hauling logs, supplies, etc., they use oxen, having 10 pairs of large Whitefaces. They say they beat horses in cost of operations.

Thorndike, Me. R. W. H.

Live cattle, five to 6 cents per pound; choice, seven cents. Dairy cows, choice, $50 to $70; live hogs, $8.25 per 100, fat; lowest price cost, Fall $7; sheep three to six cents per pound. Clover seed, $8 per bushel. Apples last Fall 40 to 60 cents; $2 to $2.50 per barrel; pears $2 to $2.50 per barrel; peaches $1.50 to $2 and scarce. Average price last Summer for butter, about 25; eggs, 20 cents. J. W. B.

Eau Claire, Mich.

Wheat 89; rye 57; oats 37; beans, white, $1.60; red, $2.25; barley $1.25 per cwt.; peas $1 bushel buckwheat $1.25 per cwt.; corn 30 cents basket of 35 ears. Hogs $8.10; cattle $5 to $6. Hay $10 to $11.50 per ton. Butter, f. o. b., 28; milk at cheese factory $1.80. Fruit was all shipped out last Fall. Potatoes 45 cents and quite liberal supply in storage. E. F. B.

Evart, Mich.

Breeding for Egg Laying.

Last Spring I bought seven hens and a male, the result of 32 years breeding of barnyard fowls. They are bred to lay and remain true to their type. How can I breed them and keep them up to their standard? L. H. K.

Connecticut.

You seem to have a flock of purebred mongrels that are making good and furnishing considerable evidence that inbreeding is not as destructive of physical vigor as most people think. So long as these fowls have not been consistently bred to any particular type, you can hardly claim the honor of a new variety for them. They started as mongrels and are still mongrels. If you wish to improve them without introducing any new blood, you can do so by a process of continuous selection, breeding only from those that most nearly approach the type you have in mind. Breed from the largest to increase size, and from the best layers to increase egg production. To find the best layers you will have to trapnest. Never use a weak, defective, fowl of either sex in your breeding pens; by so doing you will obtain the deleterious effects of inbreeding. Prolificacy is now supposed to be transmitted through the male sex; so use sons of your best layers to head your pens.

Greatest Cream Separator Offer

Self balancing, overhead bowl with steel ball bearings. Cannot vibrate. Cast iron bowl chamber lined with white bath-tub enamel. Greatest skimming efficiency. Easiest to clean. Wonderfully easy to operate.

World's Grand Prize Winner

Genuine Imported Melotte

The Melotte—the wonderful imported French-Belgian Melotte—the world's grand prize winning cream separator, now offered to any responsible American farmer on the first bona fide free trial, no-money-down offer ever made on any separator, and at the same price you would pay in Belgium, plus only $1.75 for water freight.

All other who have pretended to offer you a free trial have taken care to get something out of you first. But we don't want anything.

The Melotte, introduced only one year ago, has swept the country. And now the duty is off—the Melotte comes in free. **You win!**

Duty Free Save $15.25

You win on this tariff reduction. The Melotte—the wonderful imported French-Belgian cream separator—the prize winner all over Europe—now offered at an unheard of price in America. **The duty is cut right off. You get the full benefit.** Save $15.25.

Not a Penny Down —30 Days Free Trial

Your simple word that you would like to see this cream separator in your own barn or dairy house brings it to you instantly. We don't want a cent of your money. We give you a free trial that IS a free trial in every sense of the word. No C. O. D.—no lease nor mortgage. Watch your profits go up. Watch the increase of the amount of cream, then, if you do not believe that you ought to have a cream separator, just send it back at our expense. If you decide you want the Melotte, keep it on extremely easy

Monthly Payments

These monthly payments are so small that you will hardly notice them. You only pay out of your increased profits. You don't need to be without a cream separator when you can have the separator right in your dairy house while you are paying for it. In reality you do not pay for it at all. It pays for itself.

Send Today for the Great FREE BOOK!

Place your name and address on the coupon, cut it out, and mail at once. Then we will send you our great free book, "Profitable Dairying," telling you everything about cows and dairying, how to make cows twice as valuable as they are now, and how to make more money than ever before out of them. This book is written by two of the best known dairy scientists in the country. We will also send our handsome free catalog, describing the **wonderful Melotte,** and details of this wonderful Free Duty, No-Money-Down, Free Trial Offer.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

An Average Ration.

Will you give me a balanced ration with clover hay for roughage and with no silage (have good straw and mixed hay)? Also would like a balanced ration for a three-year-old heifer (just freshened), with the same roughage. She has never had grain feed, but has been eating roots, clover hay and silage.
Maine. M. H.

Not knowing what kinds of feed are available to you the best I can do is to give an average ration. I would suggest two pounds distillers' dried grains, two pounds cornmeal and one pound oil meal. In case you cannot get the distillers' grains you may substitute brewers' grains or bran. Cotton-seed meal may be substituted for oil meal, if your cows are fresh, or not soon due to freshen. The above ration will also be good for the heifer, but if she has not had grain begin with less than the usual amount, and increase gradually for a week. In ordinary cases give one pound of grain to 3½ to four pounds of milk.
C. L. M.

Dairy Rations.

Will you give me a grain ration for milch cows? I am feeding cornstalks and clover hay. I can purchase cornmeal at $30 per ton, union and distillers' grain, $33; bran, $26; oil and cotton-seed meal, $34; corn and oats, $30. Will you tell me what sort of a grain ration to give a cow due to freshen the middle of April, that is now giving from 18 to 20 pounds of milk a day? I wish to have her go dry about six weeks. S. W. M.
New York.

A ration composed of two pounds distillers' dried grains, two pounds corn and oats, one pound linseed oil meal and one pound cotton-seed meal is a good one for milch cows. Omit the cotton-seed meal for cows soon to freshen. Feed one pound of grain to 3½ or four pounds of milk. In case you wish to dry off this cow give no grain at all for a few days. After the milk has mostly stopped give two pounds bran and one pound corn and oats daily, or if you wish her to improve more rapidly in flesh increase the amount of grain. C. L. M.

Feeding a Brood Sow.

Will you give me a ration for a sow under the following conditions? Chester White, 12 months old, bred January 22, kept in barn cellar, pen 6x10, dirt floor, raised platform at one end for dry bed. She was raised in woods last Summer and fed "farm slops" with about four quarts a day bran mash. She looks well, and promises a good breeder. I want to bring her and possible family in good shape. Will you suggest a good ration?
Massachusetts. C. H. C.

Breeding sows require a good nourishing ration without too much fattening feed, and should be given a fair amount of exercise every day. Any ration that will accomplish the desired results at a moderate cost would be called a good one. If you can get skim-milk or table refuse you will find either one a great help. In the absence of both of these waste products you could feed a mixture of four parts wheat bran, four parts wheat middlings and one part ground barley made into a thin slop with warm water in Winter and cold water in Summer and fed three times a day. Care should be taken not to over-feed to such an extent as to produce an over-fat condition of sow. C. S. G.

Rations for Cows and Pigs.

1. Will you give me a good ration for milch cows? I have Alfalfa hay and corn silage, but have to buy grain. 2. I would also like a good ration for growing pigs; I have lots of mangels and Winter wheat. A. G. W.

1. A mixture of two pounds wheat bran, one pound cornmeal and one pound cottonseed meal, together with Alfalfa hay and silage, should make an excellent ration for milk production; one pound of the grain mixture to four or five pounds of milk produced should be fed. 2. For the pigs three pounds of wheat meal to one pound of oil meal, with what mangels they will eat, should give a good growth. Wheat meal and cornmeal are similar in value in pig feeding, wheat being somewhat richer in protein than corn. C. L. M.

Wart; Ration for Dainty Calf.

I have a calf that is nine months old and it has a wart under its eye; it is about the size of a small chestnut. Advise me what to do to take it off. 2. I have a calf that is nearly a year old, and it has always been dainty. I have been feeding it straw and hay and three quarts of grain a day composed as follows: Two parts mixed feed, two parts ground oats, 1½ part cornmeal and a little linseed meal. Will you advise me how to feed calf and also to improve its appetite? M. F. S.

1. If you will rub this wart daily with castor oil it will in all probability disappear in a short time.

2. The ration you are feeding ought, on general principles, to give good results. If you find some kind of grain which the calf particularly relishes increase that kind of grain. Stock molasses, thinned with hot water and sprinkled over the roughage, would probably help some. A few roots or succulent feed will improve her appetite.
C. L. M.

Dairy Ration.

Will you give your opinion of the ration I am feeding? My cows are grade Holsteins, giving from 10 to 15 quarts of milk per day. For roughage I have cornstalks, hay, mostly Timothy and oats on the straw. I feed each cow daily eight quarts mixed grain consisting of two quarts gluten and the remainder bran and middlings and in addition to this one quart of cornmeal. Bran and middlings cost $1.45 per cwt.; cornmeal $1.55; gluten $1.60; can obtain cotton-seed meal for $1.80. A. B. R.

You are feeding a very good ration except that it contains no succulence. If you cannot get dried beet pulp or silage you should feed at least one pound of old process oil meal per day to each cow in full flow of milk. This should take the place of an equal amount of middlings by weight. C. S. G.

Shrink in Milk.

I commenced feeding silage the first day of February, not having enough to begin feeding earlier to feed out to grass. Since beginning cows have been giving less milk every day, and up to the present time they have fallen off a can. I am feeding the following: one ton brewer's grains, one-half ton bran, one-half ton No. 2 middlings, one-half ton cotton-seed meal. They are getting four quarts of the above mixture to the cow and a bushel of silage, also one pint of cotton-seed meal on the silage. A. B. C.

A large part of the decreased quantity of milk which your cows are giving is due to the sudden change of feed which you made. Any change in feeding should be made very gradually, extending over a period of at least two weeks for such a radical change as you made. After your cows become accustomed to the new ration they will gradually resume nearly their normal flow but this may take a month or more. The middlings you are feeding should be gradually discontinued and cornmeal substituted. If you will make this change during the next week or two and then be very careful not to make any other changes, but feed steadily according to the requirements of each cow, you will have no further trouble.
C. S. G.

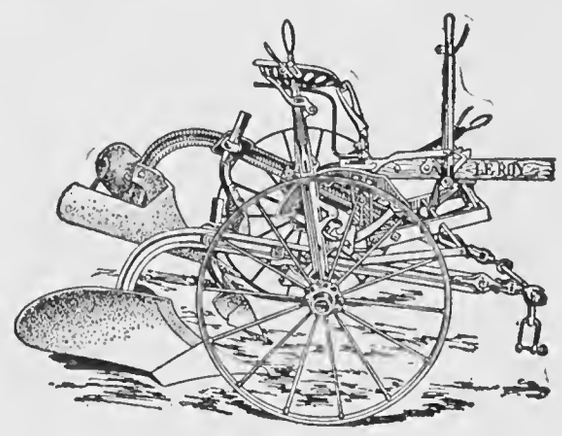
Results Are What Count.
What One Farmer Did With a Light Draft Le Roy Reversible Sulky Plow. Why Not You?
Le Roy Plow Co.,
Le Roy, N. Y.
Gentlemen:—The two-way Reversible Sulky Plow I purchased from you last spring has turned out to be a most profitable investment and the best tool I have on the farm.
I figure the plow has paid for itself already just through the extra cost of fitting up the dead furrows had I used a one way plow.
It plowed 25 acres of stubble for beans, 20 acres of hard stony ground for wheat, 20 acres of old sod which had not been plowed for years, giving no trouble at all and without buying a single extra point. The points that came with the plow were not changed for the entire distance.



MANUFACTURED BY
The Le Roy Plow Co.
LeRoy, N. Y., U. S. A.
The other parts of the plow are as good as new. My boy did most of the plowing and came in at night just as fresh as he went out in the morning.
It is also easy on the horses for I never have to rest them. I figure it saved 455 miles of walking. I hope you sell a lot of them. Yours truly,
Fort Hill, N. Y., Dec. 12, 1913. John H. Parmelee.
The Le Roy handles just as easily in small fields as large and will turn the same sized furrow as any other with much less horse power.
Every farmer likes the **LIGHT DRAFT LE ROY**, because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself so quickly and saves walking 7 miles to the acre.
The Le Roy is guaranteed to do better work than any other reversible sulky plow made. Ask your dealer for a trial or write us.
We are not in a Trust or Combine, but are a strong Independent Company.
LE ROY PLOW CO., LE ROY, N. Y.

ACME ROTARY CORN PLANTER $1.75

ACME POTATO PLANTER $1.00
3 or 5?
A thumb-screw regulates the number of seeds without changing disks. Double coil springs on the trip lever give this rotary planter the snappy action of a pistol.
Balance and handiness—for either hand—come from hanging the 2-quart seed hopper in the center.
ACME
Corn and Potato
PLANTERS
Don't furrow out for potatoes, break your back dropping them and then still have them to cover. Walk along with an Acme Hand Potato Planter and plant them in level ground, regularly, at even depth.
Ask about the Acme Compressed Air Sprayer, with outside pump and never failing nozzle.
"The Acme of Potato Profit" will tell you all about Acme goods if your dealer hasn't them. If there isn't a nearby dealer, we'll supply direct.
350,000 farmers use Acme Planters.

Horses, Mules & Cows Should be CLIPPED
They are healthier and give better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. Horses and mules take on new life and energy when clipped and naturally work better. Clipping the flanks and udders of cows prevents the dropping of filth into the milk. The best and most generally used clipper is the Stewart Ball-Bearing Clipping Machine, the only machine that can be used on horses, mules and cows without change. It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

Price $7.50 Get one from your dealer or send us $2.00 and we will ship C. O. D. for balance. Your money and transportation charges returned if you are not satisfied.

Tanning With the Fur On.

Nearly every year some one asks how to tan skins with fur on and a number of recipes have been printed. I have tried all of them from tanning with acid to salt and alum. I find the following recipe superior to all. Dissolve in hot water separately one-half pound alum, one pound saltpeter, five pounds common salt, two ounces corrosive sublimate. Pour together and add enough water to make two gallons. If the skins are dry they must be soaked in water until quite soft and all the flesh and fat scraped off. Put them in the tanning mixture and leave three weeks where it will not freeze. Take them out, rinse several times in clear water, hang up, beat them with a stick, and when nearly dry work them well by pulling over the edge of a board. There is lots of work in tanning skins in small lots, and your success depends on how much you are willing to do. The amount of materials given will tan 12 or 15 muskrat hides and can be kept from one year to another. Care must be taken so children or animals do not drink it; also be careful that you do not have any cuts on your hands as it is poison. H. B.

Colts With Eruptions.

On page 54 J. H. W., New York, asks what is the matter with his colts. I had the same trouble with some of mine last year, and with others this year. One of Albany's leading veterinarians told me later that the pimples and scabs were caused by a parasite that passes one stage of its existence as a fly, and is liable to attack horses anywhere in pasture, and that spraying during the Summer months would prevent the depositing of eggs, but that either spraying or simply washing would not kill the parasite after it is hatched. In applying the coal tar dip it is necessary to work it well into the hair with a stiff brush, as the parasite burrows into the surface of the skin. Blanketing heavily after the application of the coal tar dip is considered important for the effect of the steam thus generated. Last year the trouble appeared among colts in my home pasture and when the parasites became active in February and the colts began to rub themselves I tried a solution of coal tar dip, simply sponging them, but as I did not then know of the necessity of rubbing it in and blanketing, did not get desired results, and next tried olive oil and sulphur, which gave greater relief from the intense itching from which they were suffering at that time, possibly because it was more thoroughly applied. If I remember aright the trouble came to an end, for that season, during the early part of May. Of the colts and mares kept at home last Summer, but two are infected this year, and those but very slightly, while about a dozen in pasture a few miles away came home in bad shape, two of them literally encrusted from nose and ears to hoofs. I applied cotton seed oil and kerosene, equal parts, in four of the worst cases, and evidently killed the parasites—certainly killed the hair—but I think saved the mares and colts by not repeating the application. Work horses running in pasture and weaning colts that were curried have been free from the pest, probably because the currying and brushing removed the eggs of the fly before they had time to become hatched. J. S. ALBRIGHT.

Otsego County, N. Y., Conditions.

A recent letter by William Kling, from rock-ribbed Schoharie County, speaks well for that county, and Otsego County farmers concede that Mr. Kling has the facts so far as his own county is concerned to warrant his fulsome praise. At the same time Otsego farmers rather resent that part of his letter which criticises Otsego County. The writer who opened up the opportunity which Mr. Kling took advantage of was a Dane who had been in the county less than a year. He spoke of conditions as he found them and probably told the truth, and he wasn't complaining either; but this Dane had bought and wrote of a farm conceded by all who knew, to be about the poorest piece of land in all that region. All counties have once in awhile such a piece of land, and he owns the piece in Otsego County. Somewhat establishing his premises on these two facts, Mr. Kling proceeds very ably to parallel Otsego and Schoharie counties, quite a bit detrimental to Otsego and quite flattering to Schoharie. Now, we are not going to say a word against Schoharie. In some things it stands unique among the rival counties of the Empire State. But we must speak up in defense of Otsego when its front-line position is assailed or called in question; Otsego, with its beautiful valleys traced with water courses and sparkling spring brooks, its sloping hills and its broad level acres of responsive soils, its healthful climate, its great dairies, its County Farm Bureau, its many Granges, its five successful agricultural fairs, its excellent schools and its promising future.

Last year was one clipped at both ends by a hard freeze, late in the Spring and early in the Fall, sufficient to kill growing crops at their beginning and at their end. This experience comes not oftener than once in a generation. It came last year. However, under such unfavorable conditions as existed last year there was grown on a hill farm less than a mile from the farmer who gave Mr. Kling his argument against us and in plain sight of his new home, 267 bushels of potatoes per acre. Within half a mile of the man who furnishes the Government the weather reports from the Butternut Valley, which Mr. Kling cites, a young farmer harvested last year 56 bushels of oats per acre, others went 50 and 55 bushels, and the good corn yields in the Butternut Valley are 50 bushels shelled to the acre; and the corn yield seldom fails. In fact Otsego is called a good corn county. Otsego is one of the best dairying counties in the State, and its farms are selling so low that immigration is coming in here at an astonishing rate. Something like 25 or more Danish families have settled in the towns of Morris and Laurens within a year. They all like it, are satisfied, and say nothing has yet appeared to make them homesick. They are a thrifty class. We invite them to come. Otsego County lands can support them and give them back a good reward for the labor of their hands and brains; and it takes both to farm successfully here, just the same as it does anywhere else, even in rock-ribbed old Schoharie. E. E. C.

"PROFESSOR," inquired Farmer Jimp, "what are you digging for in my backyard?" "I'll pay you well!" shouted the archeologist. "Great discovery! I've found the bones of a prehistoric mammal hitherto unknown!" "Sorry professor; but that's an old wire bustle that I buried over 20 years ago, along with some other junk."—Winnipeg Telegram.

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land, in 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

The Henyard.

TURKEY RAISING.

One great trouble with the turkey industry is that so many would-be turkey raisers will persist in keeping undersized hens for breeding stock, market all the yearlings because they are heavier, and each year breed from pullets. Small, late toms are also kept, and often inbreeding practiced for years in succession. A pair of such turkeys wandered to our place one Spring and they were not larger nor heavier than our Barred Plymouth Rocks. The big white tom promptly drove them off the place. The old rule, "like begets like," holds good with turkeys, and if they are to be improved or even kept as good as at present the breeding stock must be carefully selected.

Old hens, that is, past the first laying season, are best. They lay larger eggs, which hatch stronger poults. Seven such hens mated with a young tom, not akin, and pure blood of whatever breed kept, make ideal breeding stock. All must be of good size and shape and perfect health. Find out the standard weights and select, for breeders those birds which come the nearest to it. By doing this for a few years, one can attain the standard and perhaps above. They must not be allowed to put on fat through the Winter, or the eggs will not hatch, and overfeeding turkeys of any size brings on liver trouble. A mixture of good sound grains, such as barley, oats, wheat and buckwheat, with some corn in cold weather, should be fed twice a day, feeding each time just what they will clean up with a good appetite. They also relish a mash occasionally, made up of wheat bran mixed with cooked vegetables. Clean water and grit are essential.

In warmer climates, turkeys may be left to seek their natural roost, the tree tops, all the year round, but in the long cold Winters of Central New York it seems inhuman to ask them to sleep without shelter from storm and wind. They should have the run of a shed or old hay barn. Roosts should be made of poles about three inches in diameter, placed not too high, and a good bed of straw for them to light on, to save them from injury. A heavy tom is afraid to fly down from a high perch. Give them liberty to go and come at will, but drive them all in at night and shut the door. If the thermometer goes 30 below, or the snow piles up several feet deep, they will sleep better and so will you. Such a building serves the purpose well; it is not too close or warm, gives them plenty of good air, and keeps them dry and protected from the wind. Given this care they will come out in the Spring in fine condition, and begin laying early. In our climate they seldom lay before March, but that is too early to set the eggs. We cannot depend on favorable weather to grow the baby poults before May.

Hen turkeys are very shy about their nesting, and will go quite a distance to hide their nests in the woods or brushy fence corners. This can be prevented by providing them with nests near the buildings. Barrels, turned down on the side, make good ones, each nest furnished with a china nest egg and bed of dry leaves or straw. The eggs will be found there neatly covered with the nest material, and can be carried in for safe keeping. Eggs for hatching should be turned every day and not be allowed to chill; cooling to 40 degrees spoils them for hatching. A hen will lay from 15 to 30 eggs before becoming broody, and can then be "broken up" and made to lay again. Confine her for a day or two in a roomy coop, feed her well and give plenty of water and shells, and she will be laying again in a week.

Turkey hens make the best mothers for the poults; they take them farther afield in search of their natural food, and seem to understand their needs better than a common hen. A turkey will cover 18 or more eggs. There should be plenty of good nest material and both nest and turkey dusted well with a good insect powder. It takes about 28 days for the eggs to incubate. Visit the sitting turkeys often and talk to them so they will become used to their keeper and the sound of her voice before hatching time; then when taken from the nest they will not be frightened and kill or injure the baby poults. The mother turkey must have a coop about three feet square and high enough to permit her to straighten up, the top and back of coop covered with roofing paper to keep it dry and the front slatted and hinged at top. The entire front can be thrown over on top of coop when the hen is given her liberty. In early Spring or wet weather, removable floors are good; they can be taken out and cleaned or discarded entirely when the ground is dry and warm. If floors are not used, sprinkle coal ashes under coop; no moisture will come up through them. The coop should be whitewashed every year and always kept clean and free from lice. The mother turkeys and poults should be dusted with insect powder at least once a week, and carefully watched for any signs of lice, as even one large white louse on the head is almost sure death to a little poult.

Every turkey raiser has his individual method of feeding. My own is the following: Take the poults from the nest as soon as all are hatched and dry, and give them clean water and grit or sifted oyster shells. After a few hours give them a very little wheat bran mixed rather dry with sour milk, sprinkle with a very little red pepper if weather is cold or damp.

Feed this four or five times a day for the first four days, on a clean board, taking it away after they have eaten. On the fifth day begin feeding whole grain, either rolled oats or a good chick feed, at first once a day, gradually working them on to these and later cracked wheat and then whole wheat, buckwheat and oats and some corn. But we keep up the bran feed once every day, mixing it with sour milk if possible. Those who have plenty of sour milk for their turkeys are fortunate; it is an excellent feed and should be kept before them in clean dishes to go to at will.

When the poults are three days old begin cutting onion tops and green dandelions for them. They are very fond of these, and will soon eat more than one cares to cut. Turkeys must never be overfed or pampered; give the hen her liberty when poults are two weeks old. She is wise in turkey lore and will take good care of the little ones. They need lots of exercise and just the kind of food she will find for them. If a sudden shower catches them out in the fields, gather them up in a basket and dry them by the kitchen fire; not one need be lost if they are attended to promptly.

Turkeys, up to the size of pigeons, need constant and thoughtful care, but after they reach that size they are as hardy as one could wish. Plenty of range and one feeding of grain to call them home at night is all they require. This is the method used at Silver Maple Farm for the past six years, with good results. We chose the White Hollands as the breed best suited to our needs. They grow to the size best suited for market birds, 10 to 12 pounds dressed, and of course, show no dark pin-feathers on the carcass. The White Hollands are excellent layers and good mothers, being more domestic in their habits than other breeds of turkeys.

The market has never been overstocked with Thanksgiving turkeys and there is never enough purebred breeding stock and eggs for hatching to supply the demand. The white turkey feathers are very valuable; the quills bring a good price and the fluffs of which there is only a handful on each bird, should every one be treasured. They are much used in millinery and bring a fabulous price. Turkeys are an interesting study, a benefit to the farm and good sure money-makers. All in all, it seems to me they are the best worth while of any poultry raised.

MRS. NILES GROVER.

New York.

The 1914 year-book and catalogue of the American S. C. White Minorca Club is now ready for distribution. The club is in a growing and prosperous condition, having more than doubled in membership, and S. C. White Minorcas are making big strides in gaining public favor. Vastly more S. C. White Minorcas have been exhibited this past Winter than ever before. At the "Palace," Coliseum, Kansas City, Pittsburgh, Washington and many other big shows large classes were exhibited.

363.1 Bushels Potatoes

From One Acre of Massachusetts Land

A. Webster Butler of Brockton, Mass., won the first southern zone prize offered by the Bowker Fertilizer Company for the largest yield of best quality potatoes grown exclusively on Stockbridge Potato Manure. His acre was a "rocky loam" producing about 2 1-2 tons of hay per acre in 1912 on manure. Rows were 36 in. apart and Green Mountains cut to two eyes were planted 14 inches apart. The piece was cultivated five times. The acre was sprayed with Pyrox.

STOCKBRIDGE POTATO MANURE

was applied 2100 lbs. broadcast and 700 lbs. in the drill. No other fertilizer or dressing of any kind was used. The entire crop weighed 21,783 lbs. or 363.1 bushels. His total score including quality points was 589 points, the highest in the southern zone.

Other Winners secured yields ranging from 311.1 bushels to 502.6 bushels in the northern zone, (Me., N. H., Vt.,) and from 183.8 bushels to 363.1 bushels in the southern zone, (Mass., R. I., Conn.)

Send us your name for complete and intructive statement concerning the results of the contest and how these great yields of potatoes were obtained. No other fertilizer than the Stockbridge Potato Manure was used.

BOWKER FERTILIZER COMPANY 43 Chatham St., Boston.

Also Baltimore, Buffalo, Philadelphia and New York.

The question is:

not "How little can I pay for roofing?";

but "How little will it cost me?"

You may pay little and get roofing that soon cracks, crumbles, and leaks; but it *costs less* in the end to use roofing of natural asphalt, which stays waterproof.

Genasco

THE TRINIDAD-LAKE-ASPHALT

Ready Roofing

has the natural oils of Trinidad Lake asphalt sealed in it. They give Genasco life and vigor to resist sun, rain, wind, heat, cold, alkalis, and acids.

It stays weather-proof and saves repair-expense.

Get Genasco and you get the satisfactory answer to your roofing question. The Good Roof Guide Book and samples are free on request. Ask your dealer for Genasco—smooth or mineral surface; several weights. Look for the trademark. THE KANT-LEAK KLEET waterproofs seams without cement and prevents nail-leaks.

The Barber Asphalt Paving Company

INCREASE YOUR EGG YIELD

I HAVE imported direct from Tom Barron, of Catforth, Eng., a pen of S. C. White Leghorn pullets, mated to a Tom Barron imported English cockerel from a 260-egg hen. They are from the same stock as his famous 282-egg pullet, which record was made in America in the International Laying Contest. No better breeding stock can be procured. Settings from this pen will produce bloodlines that will breed layers. PRICES: $8 for 15 eggs; $15 for 30 eggs.

My 1914 importation of Tom Barron English birds includes a number of S. C. White Leghorn cockerels. I have mated them with my best pedigreed laying birds. Hatching eggs from these matings: $3 for 15 eggs, $7.50 for 50, $13 for 100.

Rose-Comb White Leghorns—These birds are raised on my own plant and bred for high egg production. They are mated to strong, vigorous, extra-white, egg-type cockerels. PRICES: $1.50 for 15 eggs, $3.50 for 50, $6 for 100, $50 for 1,000. Rose-Comb day-old chicks from these pens, $7 for 50, $12.50 for 100. Safe arrival guaranteed.

Full-Blood White Wyandottes—Write for prices on hatching eggs and day-old chicks.

Free illustrated catalog, containing prices and matings of high pedigreed breeding birds, sent upon request. Write today.

Co-operation in Selling Heifers.

"It is a good proposition for the farmer who lives away from a city market to raise heifers," Prof. Anderson of the Michigan Agricultural College told the writer not long ago. "The near-city dairyman cannot afford to raise them since he receives high prices for his dairy products." Professor Anderson urged the raising of heifers until they calved, breeding to good bulls, and keeping the heifer calves. He advises rearing the heifer calves and buying more to maintain the number to be sold each year. If good quality stock is produced, the city dairyman will return year after year to replenish his herd. It costs no more to raise a good heifer than a poor one, and possibly less. In the past 15 years the number of cows has decreased while the population has greatly increased, and the city dairyman is searching for good stock, since he cannot afford to raise calves to maturity on his high priced land and intensive methods.

In the Middle West good cows bring better than $100 each, and some well-marked high-grade Holsteins have brought as high as $150 and $175. A near-city dairyman told the writer that he would be willing to pay from $100 to $125 for good young grade stock, and had travelled through the dairy sections of several States, and was able to secure only very ordinary farm stock at $125 the head. He suggested that where farmers secured low prices for their milk each farmer in the neighborhood should raise a half dozen good calves or more each year, so that several carloads could be secured in the community. The high class of buyers go where cattle in carloads may be secured, and are willing to pay good prices. A buyer cannot afford to spend days chasing over a half dozen townships for ordinary stock, when he can go to a dairy section and pick out a carload in much less time. In Ohio, Geauga County is an excellent example of a dairy section attracting buyers for their particular breed. One dairyman told the writer that he had as many as a half a dozen buyers come to his farm in a single day, and that it was almost impossible for him to keep a cow in the barn, the buyers pressed him so vigorously and their prices were so attractive.

"The live stock sale is a success," declared a dairyman, "and I do not see why farmers do not associate in the production of young stock, advertise the sale well, and it will prove a profitable proposition." He is right. Coöperation in the production and sale of live stock is an easy matter, breed from good stock, stick to one breed and then when they are ready to be sold, secure good auctioneering service, advertise well, for advertising is the means of securing buyers, and in view of the demand for dairy cattle there is no question about the venture being an assured success.

An Ohio breeder during the past Summer spent fully a day each week endeavoring to get his neighbors interested in purebred and good grade stock with the view of having later a community stock sale, and advertising it well. He says there will be more money for the community, and he can afford to give his time and leadership to the proposition, for it will mean good money for him later.

WALTER JACK.

Sale of German Hares.

I have been told that a few years ago a number of German hares were brought into New York State and liberated. I would like to get some of these hares to set free here. Could I arrange with some one in New York State to catch the hares and ship them to me? J. V.

Section 177 of the Conservation Law provides that game protected by law shall only be taken in the daytime with a gun fired at arm's length, without rest, unless otherwise specifically permitted. There is no special provision permitting the taking of rabbits except that ferrets may be used when authorized by resolution of the Commission in particular counties, except also that the owners of enclosed lands may cause rabbits to be taken, except by the use of ferrets, in any manner and at any time when such rabbits are injuring property. Under Section 196 the sale of rabbits during the open season is permitted, and rabbits lawfully taken may be transported during the open season in any manner.

J. J. CONNOR,
Counsel to the Conservation Commission.

All The Water You Want

Fresh From the Well Without Storage

You can now have fresh running water in any part of your house, barn or feed lot without a water storage tank. All you need to do is to turn a faucet anywhere and the wonderful Perry FreshWater Pump automatically starts working in well or cistern—giving you fresh, pure water, hot or cold, hard or soft, for kitchen, laundry, toilet, bath and watering stock.

Over 6 Years Old — Perry FRESH WATER System — Over 6000 Sold

This marvelous system brings the greatest of all city comforts—fresh running water—to farm homes. It is easily installed, simple and inexpensive to operate, very durable and requires no special building or change in location of well. See what users say.

These Seven Cows

may all be kept for one year on the product of one acre of land. Think of it! Keeping seven head of cattle for a year from one acre goes a long way towards reducing the cost of milk. *70 tons and 800 pounds of EUREKA CORN* was raised on one acre in 1911, and we believe Eureka Corn can still beat this, but no other kind ever has and we believe never can equal it. Figuring at the rate of 50 pounds of ensilage per day, which is a liberal allowance, this amount will feed seven cows for one year and enough left over for 261 feeds.

EUREKA CORN was introduced by us over 20 years ago. It is a white, smooth dent corn and grows the tallest of any known variety, has the most leaf, and if planted thin will produce ears. It was grown successfully last year in 43 different states. Planting Eureka Corn is as good as an insurance policy; it grows where other kinds fail.

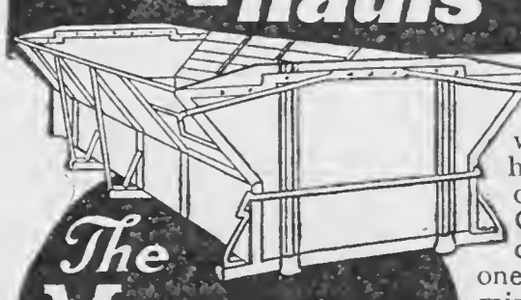
EUREKA CORN
Grows Tallest, Has Most Leaves, Greatest Number of Ears

This corn was planted last year by more successful farmers than any other variety, and it will produce more tons and more dollars worth of good milk-producing feed per acre than any other kind of corn. This has been proven many times over. Why plant corn that will only produce 15 to 25 tons per acre, when you can just as well grow 50 or 60 tons per acre?

Either buy direct of us or some of our agents who have the genuine. Write at once for 1914 catalogue of our wonderful varieties of big yielding corn and seeds.

ROSS BROS. CO. 67 Front St., Worcester, Mass.

One Wagon Bed -hauls everything!



The MELROSE 15 Wagons in One

Think of the pleasure, convenience of doing all your hauling in the same wagon bed. No more back-breaking and heavy lifting, changing wagon beds from one purpose to another. With the Melrose Covertible Wagon on your farm you can change the bed from a grain tight to any one of the other necessary farm uses in two minutes, with no tools but your hands.

30 Days' Trial
Send No Money

All the word arguments in the world can't begin to convince you of the merit of this practical wagon idea. So we say, use this wonderful wagon on your own farm for 30 days—before you send us one cent. Try it out with your own work. Let it sell itself to you. Then after a month's good use decide whether you want to keep it or not. You'll be under no obligations to keep it. We won't urge you.

It is simplicity itself. There are no ratchet springs, complicated gears or intricate cogs to get out of order or cause trouble. Any farm boy old enough to handle a team can make the changes in no time.

Remember, now — we don't want you to send us a penny. Just write — tell us if you want complete wagon with gears or just the convertible wagon bed. The low price will astonish you. So don't hesitate.

Send today without delay for descriptive circular and details of offer. 16

AN International Harvester tractor, Mogul or Titan, reduces the expense of heavy farm work—plowing, disking, harrowing, grubbing, harvesting, and hauling.

To know the remarkable capacity and year-round efficiency of International tractors send for our tractor catalogues. They explain all the features to you—the efficient power starting system, the throttling governor, the dust and grit proof engine, the simple construction, the ease of operating, etc. They tell you how the modern tractor has revolutionized field and barnyard belt and drawbar work—saving time, labor, and money.

I H C tractors are simple and strong. They are built in several styles and all sizes, from 6–12 to 30–60-H. P. operating on kerosene and gasoline. The I H C line also includes all styles of general purpose engines from 1 to 50-H. P.

Write us today for instructive illustrated catalogues of I H C tractors and engines. We will tell you where you may most conveniently see the machines.

Importing Poultry.

I am going to import some poultry from England and several persons tell me that there is some sort of go-between from the steamship to the express company who charges his own price for delivering the stock to the express company. One man had to pay $12 to get a pair of bantams off the ship, another had to pay $4 to get a setting of eggs, another $5 to get some hens. Is this duty that has to be paid to the government or is it a scheme of the steamship company to "soak" the importer? How much would I have to pay on six birds valued at $36 in England?

New York. D. M. H.

The duty on live poultry is one cent per pound, and this in addition to transportation and a small custom house fee is all the expense necessary. Most of the large express companies have foreign departments, handling such shipments from start to finish, and for a person at some distance from the port where the shipment is received it is far better to deal with them than some individual broker, who is likely to add a large slice of extras.

Brooding Chicks in Large Flocks.

Will H. E. Matthews, who writes on page 1288, tell how he constructs his ventilator flue for intake, and flue for ventilator through roof, position of radiators and any details that would enable me to change over house 20x10 for brooding? T. H. M.

Our intake comes from the east and the west ends of the building, and is carried under the hover floor. The radiators are set near the back of the hover, directly over this air pipe. An eight-inch pipe comes up between the two radiators to within four inches of the top. In this way the air is delivered at the warmest part of the hover, and passes out near the floor into the room. This is according to the King system of ventilation. After the air passes from under the hover it rises to the top of the room leaving the heavier carbon dioxide near the floor. The ventilator shaft to remove this foul air should be placed near the south side of the room, beginning within three inches of the floor, and extending three or four feet above the roof. The pipe should be eight inches square. In making use of an old building the heater should be in an adjoining room and on a lower level, so the water will flow to the radiators. An oil heater or the coal heaters designed for 1,000-chick flocks would be cheaper for a single room. The same principles of ventilation will apply, always being careful to take the air in through a pipe coming from a low point, and delivering the air two feet or more above the floor. H. E. MATTHEWS.

Leg Weakness.

I have a pullet that seems weak in the legs; whenever she walks, it is with uncertainty, and after a few steps she squats down, in which position she remains most of the time. Her droppings are mostly white, soft and pasty. I feed the Maine Experiment Station mash, with one part cut Alfalfa added. I am treating her for cholera; am also feeding very scantily with grain. Can you give me any information as to her ailments? C. L. K.

The chief causes of leg weakness in fowls are believed to be rheumatism, from housing in damp, ill-ventilated houses, and overfeeding upon rich, stimulating food, combined with lack of sufficient exercise. The remedy would obviously be the correction of whatever conditions led to the trouble in any given case; with pullets, I should be inclined to think of rheumatism first. M. B. D.

Why Don't the Hens Lay?

"The melancholy days have come, the saddest of the year." Grain is expensive, and eggs are scarce. My neighbor, who has 300 White Leghorns of good breeding, about half of which are pullets, told me yesterday that he was considering whether it would not be best to sell them. He takes good care of his hens, and has a fine-looking flock. They had reached a daily egg production of 57 when the very cold snap of January struck us; they dropped down to 14, and have now, January 28, got back to 31. There has been no lull in the price of feed during this time.

Another neighbor left a salaried position about three years ago and, having some means, purchased a desirable place, with a few acres of land, in town. He is a man of good business judgment, great energy, and a tireless worker. Not wishing to retire from the active labor to which he has been accustomed for a lifetime, he started a poultry plant; 200 Leghorns did exceedingly well for him, so he increased his capacity and now has 200 yearlings and 300 fine pullets. He gives them all his time, cuts green bone, sprouts oats, and works "Harder than I I ever did in my life before—and that's going some"—and as a reward for his labor, and a very considerable investment, is getting 60 to 70 eggs per day. There is no fault to be found with the care; his hens are being intelligently and painstakingly looked after; they are beautiful to look at, and chatter persistently about what they are going to do—in the Spring. They will; but the owner would like to sell his plant. I think of these men, and others, when I read the optimistic ebullitions of a well-known poultryman who is urging his fellow farmers to discard cows and keep hens, and who seductively intimates to tired town workers that a few "units" of poultry, kept upon a back lot, after his plan, will afford a delightful income and take but a few minutes of time.

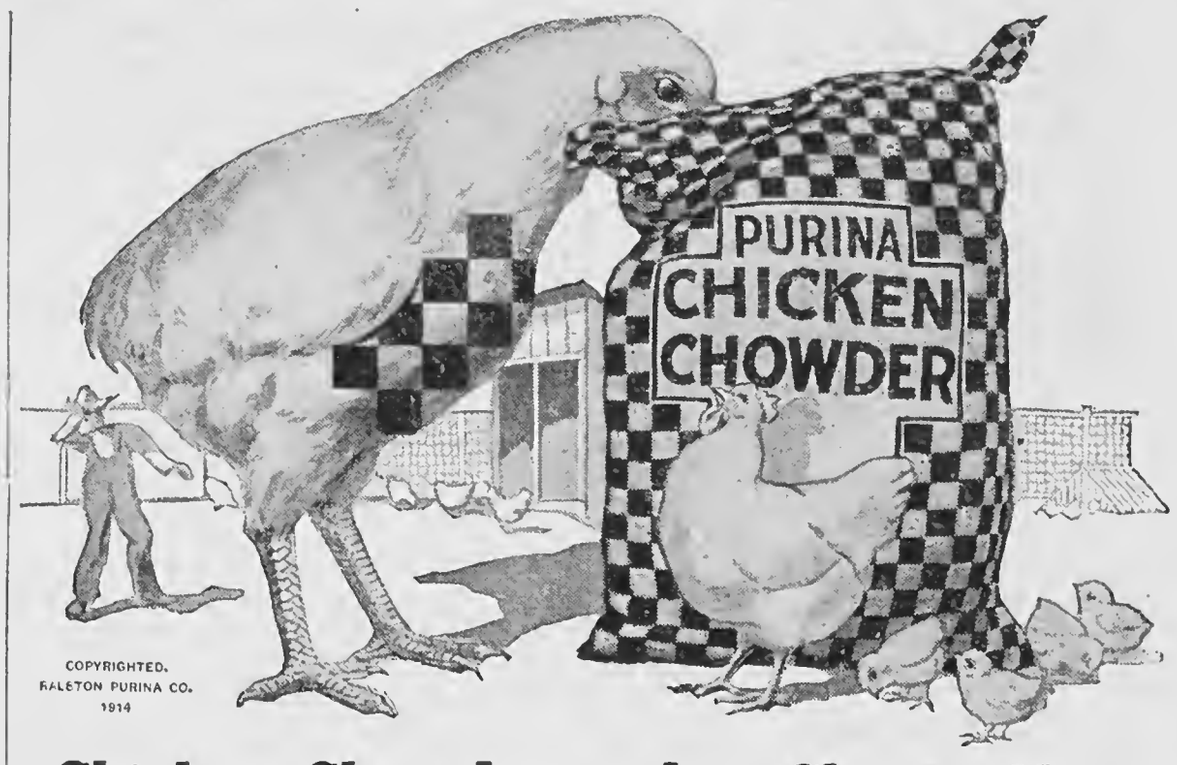
It may be that there is a difference in seasons; the complaint that hens don't lay seems more insistent this year than usual. A late warm Fall gave the pullets a good start, but the sudden onset and persistent zero weather put a crimp into the fair prospects of many a flock. They will recover their stride, but the grain bills mount and egg prices decline while they are recovering. Faith is the foundation of all business, but it must enter into the superstructure as well if one is to stay in the poultry business. There is no need for discouragement in those who have not "plunged." If they have invested wisely, kept their feet upon the ground, declined to put their all into an egg basket and have made the filling of one only a part of their work, the skies will blue again, and with the coming of Spring the hens will seem very fountains of eggs. The downy chicks will twitter their way into our hearts, we shall again believe their fair promises and all our mid-winter gloom will be dispelled. M. B. D.

Vertigo.

What is the matter with one of my hens? It is a Spring chicken and it turns its head around so the bill will point to the roof, eats pretty well when I hold her but will turn round and round when put on the floor and does not try to walk much. Head seems hot and she tries to rub it on floor; head keeps turned and neck also all the time. A. D. W.

These symptoms of vertigo, or dizziness, are supposed to be caused by some brain disturbance, probably often due to intestinal irritation from the presence of worms, or from indigestion. A rational treatment would be a good dose of physic, such as a teaspoonful or two of castor oil, or a couple of grains of calomel, and the subsequent feeding for a few days of soft easily digested food. If the presence of worms is suspected, a teaspoonful of turpentine, mixed with an equal quantity of some bland oil, is indicated.

M. B. D.



Chicken Chowder makes Chesty Chix.

It makes them grow twice as fast. This means large profits, heavy egg production and vigorous chicks that withstand disease. You can't afford to be without this *growing feed* now, any more than you could afford to be without it last winter when you proved that "if Chicken Chowder won't make your hens lay they must be roosters." Feed Chicken Chowder in addition to Purina Chick Feed and double your profits. For sale by leading dealers. Order from your dealer today.

Checkerboard Poultry Book FREE!

For your dealer's name we will send you this 48-page Poultry Book, containing plans of houses, breeding and feeding charts, space for daily egg records, cures of diseases, care of baby chicks, etc. It also contains information about Col. Purina's half price galvanized iron Chick Drinking Fountain (2 for 25c) and more details about his Automatic Chicken Chowder Feeder (50c). Write today.

Col. Purina, Purina Mills, 827 Gratiot Street, St. Louis, Mo.

Dr. J. C. DINMAN, Spring Valley, N. Y.

INT'L EGG-LAYING CONTEST

COLONIAL REDS WIN over every American entry of the American breeds. Our pen of Reds, single comb, beat every American entry of the American breeds, each bird averaged for the year, **194 EGGS.** Official record. We offer **EGGS FOR HATCHING,** from our pedigreed stock that we honestly believe are the strongest-laying lines produced to date. Our mating list will tell you details and prices, and will be sent on application. We promise honorable treatment. We are the breeders that furnish all the birds that the *Youth's Companion* ship out to their subscribers. Shipments made to forty-six States the past year. **COLONIAL FARM, Box O, Temple, New Hampshire**

THE EGG-LAYING CONTEST.

S. C. R. I. Reds come to the front this week, Dr. J. A. Fritchey's pen laying 44. This pen leads all the Reds in the total score also, they having laid 455. The next best S. C. Red record is by Geo. P. Dearborn's pen, 376. White Leghorns take second place for the week, Branford Farm's pen laying 42. F. H. Benton's White P. Rocks, and Merrythought Farm's White Wyandottes tie for third place with scores of 41 each.

Tom Barron's White Wyandottes are 'way behind this week, their score being 31; but their total, 648, is 126 eggs ahead of any other pen. The pen averages show the White Wyandottes far in the lead. Their five pens have laid 2,204, an average per pen of 440.8. The next best average is that of the two pens of R. C. Reds, their average is 274.

Profitable Poultry's pens average 268 per pen. S. C. Reds average 235 per pen. White Leghorns average 221 per pen. This shows that the Wyandottes have laid since this contest began, just about two eggs for every one egg laid by the Leghorns. But wait until next Summer and Fall, and then compare averages.

The Barred Rocks have averaged 194; the Buff Wyandottes 180.75. Daniel Hines' two pens of Dunghills averaged 180. White P. Rocks averaged 170. Buff P. Rocks averaged 154. Below are some of the records:

Pulping Roots for Hens.

The best thing to make turnips, potatoes and beets into a pulp is to run them through an apple grater run about one-half speed, with the knives set rather coarse. The apple grater is the implement used in cider making plan. I bought a second-hand one for $1. My man claims he has put 15 bushels of turnips through in 10 minutes. Cattle do not get tired of turnips if they are made into a coarse pulp. J. M.

New Holland, Pa.

PUBLISHER'S DESK

As Spring approaches the "horse gyp" will be on the lookout for his usual harvest—his advertisements are in some of the daily papers. It is to the credit of a few of the New York city dailies that this class of dealers cannot buy advertising space in their columns. You will recognize these "horse gyps" by the earmarks on their advertisements. To allay suspicion they advertise as "Express Company's Stables," "Brewery Stable," "Railroad Stables," "Ice Company Stables," etc. The advertisements give the impression that good horses are almost given away in New York city and a 30-day trial allowed. The more liberal the offers the greater need there is to beware of the advertiser. We have exposed their methods often and we hope no reader of THE R. N.-Y. will become a victim of the "horse gyps" or "automobiles gyps" this season.

There is a man travelling through here claiming to represent, or rather own, David Rising Seed Co., Easton, Pa., selling potatoes at $3 per bushel, seed corn $6 per bushel, etc. He wants the money at once, or before he sends the goods. Is there such a firm, and reliable, or is it a humbug? I did not bite, and do not intend to; but some of my neighbors ordered goods for $50 to $100. He claims to own farms in different States, and raised 4,000 bushels of potatoes.
Pennsylvania. O. F. B.

We do not know the David Rising Seed Co., and we fail to find any such concern listed in the reference books open to us. It is a pretty safe rule to avoid agents going about the country telling big stories about seeds, plants, or trees, and selling them at fabulous prices. You have no assurance that the seeds offered by such agents are reliable, and there is no question that you can buy better seeds from the most reliable houses in the business at less than half the cost. Our contention is that farmers cannot afford to take chances on planting such seeds if they cost nothing.

Can you advise me as to the reliability of Robert J. Gunson & Co., seed growers and importers, Rochester, N. Y.?
New York. N. H. B.

These agency houses invariably have some new and wonderful variety of oats, corn, etc., which no one ever heard of before, We know of no variety of seed introduced by these agency seed houses that is being generally grown at the present time. But from year to year farmers are asked to pay extravagant prices for unknown varieties by these agents. It is important in the purchasing of seeds to entrust your order only to houses with an established reputation for reliability and fair dealing. This is one of the several concerns in Rochester selling seeds on the agency system. From the reports that come to us of the stories told by these seed agents, they have the nursery agents beat a mile when it comes to handing out the pure unadulterated variety of "guff."

Claude J. Van Slyke, president of the New York Central Realty Company, and James A. Robinson, treasurer of that concern, pleaded guilty before Judge Hollister in the United States District Court to-day of using the mails to defraud in the sale of $500,000 of the company's worthless bonds. William Cooper, organizer of the concern and its first president, was indicted with Van Slyke and Robinson in August, 1912, by the Federal Grand Jury. The company sold $470,000 worth of 6 per cent. gold bonds to 800 investors.

It was further revealed that the property owned by the company was worth $35,000 and that it was mortgaged to the Windsor Trust Company for $498,000. The running expenses of the concern, it is alleged, amounted to $92,000, chiefly because of the high salaries paid to its officers. Cooper, it is said, got $12,000 per annum and Van Slyke $4,500 a year as secretary and $10,000 as president of the company. Robinson got $7,500 as treasurer and $6,000 in commissions. A loan of $67,000 was contracted at one time from Bloomingdale Brothers and of this it is alleged that $8,000 went in the payment of commissions. In 1909, it is alleged, it bought a tract of land near Providence, R. I., and another near Rye, N. Y., for $5,000 cash and $10,000 in the bonds of the company. The title to this property was taken in the name of the Tuckahoe Lime & Lumber Company, another subsidiary, and later entered on the New York Central Company's books as worth $1,000,000. Cooper was voted a bonus of $200,000 for the acquisition of this land. The company also acquired title to a tract in the Hackensack meadows for $1,500 and mortgaged it for $350,000 in 1910. All these transactions were duly embodied in the company's reports to its stockholders, purporting to show that the concern's assets amounted to $1,856,988.—Local Paper.

I wonder whether readers see the points of similarity in all these schemes? Note an original company and two subsidiary companies; land mortgaged for 25 times its value in one case and 233 times its value in another case; big salaries and commissions to the promoters, and a responsible trust company willing to lend its name by certifying to the mortgages without knowing or caring about the value of the mortgages. Some of the promoters will probably go to jail for a few months, but precious little good that will do the people who have lost their money. This is a very small edition of the E. G. Lewis scheme at St. Louis, but except as to size and details the schemes were similar. In that case William Redfield, now Secretary of Commerce, regretted, so he said, that he was not in on the deal. He did not say whether he would have preferred to be in as a promoter or as a sucker. But if the latter, he certainly missed another opportunity here at home. Mr. Redfield and Representatives Ashbrook of Ohio and McCoy of New Jersey, gave more encouragement to crooks than any other three men that we have known in public life. They kept Lewis out of jail, which seemed to be their object at the time, but the courts go on convicting an occasional Lewis imitator. We regret to see Mr. Redfield lose so many similar opportunities. If he has no preference for the promoter end of the game, he certainly ought to be able to get on some of the sucker lists.

On June 21, 1913, we sent money order for $3.05 to the Fruitman and Gardener of Mt. Vernon, Iowa, for one year's subscription, 1913-1914, to "The Outlook" and "Fruitman and Gardener," at the latter's club rates. In August we received a letter from The Outlook requesting our subscription. We wrote them both explaining the matter, but received no reply from the Fruitman and Gardener. The postmaster traced and advised us the check was cashed by the F. & G. at Mt. Vernon, June 26, 1913. We wrote them to that effect, but no reply. The Outlook has no subscription credited to us on the books, and the question is who has the money. The F. & G. is evidently still on earth, for we receive it. W. F. J.
Michigan.

We wrote The Outlook people and received the following letter:

We have your letter of January 27 in which you ask us if we received an order last June from the "Fruitman and Gardener" for a subscription to "The Outlook" in the name of W. F. J. We have not received this remittance.

After writing four letters to the "Fruitman and Gardener" we received the following reply on January 30:

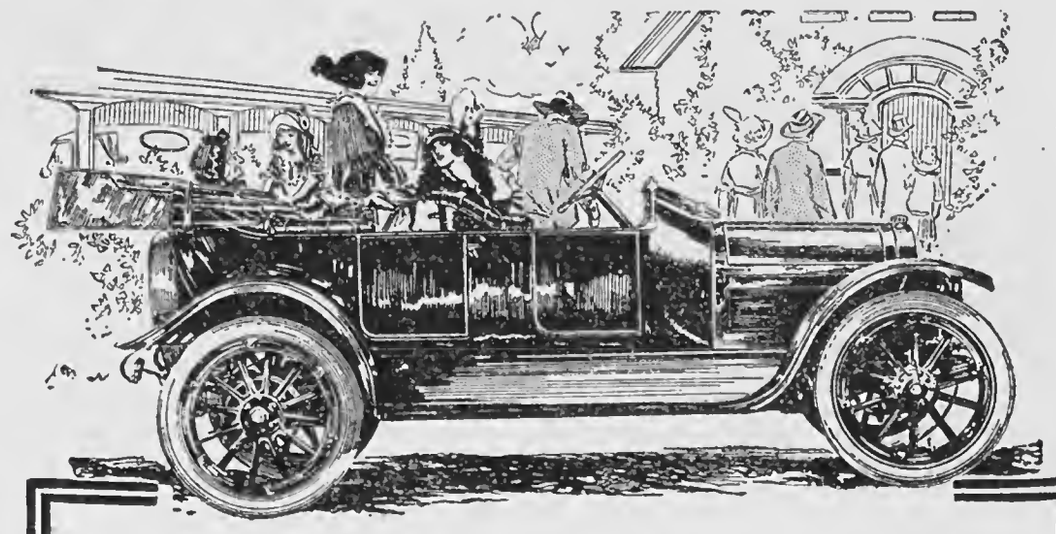
Your letters to us go in the waste basket. Consequently they are wholly and entirely a waste of stamps. If anyone had any complaint in regard to treatment received by us this is the place for them to leave it. LLOYD MCCUTCHEON.

The publisher of Fruitman and Gardener ignores the fact that W. F. J. did write him and could get no reply. This treatment of a customer may be very gratifying to a self-complacent publisher, but if our observation is worth anything it is not a promise of success in the field of periodical journalism. J. J. D.

Mustard for Hens.

Of what use is French mustard, dry, for hens? In what quantity would you use it and with what? C. H. B.
Cold Spring Harbor, N. H.

I would not use mustard, or other condiments, in any quantity, as a poultry food or tonic. It is a common practice to add mustard or pepper to foods with the idea that they "stimulate" the digestive organs of fowls. These condiments contain essential oils which are irritating to the mucous surfaces with which they come in contact and produce a sensation of warmth, and if too long continued, of pain; but irritation is not stimulation, and does not promote the digestion and assimilation of food, without which eggs cannot be made or body warmth promoted. As condiments to stimulate the jaded palates of humans who have so dulled their organs of taste by long continued use of highly seasoned foods that they cannot appreciate a mild flavor, they are all right, but don't inflict them upon hens whose simple tastes do not call for French dressings. M. B. D.



For Value Received . . . $1785

A full forty-five horse power motor built in the Apperson Way—T-Head cylinders cast separately. Oiling and cooling systems that conserve the power of the engine and get it to the rear wheels—*not* into the muffler. A patented contracting band clutch that won't slip, won't grab, and needs no attention.

These are a few of the *real* merits. The one-hundred-cents-on-the-dollar proved-efficient values in every

Apperson "Jack Rabbit" Four Forty-five
"The Wizard of the Hills"

Our overhead expense is low. Every officer in the company holds an active position. There is no "deadwood." No fancy salaries paid to do-nothing officers and dummy directors.

Our production is relatively small. Never will we permit it to reach the point where quantity interferes with quality. The efforts of a know-how organization are concentrated on a *limited* number of cars—all most important factors in the right manufacture of a service-giving car at this within-reach-and-reason price of $1785.00.

The illustration above gives but a faint idea of the car's graceful beauty. Get in touch with our distributor nearest you and *see* it. Prove for yourself by actual road work its power, speed, and smooth running qualities—that in it there are units of value to the *full amount of the purchase price.* Or write us direct for Complete Art Catalog showing as well the Light Four Forty-five at $1600.00; the Six Forty-five-fifty-eight at $2200.00.

Good Concrete Work

The quality of all concrete work is largely dependent upon the quality of the cement. The standard ingredients—clean sharp sand, gravel and water—need no special care in selecting. But because of the importance of cement, you should be most careful in its choice.

To be sure of good concrete work—select

LEHIGH PORTLAND CEMENT

Good quality in cement is determined by its tensile strength. We endow "Lehigh"—by our scientific process—with a tensile strength that is unusually high.

This tensile strength in Lehigh increases with age. It gives to the structure greater power as time goes on and forestalls deterioration.

Better write for "The Modern Farmer," our book that explains Lehigh quality and shows how to build concrete foundations and other concrete structures.

Lehigh Portland Cement Co.
401 Young Bldg., Allentown, Pa.
104 Consumers Bldg., Chicago, Ill.

Build concrete foundations for house, barn or corncribs. They last forever, withstand greatest strain and are fireproof and ratproof.

Limberneck.

On page 164 J. O. G. gives as a remedy for limber-neck the ax. This is not necessary. In August of last year I found three fine Leghorns with this peculiar trouble. One was so bad she lay with eyes shut and neck stretched out, and paid no attention to me. I carried them all to the barn and gave with an oil can such as is used for oiling machinery, a tablespoonful of castor oil to each bird. They all lived and in spite of husband's assertion that the remedy would make anything want to die, were lively and ready to eat the following morning. MRS. JAMES LAMPMAN.

White Wyandotte Shape.

In looking for a cockerel to head one of my yards, asking for a "utility" bird with an egg record back of him, two of the five present said they found it hard to keep their egg laying strains to standard requirements as to shape of body and size of comb. Mrs. Flora A. Haynes of Idaho, whose record we greatly admire, also writes "My flock has the faults (?) you speak of. They are too long-bodied (large combs too), as are all heavy laying White Wyandottes that I have seen pictures of. The English White Wyandottes that laid heavier than mine at Storrs show in their pictures a more pronounced long body than mine * * * Therefore I believe it is useless to look for extra heavy layers and show birds in the same individual." What say Cosgrove and others?

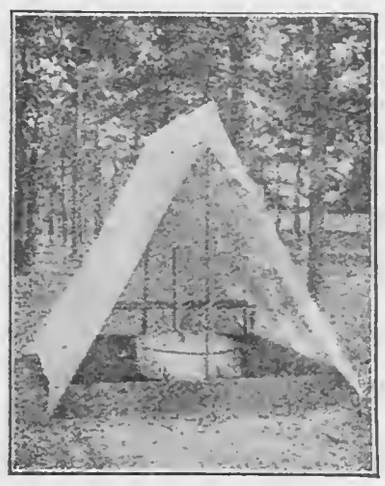
S. T. W.

I long ago made up my mind that the fanciers were ruining the White Wyandotte from a utility standpoint, by their fad of breeding for a short body. While it was true that some of the short-bodied birds laid very well, it would be wonderful if none did, yet it was true that the longer-bodied birds as a rule were the better layers. Several years ago Prof. C. K. Graham, then at head of the poultry department at Storrs College, gave some lectures illustrated with lantern slides of 200-egg hens of different breeds. In every instance the picture showed a very long-bodied bird, no matter what the breed was. I know a man who had bred his Wyandottes until they just suited the poultry show judges; he won at Springfield show in a large class of Wyandottes. I met him a year or two afterward in Hartford and inquired if he was still breeding Wyandottes? "No," he said, "I got them so they would suit the judges, but they wouldn't lay eggs, and what few they did lay wouldn't hatch, so I got rid of all of them." I like to see a hen with a long body, legs wide apart and plenty of abdomen; in short I want hens to have plenty of room in their egg factory.

GEO. A. COSGROVE.

Brooding Chicks in a Tent.

We placed a portable hover in an eight-ounce canvas tent (See Fig. 165) and after warming it up to 95 degrees put under it 100 S. C. White Leghorn chicks about 60 hours old. On the feeding board we sprinkled some fine grit and gave the chicks warmed water in a two-piece drinking fountain. Around the hover we made a circle of one-inch mesh wire netting one foot high. This was to keep the babies from wandering too far away until they got better acquainted with "mother." Next morning they were given their first feed of rolled oats and the fountain was refilled with warmed water after they had eaten. Two and a half hours later they were given some commercial chick food on the feeding board with more grit. We continued feeding alternately every two and a half hours oatmeal and chick food. Second day after the tent was warmed up the wire was removed and chick food was sprinkled in the clover chaff, which had been spread about two inches over all the



TENT FOR CHICKS. Fig. 165.

floor and under the hover. The third day at noon and every day following, they were fed from a dry mash composed as follows: 15 pounds bran, 10 pounds middlings, 10 pounds cornmeal, six pounds sifted meat scraps, two pounds fine granulated charcoal, two pounds bone meal. This they ate from shallow pans.

When one week old they were allowed the run of a portable yard 6x16.

After two weeks this yard was removed, and they had a yard in the orchard 40 feet square. We carried an average temperature of 92 to 95 degrees the first week, reducing gradually to from 88 to 90 the second week, and from 80 to 85 the next two weeks. During the warm part of the day, when the chicks were two weeks old, the lamp was put out. The temperature outside was as low as 32 degrees. On the tenth day one chick died, and also one on the twenty-first day, apparently from eating dried grass in the yard. This left us 98 chicks, which when 28 days old required no more heat. We like the tent for several reasons. The light is so even—no dark corners nor bright sunshine spots for chicks to huddle in instead of going under the hover to warm up. Then there is plenty of fresh air and a tent is easy to change to fresh ground. Also the cost of a tent and hover combined is less than that of a colony house of wood.

New York. F. M. VAN SYCKLE.

Subscribers Exchange

WANTED for Connecticut Agricultural College, Instructor of Poultry Husbandry. Graduate of Agricultural College, with teaching and practical experience. Salary, $125 per month. Also Manager of Poultry Plant, college course required; $75 per month. Tests will be held March 25 at Hartford, Conn., or elsewhere to suit convenience. Send for application to State Civil Service Commission, Capitol, Hartford, Conn.

35-LB. COLT ACETYLENE GAS MACHINE for sale or exchange in good condition; full equipment, including pipes, brackets, etc. Price $50. J. B. BROWN, Bridgehampton, L. I., N. Y.

SPRAYING OUTFIT FOR SALE — 200-gallon tank; spiral agitator; Gould's triplex pump; Fairbanks engine, 3 horse-power; mounted on steel trucks with brakes; nearly new $150. F. ROSSMAN, Valatie, N. Y.

FARM—168 acres, best corn land, $100 per acre. Address owner, D. E. CHILD, Findlay, Ohio.

FOR SALE—182-acre farm; particulars, photo. W. L. HANNAH, Freeport, Me.

SOUTH FLORIDA lake front fruit land to exchange for fruit land in New England or New York. E. PUTNEY, Avon Park, Florida.

585 ACRES—Dutchess County; choice dairy farm; two sets buildings; lake. Inquire, F. R. KEATOR, Attorney-at-Law, 22 Exchange Place, New York.

50 ACRES FOR SALE—7-room house, barn, granary, hog pen, hen coop, milk house; all in good condition; 125 maple trees, 100 apple trees; half mile from town; spring water at house. Price $1,500; $500 down. FRED DRAKE, Shingle House, Pa.

SPECIAL FARM FOR SALE—91-acre farm, 1½ miles from Quakertown, near trolley line; bank barn for 30 head, and other outbuildings; plenty of fruit, good water; six acres of woods; all fields machine worked for quick sale. $6,500. IRWIN NEIL, Quakertown, R. D. No. 2, Bucks County, Pa.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Married man that understands dairy and poultry on a private place. Mr. ARTHUR BENNETT, Supt., Siegfried, Pa.

GARDENER SEEKS SITUATION—Age 29; good references. S. STEVENSON, R. D. No. 5, Simcoe, Ontario.

WANTED FARM HAND—Married; wages $30; cottage, garden. Connecticut. E. C. W., care R. N.-Y., 333 West. 30th St., New York.

WANTED AT ONCE—Two men to work in dairy barn. Address WOODCREST FARM, Rifton, N. Y.

WANTED—Single man to work on fruit and dairy farm; must be good milker; no cigarettes or booze. BOX 279, Wilson, N. Y.

WANTED—Position as foreman of farm by young married man of experience and ability; best references. R. D. 50, BOX 72, Rhinebeck, N. Y.

WANTED AT ONCE—A reliable married man for farm work; give age, family and wages in first letter. J. B. BRIGGS, Great Barrington, Mass.

1912 GRADUATE of New York State College of Agriculture desires responsible position; good references. W. N. J., care R. N.-Y., 333 West 30th St., New York.

WANTED—a single man as poultryman; state experience and wages expected in first letter; references required. GRASSLAND FARMS, Chapinville, Conn.

WANTED—Sober, industrious man to assist with orchard, greenhouse, poultry; some experience necessary; $50; single preferred; references required. C. R. WILLIAMSON, Lancaster, N. Y.

FARM FOREMAN; married, one child; understands the care of horses, cows and poultry; also first-class gardener; wages $60 and found. G. McNALLY, 266 West 21st St., New York City.

FARMER—Wanted married man as working farmer; house, fuel and farm produce supplied; give references and wages desired; Westchester County. Address W. A. F., care R. N.-Y., 333 West 30th St., New York.

WANTED—Cheerful, willing and efficient woman for general housework in farm home, 16 miles from Boston; no washing; permanent position; good home for right party. DR. STELLA CRANE, 224 Huntington Ave., Boston.

WANTED—A man, either single or married, with no children, as working foreman on a small farm; wages and a commission will be paid. W. P., care R. N.-Y., 333 West 30th St., New York.

FARM MANAGER wants position; married; 38 years; practical life experience, all branches; first-class executive ability; sober, honest, reliable; reference; state salary. Address TRUSTWORTHY, care R. N.-Y., 333 West 30th St., New York.

WANTED—Position on farm by capable, experienced young man; single; Cornell winter course graduate; good milker, good teamster; understands care of poultry and stock; best references. B. C., care R. N.-Y., 333 West 30th St., New York.

POSITION WANTED BY AMERICAN, age 42, as working farm manager or superintendent on or before April 1st; 20 years' practical experience; stock raising, modern dairying, raising crops and Alfalfa, soiling, farm machinery, gasoline engines, poultry, etc.; best references; please give particulars and wages. Address P. O. BOX 16, Dummerston Station, Vermont.

FARM FOR SALE—For particulars address Mrs. N. M. KISTLER, Emporia, Virginia.

FOR SALE—A suburban fruit and poultry farm. Address I. OWEN, P. O., Paterson, N. J.

600 ACRES South Jersey farm, best climate, markets; location; $20 an acre. PURVIS, Roseuhayn, N. J.

WANTED TO RENT, with the option to purchase, a small equipped poultry farm. J. V. T., care R. N.-Y., 333 West 30th St., New York.

The General says:-

ROOFING

says that ***Certain-teed*** *must* give you 15 years guaranteed service at *least.* And the biggest roofing manufacturers in the world are back of that statement. The ***Certain-teed*** label protects the dealer who sells, as well as the farmer who buys.

Your dealer can furnish ***Certain-teed*** Roofing in rolls and shingles—made by the General Roofing Mfg. Co., *world's largest roofing manufacturers.* East St. Louis, Ill., Marseilles, Ill., York, Pa.

"'Sal-Vet' results are entirely satisfactory. I bought it to rid my sheep of worms, and it certainly did the business. Also fed it to horses, colts and cows, and they are all doing finely."
L. J. ALLEN,
Willseyville, N. Y.

"Some of our neighbors have lost all of their pigs, and some of ours were not doing well, either; but since feeding 'Sal-Vet' to them they are doing fine." ISENBARGER BROS.,
Rt. No. 2, Battle Creek, Mich.

"I had two lots of hogs. To one lot I fed 'Sal-Vet'; was pleased with results, as they went to market in fine condition. To the other lot I fed no 'Sal-Vet.' These hogs did not fatten nearly so well, and at killing time we found many worms in them, while those that had the 'Sal-Vet' had no worms.
I have good faith in my hogs. They look well; but I also have faith enough in 'Sal-Vet' from my experience to believe that it will make them look better." ELWOOD CROSSLEY,
Rt. No. 1, Bloomsburg, Pa.

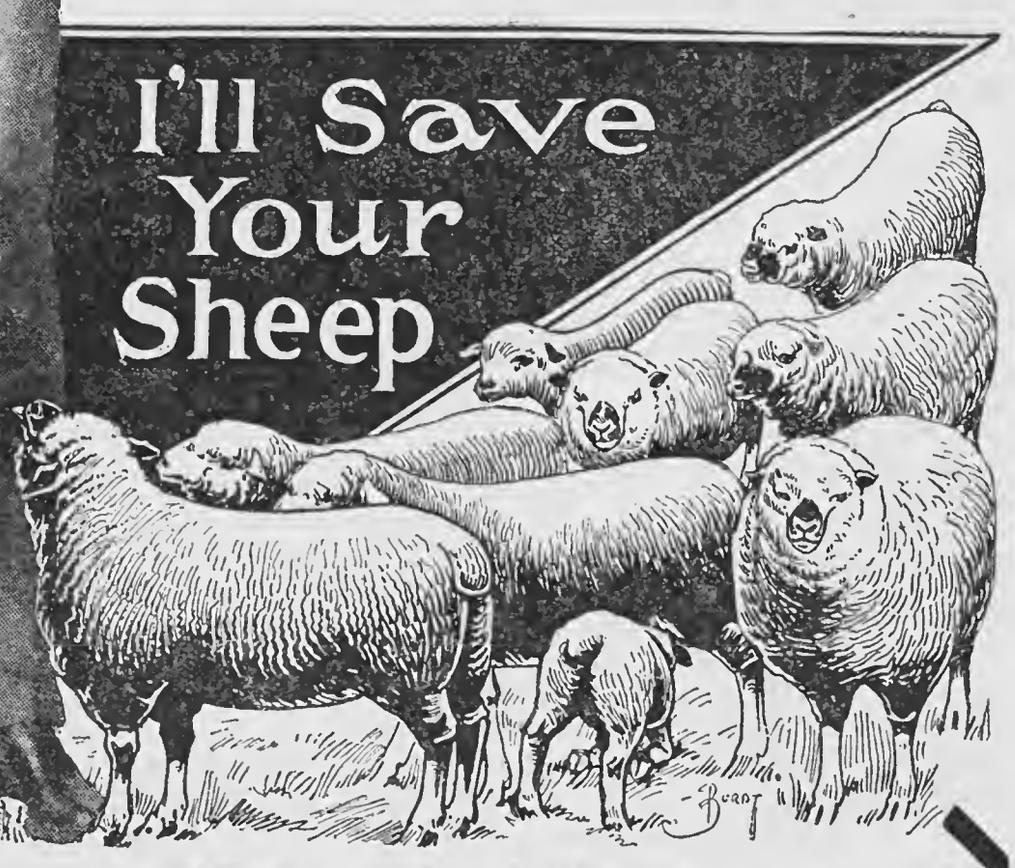
"I lost fifty dollars' worth of lambs from worms. Am sure that if I had had your 'Sal-Vet' sooner it would have saved me this fifty dollars, as I have not lost one since I began feeding it. Have also been feeding 'Sal-Vet' to a bunch of shoats; they are now the finest in town.
W. A. TOBY,
Lindley, N. Y.

"I lost a number of hogs, and more were dying; then I sent for your 'Sal-Vet.' Fed it to them immediately upon its arrival, and they at once picked up and are flourishing and thriving like the biblical 'green bay tree.' We have been killing some of these hogs and selling them for more than the market prices. If it had not been for the 'Sal-Vet' fed them, I am sure that we would not have one left to sell."
EDWARD F. DIBBLE (Seedgrower),
Honeoye Falls, N. Y.

"I have kept hogs all my life, and have fed lots of grain to make them grow. I sold one lot of hogs before I got the shipment of 'Sal-Vet,' but kept an equal number. I fed 'Sal-Vet' to the latter for two weeks, and while they were not as old as the first lot, I sold them and they weighed 250 pounds more than the oldest which had not had 'Sal-Vet'."
JOHN E. SEVERENCE,
Savannah, N. Y.

I'll Feed Your Stock 60 Days Before You Pay

I'll Stop Your Losses From Worms Or No Pay



I'll Prove It On Your Own Stock

I don't ask you to pay me one single cent until you have fed SAL-VET for 60 days and seen with your own eyes it's wonderful merit. I don't ask you to send me a penny **until I prove to you, on your own stock,** the great value of SAL-VET as a worm destroyer and conditioner. I have shipped tons and tons of SAL-VET to readers of this paper who have accepted my "no money down" offer. I want an opportunity **to show you** who have not yet accepted it, that it pays, and **pays big** to feed SAL-VET regularly to all your farm stock — Hogs, Horses, Sheep or Cattle. You have nothing to risk — everything to gain.

The Great Worm Destroyer

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Live Stock Conditioner

makes all animals **thrive better, look better,** destroys and expels intestinal and stomach worms which prey on the digestive tract, **robbing** your animals of vitality and strength and keeping them in an unthrifty, unprofitable condition. SAL-VET will put them in condition to get more good out of their feed—makes them thrive faster — stops your losses from worms, makes stock sleek in coat, vigorous in action, and far better able to resist diseases. Millions of dollars are lost every year by stock raisers who do not keep their animals worm-free, healthy, and in a condition to get all the benefits of the rations fed.

My Best Advertisement Is A Pleased Customer

"I am as strong for SAL-VET as ever. Almost every one, in these parts, has lost hogs, but mine are still doing finely, thanks to SAL-VET." Dick Crookham, Lacey, Ia.

"SAL-VET has been a great help to my hogs as none have died since I fed it, although previous to its use, I had a number of losses. T. J. Reed,
Rt. No. 1, Hutton Valley, Mo.

"Hog cholera has swept this part of the country, but for the first time in years, my own hogs escaped. I have been feeding SAL-VET and now I would not be without it for double the price."
Thomas Fitzgerald,
Rt. No. 2, Connersville, Ind.

"I took some of my poorest and weakest pigs, shut them up in a lot by themselves, and fed them SAL-VET in order to make a test. I found SAL-VET all you claim. These pigs are now good, strong, healthy shotes, weighing 125 to 150 pounds. I shall always feed SAL-VET the year 'round."
W. A. Kearn, Rt. No. 1, Tampico, Ills.

"Your SAL-VET is certainly all to the good, and you may always count on me to be a booster.
When the SAL-VET arrived, our hogs were either all sold or dead with cholera. There were five little runts alive, which were considered as good as dead, but, thanks to SAL-VET they are the best looking hogs of their age in the neighborhood.
My one regret is that we did not get SAL-VET sooner, as I feel that we could have saved the whole bunch."
LeRoy A. Barrett, Oswego, Ills.

"When the SAL-VET arrived my hogs were sick, and up to that time, I had lost sixteen pigs, all under twenty pounds. After the balance of the pigs had access to SAL-VET, they came through all right, and some of them now weigh 525 pounds, which I consider pretty good. I am talking SAL-VET to every man I meet, as I honestly believe it is the one conditioner and preventitive to feed to hogs the year 'round." Ben E. Woitte,
Prop. North Grove Farm,
Rt. No. 1, Milbank, S. D.

"When we butchered our hogs, we found them entirely free from worms, although before we began feeding SAL-VET, one hog in particular seemed badly out of condition and was coarse and rough. When we butchered him, he was the smoothest and fattest hog in the bunch."
F. H. Durflinger,
Rt. No. 8, Van Wert, Ohio.

Look For This Label on all SAL-VET packages. Don't be deceived by imitations.

Don't buy "Sal" this or "Sal" that; get the original genuine SAL-VET.

PRICES 40 lbs., $2.25; 100 lbs., $5; 200 lbs., $9; 300 lbs., $13; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular sized packages.

Don't Send a Cent—Just the Coupon

Tell me how many head of stock you have and I'll ship you enough SAL-VET to feed them 60 days. You simply pay the freight on arrival—feed it as directed. At the end of two months report results. If SAL-VET has not done all I claim, I'll cancel the charge — you won't owe me a single penny. Send the coupon today and begin action against worm pests—the greatest enemy you have to contend with in raising stock.

REGISTRATION OF LAND TITLES.

The Torrens System in Ohio.

When John Jones sells his farm to William Smith they first agree upon the price, and then Jones begins the long, tedious and expensive procedure of transferring the title of his farm to Smith. The first step is to employ a lawyer to prepare an abstract of the title of the property which shall go back to the original grant of the land from the government to a private owner. Every transfer of title of the property that has ever been made, all liens that have been recorded against the property, must be shown in the abstract, and before a clear title can be given the abstract must show all claims against the property on the part of heirs, satisfied. After the abstract has been prepared with all possible care and by the best legal talent Jones presents it to Smith, who in turn must employ a lawyer to examine the abstract and render an opinion as to whether the evidence of title as shown in the abstract is satisfactory.

Suppose Smith sells the farm again within a year, what happens? The same thing over again. Smith may use his abstract as he received it from Jones and have his lawyer continue the abstract on down to date. The third party to whom the farm is sold must have his lawyer examine the abstract of title just as has been previously done. Why all this machinery for the transfer of real estate? Personal property may be bought and sold and exchange owner within a few minutes or hours at most, but not so with real estate, its exchange is hedged about with so many requirements that its value as security for credit is materially lessened.

TORRENS SYSTEM OF REGISTRY.—In recent years a new system of the registration of land titles and transfer of real estate has been adopted in some of the States, known as the Torrens system of land registration. This system takes its name from Sir Robert Torrens, an English Colonial statesman, who introduced the system into South Australia in 1857. It rapidly spread into other colonies, and has now come into general use in Canada, and has been adopted by nine or ten American States. The Torrens system is based on the principle that the Government guarantees the title to real estate each time it is transferred, making abstracts of title and ancient history of the transfers and encumbrances that have concerned the property of no avail. The Ohio Legislature adopted the system last year, and it will go into effect July 1st, 1914. A similar law was passed by the Ohio Legislature in 1896, but was declared unconstitutional in a suit that was brought the following year. In the revision of the State Constitution in 1912 an amendment was adopted making specific provision for registering land titles.

HOW THE SYSTEM WORKS.—Under the Torrens system a registrar of titles is established in the county, and an owner may have his title examined by this officer and if found to be good a certificate of title is issued to him by the State, certifying that he is the owner of the land in fee simple and the title is incontestable. After the title is once registered there is no further need of abstracts of title, continuation of abstracts or opinions of attorneys. The certificate of registration is the absolute and conclusive evidence of the title.

A MILK-MAKING HOLSTEIN. SHE CAN GIVE 36 FAMILIES ONE QUART EACH PER DAY. Fig. 166 (See Page 456).

In order to provide for any error that may arise in the registration of land titles a small percentage fee based on the selling price of the property is charged for registering the title. This fee goes into a guarantee fund that is held to indemnify owners of property of which the title is registered if at any time in the future it should be proven that the title is not good. In Illinois, where the system has probably been used more extensively than any place in the United States, there has been no case thus far in which the State has been called upon to make good a defective title that has been registered. An estimate of the value of the system is given in an editorial in one of the leading Chicago daily papers as follows:

The Torrens system is a cheap, simple and easily accessible way of securing an absolutely and permanently secure title to real estate. Under it the owner of a given piece of real estate can go to a public official, file an application and in about 30 days secure a decree from court certifying his title to his land. The whole proceeding will cost him about $24. If within two years of the time when he gets his certificate no one comes forward to make a claim that his title is defective it becomes incontestable for all time. Once registered in this way the possessor of the certificate need trouble himself no further with costly abstracts and examinations and continuances. If he desires to mortgage or sell his land he can do so within a few hours' time, and the entire cost will be but $3, where a sale or mortgage under the present system involves an expense of from $15 to $50 for attorney's fees and from $5 to $35 for the continuance of the abstract.

The Torrens system is as safe for the owner of a downtown corner as for the owner of a little home on the outskirts of the city, but it is the latter who can least afford to pay the heavy fees now charged for abstracts and examinations. The owners of such property will study their own interest and protect their own pocketbooks if they take time to investigate the advantages of the system, particularly if on the point of making a sale or a loan involving an examination of title. If they have no such transaction in view it will still be to their advantage to ascertain whether it is wise to register their land under the Torrens system. By doing so they will make sure that should they in some time of financial trouble be forced to mortgage or sell they can do so inexpensively and without delay. Above all, they will be assured that at the expiration of two years their titles are clear beyond dispute.

CAUSE OF OPPOSITION.—The opposition to the adoption of a system of registration of land titles by the State comes principally from the large guarantee companies that make a business of guaranteeing titles to real estate. It means taking away their business. But the private citizen who has no selfish interest in the matter cannot understand why an officer of the State Government should not be authorized to examine titles and guarantee them for the State instead of leaving it to wealthy corporations that levy exorbitant charges for their services. Why should not owners of real estate be able to have their titles examined, and if found good have that fact recorded, so that at no time in the future will it be necessary to go back of the finding?

Under a system of registration of land title, the transfer of real estate is simplified, the cost is only a fraction of what it is under the present system, the value of real estate as security for credit is increased and bad titles disappear. It is a system that is of vital importance to farmers, and they should demand that their respective States provide for it. H. C. PRICE.

Ohio Agricultural College.

CONTROLLING THE ELEMENTS SUCCESSFULLY.

Fighting Frost in Ohio.

We installed the orchard-heating system in the Spring of 1911. We constructed a cistern of 20,000 gallons capacity on top of a bluff, about centrally located in the orchard; a pipe from the bottom of the cistern extends through the bank, with a faucet on the end; the tank wagon is driven under it and filled in a few minutes. The oil used is principally refined, bought in tank carloads. Much the greater part of our trees are 26 years old. Our heaters hold three gallons; have a sliding cover that protects the oil from the elements, distributed one per tree, placed on the northwest side, eight to 10 feet from the trunk of the tree.

The heaters should be filled with oil by the first of May; earlier will do no harm, as they *must be ready on time*. In the Spring of 1911 we were all ready to apply the torch; the thermometers were watched several nights very carefully, but the danger line in temperature did not come. After the danger period for frost had passed, the oil was returned to the cistern and the heaters stored in the dry.

I am glad to know that the beautiful Spring time will come again. A little before the first of the following May we were all ready again to battle with the elements, if necessary, but the weather was favorable; no need of firing the heaters. Again the oil was returned to the cistern and the heaters housed in the dry. While this work was being done I had my partner—a son of mine—bring one of the heaters to the yard. We had never seen one lighted up, so he applied the torch, and it blazed up fine, about three feet high. The day was a little raw, and he pulled up an old chair and I sat down. He said I could warm my "shins."

We talked matters over a little; I made some remarks concerning the seeming unnecessary expense we were to with the heaters. "Well, Daddy," he said, "if we have scared the enemy away by having a weapon ready it is much our cheapest way out. If we were obliged to fire up it would cost us probably $150 a night." I said: "My son, you are all right; I believe in arbitration, if it can be done honorably; if not, then apply the torch." This same doctrine applies to our country: "In time of peace prepare for war." No doubt we will always have plenty of steel for all the pruning hooks and plowshares and all the cannons this country will ever need. I am not in favor of war except to save our honor. No doubt a thorough readiness for any emergency is a great factor to promote arbitration and peace and observance of the Monroe doctrine. No doubt our navy is doing good floating about on the Gulf of Mexico.

Well, the beautiful Spring time came again and all were ready on time to apply the torch if need be. After having quite favorable weather for some time, by the 9th of May the orchard was in full bloom, except a few of the late bloomers; the orchard never looked more beautiful. The weather was perfectly clear, as it had been for some time. The following morning, which was the 10th of May, 1913, it was much cooler, with a breeze from the northwest, growing colder rapidly. I told the boys a blizzard was on, to be sure to be ready for the battle to-night. They said "All right, Daddy; we will be on hand." The Chief of the Weather Bureau at Columbus, Mr. Smith, telephoned us that day in regard to the frost that night, but we were on to our job before we got word:

Everything indicated frost that evening—clear, perfectly still and cold. By seven o'clock the men were out with torches and buckets containing a little gasoline to facilitate igniting the oil, first firing in the valleys and depressions, where it freezes first. We have lost crops in the valleys when the tableland escaped. The work was rapidly done: and the orchard all lit up with blazing fires, the trees in full bloom beneath a firmament decked with stars, made a night picture so unique and of such marvelous beauty. I shall not undertake to describe it. During the night everything was looked after, temperature and heaters, to see if the latter had burned dry, which they did not during that night. In the morning I was up a little early for me; the registering thermometer indicated 23 degrees. A basin of water set in an opening, two feet up from the ground, had ice on it one-fourth of an inch thick—solid, as the boys say, which made things look a little dubious; but a look over the orchard made me more hopeful. Not a leaf was in motion, the horizon perfectly clear, a dark mist of smoke, heat, etc., covered the whole orchard like a canopy; the environment around the orchard was clear. This indicated that the benefit of the heaters remained in the orchard and saved the crop.

Am I right? There can be no doubt that this system saved the crop. There were no apples in this section of central Ohio. It is a question if the night had been windy, with a temperature of 23 degrees as we had that night, what would have been the result. The following day the heaters were replenished with oil and fired late in the evening, but the blizzard had subsided and the frost was not severe enough to scare anybody. The weather warmed up at once and in a little while the tiny apples could be seen growing just fine. Certain now that our efforts were crowned with victory. The final result was a very fine crop of apples, almost a bumper crop.

Much the greater part of our trees are 26 years old, planted in Blue-grass soil. The "grass mulch system," of which I am called the "Daddy," was adhered to from the start. The orchard run per tree was 35 to 40 bushels. The old yellow Bellflower, and a few others, won't produce as they did 50 to 60 years ago, yet we had quite a crop of Bellflowers; the price they bring helps make up the deficiency—$7 a barrel, and the other varieties $6.50 to $5. It does a man good to get his money back.

Some people tell me "You are a lucky fellow." I hardly need say that it's the man that makes his luck, but no doubt kind Providence will smile most on people that are trying to help themselves. Our apples are keeping fine in our own cold storage. I am in my eighty-fifth year, and have lived among the trees on this hill-top, in a loop of our beautiful Olentangy River, overlooking the classic city of Delaware, since 1834. F. P. VERGON.

SOY BEANS, COW PEAS AND RYE.

I note in recent issues that Soy beans are recommended to be sown in drills and cultivated, which no doubt is best when team work is not too expensive. I have a young orchard, but must hire all team work done; for several years I have sown a mixture of Wonderful cow peas and Mammoth Yellow Soy beans about June 10. These are strong-growing kinds and make a heavy crop but do not ripen seed. Then without plowing again the last of September I sow rye broadcast. The Fall rains sprout this rye, and perhaps two-thirds of it roots well; the frost kills the Soy beans and cow peas. This rye seems to do well, and in May this has made a good growth and is plowed under, the ground tilled a few times and again in June the same mixture sown. The trees are making a good growth with minimum cost for team work. Part of the orchard is now bearing and with three sprayings has yielded excellent crops, especially apples, and sold locally at $1 to $1.25 per bushel; soil gravelly clay.

Ohio. W. C. BAIRD.

R. N.-Y.—This plan is first rate, where the soil is naturally strong and well watered. It saves a vast amount of labor, keeps the ground well covered and supplied with humus. We should use annual applications of lime when plowing this stuff under. We doubt if the plan can be fully recommended for light soils which are naturally lacking in moisture. This is another illustration of the fact that the owner of the farm must adapt his plan to the soil needs, and not depend on general advice without figuring out carefully his own conditions.

USE OF FIRE EXTINGUISHERS.

T. B. S. asks for information concerning the solution used in bottles for fire-extinguishing purposes. I can help him in that part, although I cannot give any information about the use of carbon tetrachloride. Twenty years ago the bottles he mentions were to be seen everywhere, usually three bottles in a wire basket hanging from the wall. They were much advertised under the name of "hand grenades," and demonstrations of their use were given in most of the large towns. For these demonstrations miniature buildings were usually erected on a vacant lot, and after a crowd had collected, the structure was drenched with kerosene and fired. Then the fire was extinguished by breaking two or three grenades over the blazing surface.

The fire was never allowed to char the wood deeply, and no part of the burning surface was out of reach of the falling liquid. There was nothing marvelous about the performance, unless we consider the skill of the demonstrator in spreading the contents of the bottles where it did the most good. This knack was not acquired by the purchaser, as many found to their sorrow. The solution used in the bottles was simply brine. Common salt, alum, sal-ammoniac, or any soluble salt, or a combination of salts, can be used. Alum is probably the best for efficiency; its cost makes it prohibitive in large quantities. A mixture of alum and common salt is good, say one part of alum to 10 parts or 15 parts of salt. Common salt alone is good enough. Such a solution quenches fire readily; more so than water. On evaporation a crust of salt is left on the burned surface, which prevents, or hinders, further burning. That is the secret of the bottles. They were but one of the many fire-quenching devices that come and go as regularly as the seasons. Many a fine building has been destroyed because of too great a faith in the efficacy of worthless contrivances.

The one type of fire extinguisher that has been in use for years, and practically the only type adopted by the municipal fire departments, is the type described by R. P. C., using bicarbonate of sodium solution and sulphuric acid. This is the solution used in the chemical engines. The patents expired long ago, and there are some good designs on the market, also a great many cheap, flimsy, dangerous affairs.

For farm use a few barrels of brine, scattered around, with a pail near each barrel, gives better fire protection than as many extinguishers. The action of the carbonic acid gas in quenching fire is much exaggerated. It does smother flame, but only where it is confined. In an ordinary sized room it is carried away too quickly to be of use. The acid-soda extinguisher can be made more effective by the addition of some heavy salt, as is often done to prevent freezing of the chemicals. F. R. L.

Connecticut.

OVERRATED PROFESSIONS.

I read with much interest Mr. T. H. King's pertinent comments on the excessive charges of lawyers. Members of the legal profession certainly have a high estimate of the value of their services. There is in fact no justice in their claim. The average lawyer studies less and knows less than men in several other professions. He has less capital invested than most professional men. Why, then, is he so overrated? He makes and bedevils the law so that an ordinary man cannot understand it, the lawyers themselves differ as to its meaning, and the judges guess at it or make it over to suit their own ideas. Lawyers reap their harvest out of the ignorance of the people and their misfortunes. They also draw the large fees for protecting law-breakers against the penalties of their crimes.

There is a remedy that the people will employ later on. Is it not strange that society as a whole employs lawyers and pays them to prosecute individuals, while the individual must employ his own lawyer and pay the bills in order to get a hearing in court? The district attorney works for one side only, whereas he should work in the interests of justice for the individual as well as for society. Things are now organized to give the strong an advantage over the weak, amounting in many cases to tyranny. There should be a change, and one will be made when the common man is fully in power. In fact, every man should be his own lawyer. The laws should be made fewer and simpler, and put in form to be easily read by men of ordinary intelligence. Too much mystery is thrown about the laws that everyone must obey. Our laws are still in primitive form, almost barbaric.

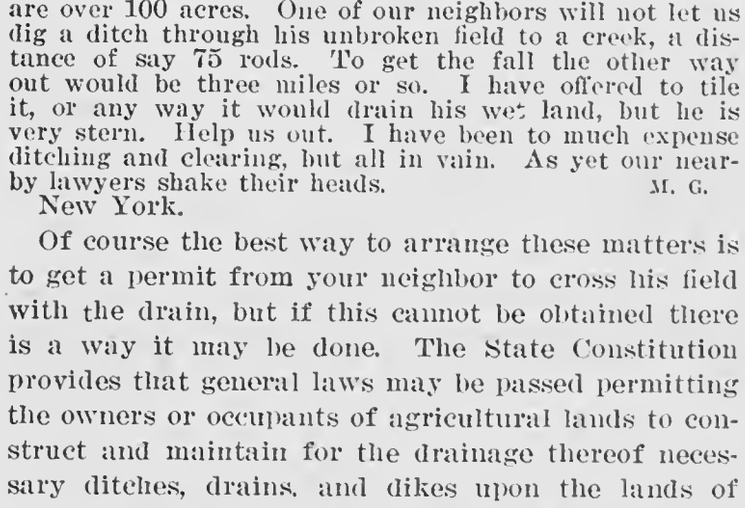
The farmer suffers as much as anyone from ignorance of law and consequent fear of it. He dares not employ a lawyer and face the cost. He therefore submits to injustice and allows his dishonest neighbor to infringe upon his rights. The way to avoid war is to be prepared for it, and the way to keep out of the hands of lawyers is to know the law.

A. C. HILL.

DRAINAGE OF ONE FARM THROUGH ANOTHER.

We have on our farms some muck lands that the Ithaca Experiment Station pronounces first class. There are over 100 acres. One of our neighbors will not let us dig a ditch through his unbroken field to a creek, a distance of say 75 rods. To get the fall the other way out would be three miles or so. I have offered to tile it, or any way it would drain his wet land, but he is very stern. Help us out. I have been to much expense ditching and clearing, but all in vain. As yet our nearby lawyers shake their heads. M. G.
New York.

Of course the best way to arrange these matters is to get a permit from your neighbor to cross his field with the drain, but if this cannot be obtained there is a way it may be done. The State Constitution provides that general laws may be passed permitting the owners or occupants of agricultural lands to construct and maintain for the drainage thereof necessary ditches, drains, and dikes upon the lands of others, under proper restrictions and with just compensation. Laws have been passed allowing any person owning or possessing any swamp, bog, meadow or other low or wet lands within the State who wishes to drain the same in the interest of public health or for their improvement for agricultural purposes and who shall deem it necessary in order that a ditch or ditches, or other channels for the free passage of water should be opened through lands belonging to another person, may present a duly verified petition to the county court setting forth the



STRIPED CUCUMBER BEETLE AT WORK ON YOUNG SQUASH. FIG. 167. (See page 444.)

facts and the names of the owners of all lands to be affected by the proceedings, and praying for the appointment of three commissioners for the purpose. The court, if satisfied that such drainage is necessary, shall appoint a commission of three persons, one of whom must be a civil engineer or drainage expert, if one can be found in the county, who after due notice to all parties shall hear and determine the matter; first, whether it is reasonably necessary or practicable in order to drain such land that a ditch or ditches, or other channels, for the free passage of water should be opened through the lands belonging to others; second, whether it is necessary either for the public health or for the improvement for agricultural purposes, or for both, that such lands should be drained; third, the probable cost of such drainage and the result that such drainage

CABBAGE WORM ADULT AND CATERPILLAR ON CABBAGE LEAF. FIG. 168. (See page 444.)

would produce. The law then provides that the commission shall give notice to the parties, view the lands and take whatever proceedings they deem necessary to come to a conclusion in the matter. They shall then file their determination in the office of the county clerk and give notice of the filing thereof to the parties interested. Then if the commissioners determine that the improvement of agricultural purposes demands that ditches, drains or channels should be opened or that lands should be drained, it shall be their duty, unless the petitioner or the owner of the property can do it to their satisfaction, or can agree that a map and survey are not necessary to do the work, and to employ a competent civil engineer or surveyor to make an accurate survey of the premises and of the ditch, drain or channel found necessary. The commission

F. P. VERGON, A VETERAN FRUIT GROWER. FIG. 169.

may then take all the steps necessary for the construction and completion of the ditches or drains they may deem sufficient for the complete drainage of the low lands. If the commissioners cannot agree with the owner of the land across which the ditch or drain is to be placed in regard to the compensation for the damage done him, they shall proceed to acquire title to whatever easement may be necessary upon and across the land of such person in the manner, so far as applicable, prescribed by the condemnation law. But the proceedings above outlined shall not be taken while a valid contract is in force between the owners of adjoining properties in regard to draining their wet lands. The commissioners are paid $5 each per day for every full day employed, and their expenses, and after they have finished their work they assess damages against the land owners benefited, or against the village or town, if it has been benefited, and apportion the assessment among those benefited.

Of course, from these proceedings an appeal may be taken. These are quite lengthy and somewhat costly proceedings, but it was only by amending the Constitution that one person was given the right to condemn the land of another, or to obtain without the consent of the other, the right to cross or to use the latter's lands. If you cannot get the consent of your neighbor, you must take this proceeding. If you can get a permit from your neighbor, it is easily drawn and should be acknowledged by him and filed the same as a deed in the county clerk's office.

M. D.

GREAT NEW YORK APPLE RESULTS.

Do we realize the value of our Eastern orchards? It is brought home to us by incidents of which the following is only one of many: Last week a car of apples was sold in New York City, and not five or ten barrels, but all the Greenings in the car brought $7 per barrel. This sale was the result of several years' hard work, careful study and invested capital. It meant that the greatest care had been taken with this particular crop from the pruning last Winter, the several sprayings during Spring and Summer, the constant cultivation, to careful handling, during the picking and packing season.

No small credit is due the workers on the farm. Their thoroughness in the orchard work, painstaking care not to bruise the fruit in picking, and accuracy and good judgment in sorting and packing showed a personal interest in the work.

It meant the coöperation of the chemical storage company, for eternal vigilance on the part of the storage is the price of safety, and the fruit received good care. It meant that the commission man, much abused and often unjustly so, had done his part at the other end, making the growers' interests his own and taking pride in having fruit to sell which called for no apology. It meant that with his aid a brand had been established on the market so that the buyer knew what he was getting without emptying every barrel, and a demand had been created for this particular mark.

And the resulting feeling of satisfaction comes from a knowledge that one's produce is bringing what it is worth, and is possible to everyone, whose aim is not to do the consumer, but to bring his product up to the highest possible standard. It is again demonstrated by these prices that, compared with Oregon orchards at $12 and $15 an acre, there are orchards in the East worth at least $3,000 an acre. In fact, we know that some years they pay 10 per cent on a valuation of $5,000. F. W. C.

THE SOIL ALONG FENCE ROWS.

I have owned four farms, and I have noticed that as a rule, a fine crop of locusts grows along fence lines and brooks when permitted. The land where fences have stood for many years is practically virgin soil from not having been cultivated. I have also noticed that trees always thrive along the borders of a brook, presumably because they never have to go thirsty.

F. E. H.

It is true that trees grow well along streams for the reason you give. On the uplands such locations are good for apple and sometimes for peach. On the lower lands the banks of streams are too wet for peach. Such varieties of apples as Northern Spy, Greening or Russet do fairly well on wet land, but it would be no place for a variety like Baldwin. The land along fence rows is usually rich. It has not been exhausted by cropping, and year after year large quantities of leaves as blown by the wind are caught and held by the fence rows. These decay there, as do the grass and weeds, briers or

WORK OF WIREWORM IN POTATO. FIG. 170. (See page 444.)

brush which grow and are cut down or left to decay. The fence row is also a place to throw stones. These accumulate, keep the soil moist, and attract thousands of insects or mice and other vermin. These die and enrich the soil still further, so that these fence rows become the richest strips on the farm, and fruit trees always do well there.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Lime and Phosphoric Acid.

Does land that needs lime to correct the acid in it need phosphoric acid as a fertilizer? J. J. J.
Willards, Md.

Not always. Land may be very sour, so that lime is needed, and yet contain plenty of phosphoric acid. When soil is lacking in available phosphoric acid, grain crops are slow to mature, and the seed or grain is apt to be light or shrunken. Where there is plenty of this element the grain crops mature early and give plump, heavy grain. Why not test the soil? Try acid phosphate on strips through the corn or other grain, and watch the growth on these strips as compared with the rest of the feed.

Sowing Asparagus in Permanent Bed.

How will it do to plant asparagus seed where plants are to grow permanently, thin out to a foot, then soon as the female plants show, cut out these and only leave the males so as to do away with volunteer plants? Are males as prodnctive as females? Our market demands green "grass." Is there objections to having plants so close to surface?
University Park, Col. G. W. H.

It does not pay to sow asparagus seed in its permanent place. Why? Because asparagus roots must be set seven or eight inches below the level of the ground, also the beetles and larvæ are more difficult to control (weeds also). Sowing the seed in drills is cheaper because all cultivation is easier and more effective. We use a hand cultivator more than a horse-hoe, because we can use it faster. Then again when we spray it is easier, cheaper and better in drills than when so spread out two or three feet apart. The seed drills should be planted about one inch deep and four or five to the foot. It may pay to try to select the male plants, but most growers will not venture. The male plants are not distinguishable the first year as a general thing, but they produce larger stalks and thus are more profitable. It hardly pays to bother with them, however. Female plants produce more stalks than males but on the whole the large stalks from male plants are easier cut and packed, and of course sell for more money. Good one-year-old roots are selected better when grown in seed bed, and thus selected grow in fine shape. C. W. P.

Shall We Plant Fancy Varieties?

Does your experience show that it really pays to grow and sell finer varieties of apples? As a rule such fruits are not the heaviest yielders, and are often less hardy than the so-called "commercial" sorts. The finer fruit ought to bring more, but does not always do so in the general market. For the average grower of fruit, knowing the market as you do, would you advise planting the fine dessert varieties or the standard old sorts which fill the general requirements?

I have never tried to grow the fancy kinds of apples; for me, the standard varieties. Had I the location near a large city, and had the time and inclination to "peddle" I might try the fancy fruits. E. C. GILLETT.
New York.

I should advise planting the standard old sorts, for the reason that they are known on the market and sell readily. Unknown or uncommon sorts, no matter how fine, do not sell well. The dessert varieties should be grown by the amateur, and incidentally I might say that many, if not most, of the finest varieties are being overlooked, and very soon will be lost entirely. A good garden should include a variety of the choicest ripening in succession. What is there better to eat than a good apple, and we can have them without much trouble, so very fine. I suggest dwarf trees for small gardens.
New York. W. C. BARRY.

For the average grower, I would advise, by all means, to use largely of the standard sorts. But for myself, and handling largely in a local market, I should, and have planted much wider not omitting the standards, but adding others that grow and do well and have quality; not necessarily new kinds, as one, Fall Pippin, a very old kind, is being much overlooked. However with it all, I think the care in preparing for market is the important thing. At the present time this will sell any kind. In any case one must have the crop to sell, and that means those that yield well.
Connecticut. A. G. GULLEY.

Some of the finest varieties of apples are the most profitable. Among these in the upper Hudson Valley district I would place Baldwin, Northern Spy, R. I. Greening and McIntosh Red. These would certainly be among the best commercial sorts. The Baldwin being always with us, few appreciate the fact that in its season it should rank among the best as to quality. Some of the so-called very fine dessert varieties have serious faults that really bar them from being planted by the average commercial fruit grower. They may require special soil and markets or such care in handling or storing as to make them a precarious proposition. Such varieties can only be profitably grown by the specialist who has made a special study of them. Newtown Pippin, Grimes Golden, Yellow Transparent and Jonathan as grown in upper Hudson Valley in this class. Growers who in their plantings have tied up to tried commercial sorts like Duchess, Wealthy, McIntosh, Greening, Baldwin, Northern Spy, King and Ben Davis have been the most successful, and the average grower would best not go very far away from the beaten path and chase catalogue rainbows. Some additional sorts that give promise of being good commercial varieties for this section are Alexander and Fall Pippin.
New York. B. D. V. B.

For the average grower, who has not a special market for the fine dessert varieties of apples, I should say grow the standard old varieties. But if the right man, who can look up the market for fine fruit, and has a joy in growing the finer varieties, such an one would do better to grow them, but not the average grower. DELOS TENNY.
New York.

Tree Growth.

After the first year I like to have the trees make from 18 inches to three feet yearly till they come to bearing age. One foot is a satisfactory growth for the first year. On an old bearing apple orchard if I get one foot of average growth I am satisfied. DELOS TENNY.
New York.

On young trees a growth of three or four feet per year is safe, or all they can put on and not winter-kill. On older trees that ought to come in to full bearing we notice that if trees grow more than a foot or 14 inches at tips they are quite likely to go to wood and give us little or no fruit. C. B. COOK.
Michigan.

Regarding the growth of apple trees, I would say this will depend largely upon the season, variety and amount of fruit upon the trees. I expect my young trees to make from 15 to 18 inches growth under almost any conditions and very often some vigorous growers will make from three feet upward. Of course large bearing trees which are very heavily loaded with fruit will not make as much wood growth. I would say from eight to 12 inches would be a fair growth in such trees.
New Jersey. J. H. BARCLAY.

Miss Wilkins, the primary teacher, was instructing her small charges. "Name one thing of importance that did not exist a hundred years ago," said the teacher. Ralph Franklin, an only child, who was seated in the front row, promptly arose and answered—"Me."—Credit Lost.

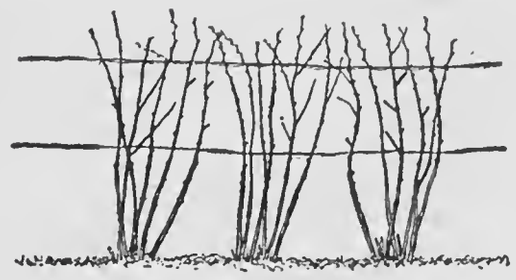
THE NEW BERRY CULTURE.

PART III.

For the busy farmer who wants a home supply of berries, and yet knows that he is likely to neglect them in the rush of other work, I would recommend that he plant one row each 100 feet long of the three kinds of cane berries, cultivate a crop of something between them the first year, then fix them up nicely early in the Spring, before the busy season, and mulch heavily with straw, marsh hay or any rough material, putting it on heavily enough to smother down the weeds. The cultivating would then be done for the year, and some one could surely find time to take out the

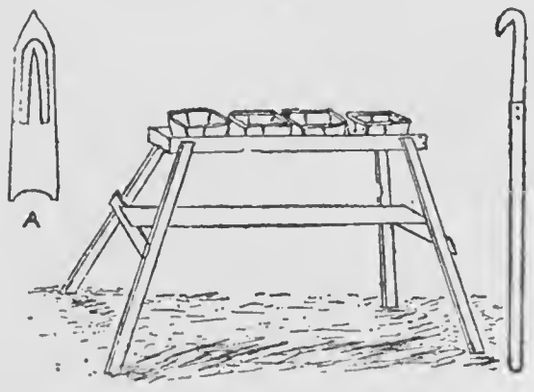


BLACKBERRIES TIED TO CANES. Fig. 171.

surplus canes. A patch of this size should produce fresh ripe berries for the family table every day for two months, and an abundant supply for canning.

It is a different thing to try to recommend varieties as those which prove best in one locality may take second or third place in another. The Cuthbert red raspberry is an exception to the rule; unlike others it seems to succeed well almost anywhere that red raspberries may be grown, and I consider it the best for general purposes. The Snyder blackberry is considered the hardiest of all, and is an upright grower, being more easily handled than most varieties. It ripens the entire crop in a few days, which is sometimes objectionable. Most writers recommend taking out the old canes as soon as the crop is harvested. If disease is present this may be best, but we do not take them out until Winter or Spring because it is very difficult to find time until our marketing is done. The new growth whips around worse in the wind where the old canes are removed, and we consider that thorough cultivation is of more importance to the vigor of the new growth than the removal of the old canes at this time. We also think that our berries are less liable to disease than those weakened by lack of cultivation, even when the bearing canes are promptly removed because the more vigorous a plant the more resistant to disease. Another objection we meet in our method of pruning or rather of not pruning but we have tested several ways of pruning and the result has invariably been a diminished yield.

I have met a number of men who refuse to believe the statement that red raspberries will produce more berries from one hill of six straight canes five or six feet high without any branches than the same hill would produce if the canes had been pinched back at three feet and made to branch. But not one of them had ever tested it. The fewer branches we get on any of the cane berries the better and yet we must not cut them all off. There is a vast difference between a cane that has grown without branches



CARRIER FOR BERRY BASKETS. Fig. 172.

and one with the branches removed. Page 346 shows the blackberries as they grew with the proper number of canes left in the hills. Fig. 171 the same hills after being tied. The cross shows where they were tied. Very little trimming was needed here, just a few branches clipped out where too thick after they were tied. Some varieties branch more and consequently require more thinning. Page 346 shows the red raspberries as they should be, when ready for the next crop. Here the tying is done by looping the string around the cane and the wire, in a half hitch, going from one cane to the next, sometimes for rods, without breaking the string. A hard knot should be made about every two feet, so that, should the string be broken, only a few canes will be loosened.

When the canes are irregular in size the short strings are used the same as in the blackberries. Fig. 172 shows one of our carriers, made of two pieces of half-inch boards and some plastering lath. The pickers set the baskets in double, then when full the top ones are lifted out and placed on the lower board so they can bring in eight quarts each time. Some of the larger pickers like to have the lower board wide enough to hold two rows of baskets. The pruning hook shown is one of the best tools I use. It is made from an eight-inch file and a broom handle, and cost 10 cents. The hook to cut easily must be V-shape, not round and the blade should be sharp nearly to the handle. The shuttle A can be cut from a thin piece of wood in a few minutes with a keen penknife and we can work much faster with it. It is about eight inches long by 1½ inch wide. The string is thrown over the center pin, brought through the notch at the bottom, then over the pin from the opposite side, alternating from side to side, and with a little practice may be wound full of string very quickly. One of the great difficulties in following this system is that many allow too much bush to grow and then cannot bear to cut out the big strong canes. In that case I would cut out all I could, and then hire a man to cut out half of what was left while I went to call on my neighbors.

Pennsylvania. B. V. EGBERT.

SUCCESS WITH AN OIL TRACTOR.

I have used tractors for plowing for three years. The soil is semi-gumbo, much covered with "rip-gut" and swamp smartweed. Roots of the latter were three-quarters inch through and as many as 13 to the foot. It was killing on four horses weighing 2,050 pounds each, to pull a 14-inch bottom. I first tried steam tractors. They did not pay. They required a man to steer, one to fire and one on plows (three 16-inch bottoms) and a man and team to haul water, which was required every mile and took time to get aboard. Then a gasoline tractor which was an improvement and made better time, but finally bought an oil tractor, 27 horse-power and find it the thing to do the work. We use it to plow, disk, reap, mow, thrash, bale, run silage machine and saw. Plowing, two men are necessary for perfect work. When it is filled with 20 gallons coal oil at eight and one-third cents per gallon, and 20 gallons water and one gallon lubricating oil we are ready for a steady go till 6 p. m., when two more men come out, having had their supper, with team, wagon and one barrel water and one barrel oil and a lunch for midnight; light an acetylene headlight and plow until 6 a. m., when the day crew comes on. Thus we plow 23 out of a possible 24 hours when the land is just in right condition, and get crops in at seasonable times. Three plows in wild grass and six in stubble, plow about 12 to 24 acres daily. For seeding oats on corn ground it pulls three disks heavily loaded and two loaded tooth harrows on fast gear. It lessens number of horses kept one-half.

The steering apparatus has no chains to tighten, then loosen and tighten the other one, but is a simple screw that the front wheels obey instantly. Two tablespoonfuls of gasoline starts you. Pull the levers and your feed bill stops until you want to work again. It eats only when at work. It plows better than any horses can and at a more regular gait, forms furrows 10 inches deep, 16 inches wide. Wait until ground is in condition, thus securing better seed bed and better crop. J. E. M.

Elmer, Mo.

MARCELLA, who had been gazing out of the window, suddenly began to laugh hysterically. 'What in the world is the matter, child?" asked her mother. "When I finished my carpet rug," Marcella explained, "I folded it across my lap and carried it that way down the street to show it to Rosemary." "Well, what of it?" "That was only three days ago," gasped Marcella, with a renewed outburst of merriment, "and now nearly every girl in the block is wearing a carpet rug muff."—Judge.

He's Big All Over
And Good All Through

Big Ben is built for *endless* service. He has no "off-days," no shut-downs. His four years of existence have been one long record of on-the-dot accuracy. 20,000 jewelers say that he does more *efficient work* for less pay than any other clock alive.

A Big Ben battalion, over 3,000 strong, leaves La Salle, Illinois, every day. Their sparkling triple nickel-plated coats of implement steel; their dominating seven-inch height; their big, bold, black, easy-to-read figures and hands; their big, easy-to-wind keys—all make Big Ben the world's master clock.

In return for one little drop of oil, he'll work for you a full year. From "Boots on" to "Lights out"—365 times—he'll guarantee to tell you the time o'day with on-the-dot accuracy.

He'll guarantee to get you up either of TWO WAYS—with one long, steady, five-minute ring if you need a good big call, or *on the installment plan*, with short rings one-half minute apart for ten minutes, so you'll wake up *gradually*, and he'll stop short in the middle of a tap during *either* call if you want to shut him off.

Big Ben is a mighty pleasant looking fellow. His big, open, honest face and his gentle tick-tick have earned him a place in thousands of *parlors*. He wins friends everywhere.

The next time you go to town call at your jeweler's and ask to see Big Ben. If your dealer hasn't got him, send a money order for $2.50 to his makers —*Westclox, La Salle, Illinois*—and he'll come to you prepaid. (206)

Save Half the Cost
Of Digging Ditches

Don't *dig* them out—*blow* them out. "The cost of making ditches with explosives is less than half the cost of hand digging," says the Michigan Experiment Station. You can do the work yourself, making a ditch 3 to 4 feet deep, 5 feet wide at top and 3 at bottom for 3 to 5 cents a running foot, with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

Put in a row of holes, load, fire and the work is done—as much in a day as a dozen men could dig in a week. The soil is spread over the land, not heaped up to occupy valuable space. The Atlas ditch is smooth and satisfactory.

Atlas Farm Powder is economical and easy to use. Get it for stump-blasting and boulder-breaking. Improve the fertility of your land by breaking up the subsoil. Set fruit trees in blasted holes, to get thrifty, early-bearing orchards.

Send Coupon for Valuable Book—FREE

Our book, "Better Farming," shows you how you can make your farm yield more profitable crops and how you can do many kinds of work quickly, cheaply and easily with Atlas Farm Powder, the Safest Explosive. Mail the coupon now.

My! What Large, Luscious Strawberries
That's what they'll exclaim and then quickly buy—at a good price—all such delicious berries you can produce. It pays to raise large, beautiful true-to-name standard varieties of berries such as
ALLEN'S Strawberry Plants Yield So Heavily
Your success is assured if you start right with ALLEN'S hardy, prolific, correctly grown berry plants. All the early and late strains of standard varieties for every soil and climate requirement. Over 120 acres devoted to strawberry culture alone at the ALLEN Nurseries, 29 years successful experience growing berry plants of the best quality.
Shipments Prompt and Guaranteed in Good Condition
ALLEN'S plants are carefully selected and packed for shipment. They are **fresh** and guaranteed **true-to-name.**
Send for ALLEN'S 1914 Book of Berries
It's full of valuable information to fruit growers. Lists and describes Allen's complete line of Strawberries, Raspberries, Blackberries, Currants, Grapes, Asparagus, etc. Tells how to grow small fruit profitably. A copy will be sent FREE. Write today.
W. F. ALLEN, 72 Market Street, Salisbury, Md.

THE PRUNING OF APPLE TREES.

PART III.

When using the shears keep the blades next to the tree or limb you are removing growth from and you will do a clean job. Always cut close. If you wish to know the reason for this just go to the tree itself for your answer. Now for a few hints that will help you interpret the plain English the trees have been shouting for ages.

There are six sections or parts to a limb or twig. Starting from the center we find first the pith, second the xylem or wood as we call it, which forms the bulk of the limb and carries the crude sap from the roots to the twigs and leaves; third, the cambium layer which contains the growing cells; fourth, the phloem, which conveys elaborate sap from the leaves to any part of the tree needing the food; fifth, the cortex, which contains the green substance called chlorophyl, which is one of the factors in the elaboration of the crude sap; sixth, the epidermis, which covers and protects the inner cells. You will readily see that when a cut is made on the side of a limb the material to cover it must come from the leaves above the cut. The tree in growing tends to form direct passages for sap from leaves to roots, thus making the lines of growth flow around such obstacles as side limbs or stubs. When the side limb is removed close to the main limb or trunk, there will be a tendency to bridge over this cut so as to straighten the course of the sap. Hence you will find that most of the healing of a cut is done from the sides and very little at the top or bottom.

By studying a few old cuts one can see the importance of careful and close cutting. When pruning young trees it pays to use a little extra care and cut just above a bud pointing in the direction the future limb should grow. It will take very little, if any, more time and gives a much better shaped tree. It is not difficult to induce some trees to form open spreading heads, while others have such poor habits of growth that it is almost impossible to produce a well formed head. Golden Sweet and Williams Red are typical of the first class, while Duchess of Oldenburg and Yellow Transparent are among the worst of the latter. The Red Astrachan comes in as a happy medium and it is a real pleasure to prune such naturally well balanced trees. They need little pruning aside from heading in an occasional leading branch and keeping the center from getting too crowded.

The Williams Red gives an open though not a naturally well formed head, but owing to its tendency to continue growth in the direction the bud pointed, is not a difficult tree to train. The growth is moderate and stocky in South Jersey, giving a tree that is strong and able to hold a load of fruit with less breakage than some of the more upright growing trees. The Golden Sweet tree is also a spreading tree, and has a tendency to throw outside branches at right angles to the parent branch. The growth is apt to be slender if not pinched back once or twice during the growing season. It is easily trained into a very desirable tree. It has a habit of sending out water-sprouts on the trunk and main limbs. If these sprouts are not cut close to the tree from the start, more sprouts will start from the same place, and soon an unsightly and bothersome lump is formed, which will start a new crop of sprouts every time the old ones are cut off. This applies to sprouts on all varieties of trees.

The Yellow Transparent apple, while one of the most profitable to plant, will require some special treatment in pruning, as it is an upright grower, and is troubled with most of the diseases, owing to its weaker vitality. The writer has pruned a block of 1,500 of this variety for the past three years. These trees had had four years' growth without pruning, and when planted, had been pruned with four or five side branches and many with a center stem. These trees had also received much fertilizer and manure, owing to the fact that they were interplanted with rhubarb, and had made a rapid growth. These conditions were favorable to the spread of disease, and pear blight had secured a strong foothold. The trees in many cases had lost from one-quarter to one-half of the tops from this disease, and after pruning out all diseased wood, the remainder of the tree was pruned to leave the tree as symmetrical as possible. Where a central stem was found it was removed and all the larger cuts were painted. This work was done in July of 1911. The trees made some late growth, owing to the severe pruning, and were gone over twice more that season to remove blight, although little was found after the first pruning. The blight seems to do most of its work early in the growing season, or when the trees are making the most rapid growth, and if diseased wood is removed and burned as soon as it appears there will be little trouble from late infection, although if allowed to remain in the tree, it will spread rapidly. The disease seemed to be worse in thick trees, and on the north and east sides. This is another good reason for an open, spreading tree. Sunlight is a great factor in the prevention of disease.

The trees made a strong rapid growth in 1912, and were cut back during July of that year. From 12 to 14 inches of growth was left, and there was some late growth added to that. Very little fruit was set, owing to the rapid growth and lack of fruit buds. The severe pruning in 1911, late cultivation and an abundance of food forced many of the spurs into rapid growth, and prevented the development of fruit buds. The trees were pruned in July of 1913, and some trees were well loaded with fruit, requiring thinning in some cases, as this variety often sets five or six apples in a cluster. Very little cutting back was done this time, as the growth was nearer normal. One should be careful in cutting back the growth of this variety, as it generally sets fruit buds terminally on the branches as well as on fruit spurs. This terminal fruit not only helps to check the growth, but also helps to spread the tree. When rapid growth is desired the terminal bud is removed during the dormant season. These trees were also damaged and many were lost by the blight attacking the bark at the surface of the ground on the trunk. In most instances only patches of the outer layers of the bark were killed, but in some cases the disease had not only penetrated to the wood but had nearly, or entirely girdled the tree. Several trees were lost in this way. During the Summer of 1913, the trees were gone over and the diseased bark was removed, and the injuries treated with corrosive sublimate 1-1,000 strength. Where it was possible and the cambium layer was not dead, only the dead outer layers of bark were removed. The trees are not being stimulated so much now, and it is hoped that the treatment will check the disease. On some trees the disease seemed to have been checked naturally and the dead bark was being shed. It is too soon yet to tell whether the work was a success from a commercial point of view or not.

The Duchess of Oldenburg is also an upright grower, and has a habit of throwing out two shoots from the terminal bud in many cases, and nearly always forms a weak crotch. This makes it a difficult tree to keep in good form, but by careful work and study may be developed into a fairly strong tree. It has given more trouble in forming a strong framework than any other variety, owing to the weak crotches and its somewhat slender growth. R. B. GILMAN.

Boy Farmers.

On page 210, G. C. H. presents a problem for solving, and states that the oldest boy of the family, now running a farm, is 19 years of age. While I sincerely regret making any statement that might lead to this boy and the family losing their place, the facts seem plain that the solution of the problem according to my idea, is securing an experienced foreman. I have never seen a boy of that age who had had sufficient experience to take sole charge of a herd of cattle or a farm, and make it a paying investment. It would be unnatural for a boy's mind to comprehend sufficiently the importance of such a task. If there were expert farmers and expert stock men in the vicinity of whom he could ask and obtain information regarding every detail, partial success might be obtained. So much depends every day, however, upon "the hand that throws the grain," and practical experience, that the prospects would be much brighter with a competent foreman to help the boys along. J. HENRY RINES.

Maine.

You Should Read the Studebaker Proof Book

The writer of these words has been reading and preparing business literature for a good many years.

But he has never read and (he is sorry to say) he has never written as convincing a book as this Studebaker Proof Book.

The Studebaker Proof Book is simply a volume of evidence—evidence of the value contained in the Studebaker car.

He feels impelled to urge you to send for it.

And if you do send for it, he is willing to venture a prediction.

He is going to predict that you will buy a Studebaker car.

Turns an X-Ray on the Car

Because he is positive that you will recognize immediately, as he did, that this book is a book of Truth—solid, convincing, substantial Truth in every word, paragraph and page, from cover to cover.

Take the Studebaker FOUR, electrically started and electrically lighted, at $1050.

This Studebaker Proof Book doesn't mention the Studebaker FOUR by name except in the concluding page.

But every fact cited, every detail described, every process pictured, gives you an intimate idea of how that FOUR is built.

It turns an X-Ray on to the car so that you can see it very vitals.

It makes you appreciate perhaps for the first time, how marvelous that price of $1050 actually is.

You Appreciate the Studebaker FOUR

You realize that it couldn't be sold for that price if it were not for the size and scope, and the scientific closeness of Studebaker operations which he describes.

You appreciate, as you travel with him through the plant, what it means to get in this $1050 Studebaker FOUR —no less than 247 drop forgings instead of malleable iron castings.

You discover that not only the vital parts, but even the lamp brackets, body irons, seat braces are of steel, drop forged and heat treated in the Studebaker plant.

It begins to dawn on you why the Studebaker FOUR is lighter and yet stronger than the great majority of cars of equal carrying capacity.

Then you realize that the magnificent long stroke small bore motor in the $1050 FOUR is not only Studebaker design, but very much more.

It is Studebaker-built, down to the casting of the cylinders, pistons and upper part of the crank case, in one of the finest—if not the very finest—foundries in the world.

You learn that Studebaker steel is steel indeed—that every piece that goes into the FOUR has at least from four to six heat treatments.

You Almost See the Actual Operations

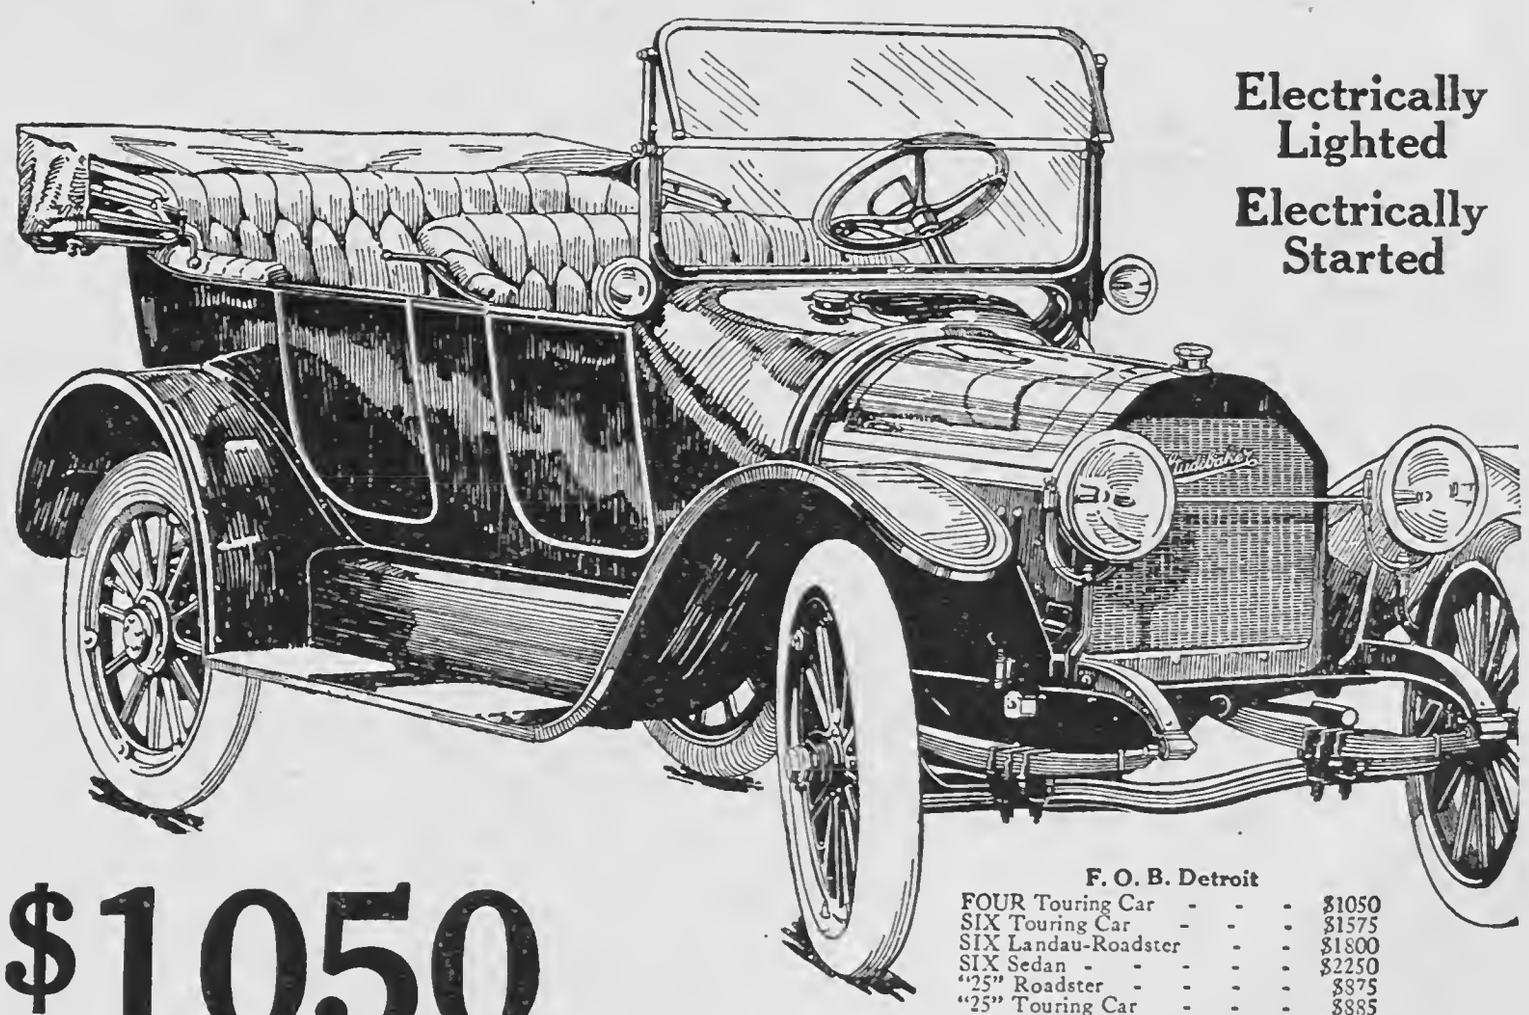
So step by step this graphic Proof Book takes you into forge shops, foundries, laboratories—shows you how the steel in the $1050 FOUR is tempered and tested for cam shafts, crank shafts, connecting rods, gear wheels, transmission shafts, etc., etc.

By word picture and photograph it describes the drastic test of Studebaker springs—the grinding and cutting of gears—a hundred things you ought to know, told in a way you can understand, and every word of which you will enjoy.

Trust the experience of one who has spent a life-time studying business literature—this is a book worth having.

Studebaker will send it to you if you'll ask for it on a postal card.

Studebaker FOUR



Electrically Lighted

Electrically Started

$1050

F. O. B. Detroit

FOUR Touring Car	$1050
SIX Touring Car	$1575
SIX Landau-Roadster	$1800
SIX Sedan	$2250
"25" Roadster	$875
"25" Touring Car	$885
"35" Touring Car	$1290
"35" Coupe	$1850
Six-passenger SIX	$1550

No "Four" made in America, at any price, comprises a greater proportion of manufactured parts than the Studebaker FOUR at $1050.

It expresses our judgment—after building 120,000 four cylinder cars—of all that a "Four" should be, all that it should do, *and the most that you should pay.*

At $1575 the Studebaker SIX is the lowest-priced "Six" on the market, and presents a value that is beyond comparison with any automobile in the world.

ARE THE PEACHES FROZEN?

About every Spring you can find people who will answer this question in the affirmative, whether the Winter season has been favorable to the life of the peach buds or not. Yet when the ripening season comes there are nearly always some peaches at least in places, and I have seen bumper crops after predictions of this kind. In fact I have made the same erroneous predictions myself, believing that most of the buds were Winter-killed, but was surprised later when enough live buds remained to produce a full crop. Truth is, it takes carefnl investigation to determine the exact conditions of the fruit buds on a tree before they begin to push forth in Spring, while to predict the extent of the fruit crop at this time is the merest guesswork, considering the injuries that may follow, such as Spring frosts, hailstorms, the June drop, Summer droughts, and the brown rot at ripening time. Counting chickens before they are hatched is no more uncertain than counting the peach dollars before the fruit is marketed.

It is of course quite possible to learn the life or death of an individual peach bud, even in mid-Winter, by simply cutting the bud crosswise about the middle with a sharp knife. If the entire cross section shows a healthy green the bud may be counted good. But if the extreme centre is brown or presents a "cooked" appearance, you can depend upon it that the bud is frozen. The buds probably turn brown after a thaw and warm sunshine. But even if you examine a dozen buds on a tree and three-fourths appear frozen, the next dozen may show a reversed condition. This especially if you simply cut a twig and examine all the buds upon it. In general the buds will be found in better condition on the higher branches than those on the lower ones. To get a fair estimate of the condition of a tree, select buds from every part of the tree.

Peach buds are not nearly so liable to be either Winter-killed or frozen by Spring frosts if the trees are located on a hillside rather than on bottom lands. Our orchards are up against the mountainside, where there is plenty of air drainage, and the woods above the orchards afford some added protection. The lowest temperature noted here this Winter was 10 degrees below zero. Farther down in the valley it was 18 below in places. Some buds are frozen here, but not enough perhaps to affect the crop seriously. Two years ago we had 14 below. Many buds were frozen, but still we had a splendid crop of peaches. The danger line is from 12 to 18 degrees below zero. Below this temperature one can scarcely expect many peach buds to come through alive. The difference in temperature because of elevation is not exceptional; it is a common occurence here. As a result it must be a very favorable season if our neighbors in the valley have any peaches.

While some peaches are grown almost all over the country except in the extreme North, there are indeed few places where peaches are entirly immune from freezing temperatures. Of course they are safe below the frost line, but this is far down in the State of Florida. Even in Northern Florida where we once resided, the peaches froze one year when about the size of hickory nuts. The peaches bloom there about February, and frosts sometimes, though rarely, occur later, so I think I should try a few peach trees, no matter where my residence might be, but would try to choose the most favorable location and the most hardy varieties. There is some difference in the hardiness of peach varieties. Among those I have tried I have found Belle of Georgia about the most hardy and Late Crawford the least hardy.

The peach is somewhat less hardy than other fruits except the apricot. It also blooms earlier than the apple, and generally a little earlier than the pear and plum; it blooms about with the sweet cherry, but later than the apricot. Thus it may be said that the peach is more liable to freezing than any other of the tree fruits except the apricot. Our losses here have not been as great from Winter-killing of buds as from Spring frosts, especially about blooming time. Last Spring when the peaches were in full bloom they were subjected to a temperature of 26 above one bright frosty morning. Something like four-fifths of the flowers were frozen. Trees produced about half a crop on the average. One year before the opening flowers stood 28 degrees with little injury, and 27 degrees one morning after the blooming period. They are believed to be the most tender while the nectar is in the open flower.

DAVID PLANK.

Pennsylvania.

Sowing Winter Rye in Spring.

Can I sow Winter rye in the Spring and cut it for hay later in the season? Some of my neighbors say that rye must remain in the soil all Winter in order to make a crop. S. J.

It is not the nature of Winter rye to produce its full crop when seeded in the Spring. It will make some growth, but not at all equal to the Fall-sown grain. There is a variety of rye specially adapted to Spring sowing. We have used an imported German variety, which when seeded at the time of oat seeding gave a very good crop, somewhat later than the Winter variety. But why sow any kind of rye for a hay crop? Rye makes poorer hay than any of the other small grains. Barley seeded in the Spring will give better feed than rye, and so will oats. Your best plan is to seed Canada peas and oats, as we have often described; cut them at the proper time and cure as hay.

Wood Ashes for Fruit; Reseeding Alfalfa.

1. Should I apply wood ashes around young pear trees, or would it be better to apply ashes around raspberry bushes and strawberries for best results? Is hen manure good for same berry bushes? 2. Will you advise me in regard to some Alfalfa I sowed with wheat last Fall. The Alfalfa came up but seemed all to shrivel up and die. Can I go over wheat with a weeder and sow more Alfalfa, about half amount I used first time, I mean sow the same as Timothy and seed clover is sowed? I do not like to plow wheat under. A. M.

LeRoy, N. Y.

1. The wood ashes will give you better results around the fruit trees. Do not use ashes on strawberries, though they give fair results on raspberries. Hen manure will be good for all kinds of fruit. 2. You will not obtain a good seeding of Alfalfa by scattering on the wheat. You can do this with Red clover, but Alfalfa will not "catch" so well. As the Alfalfa has failed it is most likely that the soil is not fit for it.

EVENTS OF THE WEEK.

DOMESTIC.—The Interstate Commerce Commission handed down a report March 6 containing serious charges against the management of the Chicago, Milwaukee and St. Paul Railroad. The report contains the following statements: That the income of the St. Paul road for 1910 was overstated by more than $5,000,000. That the St. Paul had misrepresented the cost of labor for the fiscal year ended June 30, 1911. That the income of the Puget Sound line was greatly overstated by means of "a variety of expedients." That the Puget Sound line included in its operating expenses no charges for depreciation of equipment. That the "fictitious showing" of income was used by officers of the Puget Sound company to aid in the sale of its bonds. That the Puget Sound company's report of property investment was $100,000,000 in excess of the cash investment.

Capt. H. C. Simmons and 16 of the crew of the coal steamer Charlemagne Tower, Jr., which sank off Barnegat, N. J., March 6, were landed at Norfolk, Va., March 7 by the steamer Bayport. The men were picked up from a lifeboat off the New Jersey coast five hours after they left their sinking steamer. Four other members of the crew, who put off in another lifeboat, were rescued by New Jersey life savers. All of the crew were saved.

Probably for the first time since the parcel post has been put in operation a coffin, for an infant, was sent through the mail, from New York to Englewood, N. J., March 8. The undertaker telephoned for the coffin and as the postage was only 18 cents found the new service much cheaper than by express or by sending a wagon to New York for it.

A four-foot water main running north and south under Fifth Avenue, New York, broke at the intersection of Broadway, Twenty-third Street and Fifth Avenue, March 8. The water tore away the earth to the west of the break without disturbing the pavement and broke into the sewer running through Twenty-third Street. Next the tremendous back pressure of the underground flood tore into the new Broadway subway excavation and filled the subway. Finally electric sparks caused gas explosions. Thousands of dollars worth of plate glass was blown out of buildings. A trolley car was banged so badly that eight passengers had to be treated by an ambulance surgeon. A column of flame fifteen feet through mounted high in the street for three hours. Great holes were torn in asphalt and block pavements and it was necessary to rip up much more good pavement before the flow of flaming gas could be shut off.

St. Luke's Protestant Episcopal Church, Clinton Avenue, Brooklyn, N. Y., one of the finest edifices in the borough, was destroyed by fire March 9. The flames also gutted the parish house and burned out two floors in the rectory. The damage was given as $400,000.

March 9 the U. S. Supreme Court refused to review the penitentiary sentences imposed upon Frank M. Ryan, president of the International Association of Bridge and Structural Iron Workers, and twenty-three of the association's members. The labor men were convicted technically of conspiracy to carry dynamite and nitro-glycerine on interstate passenger trains. In furtherance of this conspiracy it was charged that Ortie McManigal carried these explosives on such trains to Chicago, Tiffin, Ohio, Los Angeles and scores of other cities from coast to coast.

Fire in the building occupied by the Missouri Athletic Club, St. Louis, March 9, caused the death of 48 persons. A number of persons among these were transient guests who were not registered, and identification is difficult. It is said that warning had been given of unsafe conditions in the building.

The United States Circuit Court of Appeals handed down, March 9, a sweeping affirmation of the decision of Circuit Court Judge Hazel of Buffalo, sustaining the application and force of the so-called "Goodwin patent" to all the common types of films manufactured by the Eastman Kodak Company. Unless it is possible for the Eastman Kodak Company to carry the case up to the United States Supreme Court, the decision of the Court of Appeals means that the Eastman Kodak Company will have to account to the Ansco company for all cartridge films, film packs and cinematograph films made by it in the last fifteen years. The amount of money involved is enormous. The Ansco company controls the patent by virtue of controlling the Goodwin Film and Camera Company, which owns the patent. The original inventor of the pliable film, Rev. Hannibal Goodwin, a clergyman, who was experimenting to improve stereopticon views for his Sunday school, is survived by a widow of 86 and one daughter, who are in modest circumstances.

MESSAGE ON CANAL TOLLS.—March 5 President Wilson appeared before Congress and read a short message asking for the repeal of the provision in the Panama Canal act exempting coastwise American shipping from the payment of tolls. Mr. Wilson asserted that his reason for asking the repeal was that everywhere except in the United States the tolls exemption was regarded as a violation of the Hay-Pauncefote treaty, and he further asked it in support of the administration's general foreign policy. Because of the wide diversity of opinion, even among members of his own party, on the tolls question, Mr. Wilson's reception was not so flattering as that accorded him upon former occasions. Sharper criticism among members of Congress also followed the delivery of the message.

WEATHER AND CROPS.

Niagara Co. peach growers of this section claim that peach buds were killed by the cold weather in February. In different years past just as cold weather has been experienced and followed by a large crop, but this year the few live buds are found on the young tres. Many auctions owing to Spring changes. Horses are selling at $350 to $550 per pair; cows, canners $20 to $30; fresh $60 to $125, according to quality. Veal 10 cents pound; butter 20; eggs 30; pork 8½. No market for potatoes until the weather is warmer, as what few potatoes there are, are stored, usually in pits during the Winter. The trimming of fruit trees is well under way and farmers here anxiously await Spring weather. M. H. L.

Barker, N. Y.

We have had good Winter weather nearly all the month. The latter part has been extremely cold, the mercury going to 24 deg. below zero. Some have fears about the peach buds. I have examined a few and find them all right. Some have been trimming apple trees during the few warm days we have had. Not much else is being done but chores and attending auctions of which there are a large number. Cows are selling very high, also western horses which are being shipped in. Hopewell Grange has appointed several committees to purchase its supplies of fertilizers, spraying material, binding twine, etc. Stock of all kinds is doing well. It takes lots of grain and fodder. Wheat and meadow lands are well protected with snow. It has been hard work to get eggs during the cold weather. I see that many of the Granges are taking action against the Wilson bill in regard to widening sleighs. E. T. B.

Canandaigua, N. Y.

No fruit or gardening crops offered by farmers here. Potatoes sell for 32 to 38 cents now, according to variety. Triumph (seed stock) 30 to 35 cents here. Cows (milch) sell for from $50 to $70, and good pork brings 7¾ cents. Good veal nine cents, live weight. Oats 40 to 45; corn $14 to $18 a ton. Dairy butter 26. H. G. F.

Almond, Wis.

Oats 32; corn 50; rye 48. Choice Timothy hay $10 per ton baled (little or no demand). Butterfat 30 cents per pound. Milch cows, fresh or just coming, $50 to $75. Stock and feeding cattle $5 to $6.25 per cwt.; fat cows and heifers $5 to $7; corn fed steers $6.50 to $7.75; hogs $7.50 to $7.90. Fruits and garden truck are not enough raised for home consumption. This is mainly a live stock section, gradually turning to dairying, to which it is well adapted. Clover and other legumes adapted to this latitude grow here to perfection, while the nondescript type of cows are rapidly changing to good dairy type, through the use of purebred sires. M. B. C.

Amery, Wis.

Wheat 70; barley 50; rye 50; Scotch peas 80. Hay from $5 to $9 per ton, according to quality. Straw $4 per ton. Clover seed $7; oats 32; flaxseed $1.15. Eggs 24; butter, creamery, 30, dairy 22. Cheese from 17 to 17⅞. Horses from $100 to $250 and even $300 per head. Cows $50 to $90. Calves, live weight, eight cents; hogs, live weight, seven cents. J. N. G.

Algoma, Wis.

Studebaker wagon in five runaways—and still working

Mr. Andrew Kittleson, of Litchfield, Minn., bought a Studebaker Wagon in 1869. He is proud of his Studebaker, and his letter describing its long life of usefulness is so interesting that it would be difficult to write a better advertisement. Here is Mr. Kittleson's letter:

"I bought my Studebaker in November, 1869, at Litchfield from Flynn Brothers, and it has been continually used on my farm ever since. This wagon has given me perfect satisfaction. Never was there a lighter running wagon and it has been of no expense to me. It has hauled thousands of bushels of grain to market, over mighty poor roads.

"My Studebaker has been through five runaways. On one occasion the team ran half a mile and into some oak trees where horses and wagon hung until help came. Another time my team ran into a stone pile. One horse was killed but the wagon was uninjured. It seems to stand all it can get.

"When I built my home I loaded 5000 pounds of sand into my Studebaker. The carpenters were surprised that the wagon could stand such a big load. I am using this wagon at the present time and expect to use it for many years to come."

A 45 YEAR TEST IS PROOF ENOUGH

Don't let anyone sell you a farm wagon, at any price, with the claim that it is just as good as a Studebaker.

You can buy Studebaker Buggies and Harness that will give the same satisfaction.

502.6 Bushels Potatoes

From One Acre of Ground

TWENTY DIFFERENT FARMERS in 20 different parts of New England competed the past year in growing potatoes. The crops were widely separated as to climatic and weather conditions. Each one planted, cultivated and took care of his crop in his own way; *but all used*

Bowker's Fertilizers

And No Other Dressing

The winning crop was 502.6 bushels. The average of the twenty crops was 322.8 bushels. The average yield in New England is 131.6 bushels, and for the United States 89 bushels. Our crop-growing contests of the past four years have been so fairly and accurately conducted that they have been accepted everywhere as authentic. Henry Wallace, Editor of Wallace's Farmer, writes: "There is no guesswork about them."

Send for our Book of the Contest. Also tell us what your crops are, and your fertilizer requirements and we will send you our helpful book on Plant Food and our new Illustrated Catalogue.

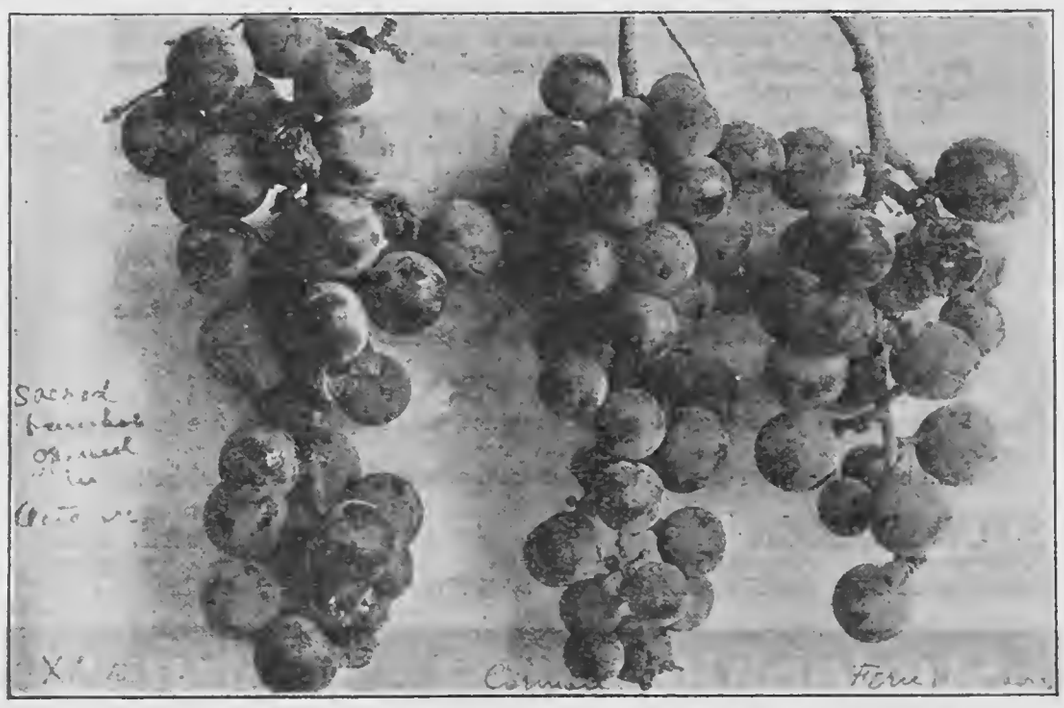
FRUIT FARM NOTES.

I have become greatly interested in the varieties of grapes originated by the late T. V. Munson of Texas, the greatest viticulturist of our time. There are a large number of these grapes, and while some of them are too tender for this latitude of southern Missouri, the majority of them are hardy not only here but much further North. While I regret that I am far from having a full collection of these new creations, I am fortunate in having a few of them that have borne one or two seasons. Last year I commented on the Wapanuka, estimating it as the best white grape in my large collection. It is decidedly superior to Niagara or Diamond. In size of cluster it is not equal (as few grapes are) to that well-known pair, but in size of berry and delicate coloring it excels them. While of honeyed sweetness it is not cloying to the taste, but has a subtle spiciness hard to describe. It is too tender for a long distance shipper, but can be carried over a good radius and of course is a great seller on local markets as a fancy table grape. The vine is of strong growth and quite productive. Although very thin-skinned I find this grape a good keeper. Another seedling I think highly of is the Mericadel, a cross (as name indicates) of the



SACKED GRAPES, OPENED IN OCTOBER. FIG. 173.

Munson wine grape America and the Delaware. This variety is unique in bunch and berry. The color is purple, the bunch long and slender and the berry a grade larger than Delaware. The vine is very vigorous and very productive (qualities of the America), but the quality of the fruit is its greatest asset, being high enough to put it in the class of choice table grapes. Its strong growth and heavy fruiting ought to make this variety of value for commercial planting. The skin is thin but tough, and it ripens a little after the Concord.

Another kind that gives promise of value is the Xinta, a cross of the America and R. W. Munson, both strong in the blood of the wild grape. I found this grape to succeed here much better than Mr. Munson's description would indicate. It is a fine black grape, fully as large in bunch and berry as Concord if not larger, while it is described as medium to large in the catalogue. It is not medium here, certainly, whatever it may be in Texas.

Its parentage assures it a high degree of vigor and prolificacy and its strain of wild blood gives it a piquancy not found in the Concord. It also has value as a late black, coming in a trifle behind Concord and hanging on persistently, a splendid keeper both on and off the vine. Mr. Munson calls it an excellent wine and market grape. To me it has a special value as a supplement to the Concord, furnishing a welcome variation in flavor and extending the season by its superior keeping qualities.

Still another variety, but one that has been extensively tested because of its early introduction, is the Carman. Despite its wide range of trial it has never, to my knowledge, gained any popularity in the North. This grape bore its first crop for me last Summer. I found its season quite late, carrying it on into the company of the very latest. Bunches are long with berries medium in size. When its fruit was finally ripe, I found it sweet and fairly good, but the seeds, for some reason, were unduly pronounced in the mouth, although they were no larger nor more numerous than ordinarily. The chief value I see in the Carman is in its late season, coming after all the usual standards. It is a fine keeper, and bunches that were sacked kept till long after frost. There is generally a good demand for any kind of fruits that come on late and prolong the season. That this grape has a much greater value in the Gulf States is proved by the statement of W. B. Munson that the demand in that region is so great as to absorb the entire nursery supply, and that it is increasing. In his original description Mr. T. V. Munson, the originator, says of it that it has a pure, rich quality, much superior to the Concord, and that the clusters are large to very large, occasionally reaching a weight of two pounds. That would not hold true here, judging from the first crop of a specimen vine.

Another of my Munson grapes is the Xenia, a large late white grape with very large cluster, equalling those of Niagara. The berries are large and very firm and meaty; quality peculiar but hardly equal to that of Niagara. Its value lies in its late season and showy clusters; it is the latest white in my collection.

The last of my list is the Fern Munson, a Post Oak-Catawba cross, and the latest variety to ripen on the grounds, ripening in September after Norton's Virginia. I think well of this grape as being the latest and largest of the season. It is a shade smaller than Concord and in color a very dark purplish red. It is of excellent quality and piquant in its wild blood. Its berries are nearly twice the size of Norton's, and are so very tenacious to the stem that it takes a good strong pull to get them off. Mr. Munson says it is free from the black rot and has endured 27 degrees below zero without injury. While this grape might ripen too late for the more Northern States, it and the Carman fill a real vacancy in the grape season of Missouri and the region south. A worthy companion to the Fern, and excelling it in size of cluster, is the Muench, a grape I have seen but once described to me in private correspondence by reliable growers. All in all, the Munson creations are the greatest contribution to grape culture ever made by the labor and genius of any one man. Every one I have so far tested has a definite place and value. The wild blood with which so many of them are crossed gives a most agreeable piquancy of flavor as well as superior vigor and productiveness. Of especial value are they in supplying the absence of good black grapes after the season of the Concord, an absence that was keenly felt. I feel that the command of the local market is greatly strengthened by the addition of these grapes.

L. R. JOHNSON.

Cape Girardeau Co., Mo.

A FEW weeks since a man called on a poultry keeper and inquired respecting a sitting of eggs. "Have you got your broody hen yet, Thomas?" asked the poultry keeper. "No," he answered; "but our old hen has broke her leg, and I thought she might as well hatch out some chicks as lay about in the run doing nothing!"—London Farm and Home.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

DIBBLE'S SEED FARMS 1600 ACRES

IS THE PLACE TO BUY FARM SEEDS

SEED POTATOES 60,000 bushels, 32 kinds, best early, intermediate and late Northern grown, full of vitality in any quantities from barrels to car loads and at a price you can afford to pay.

SEED CORN Best varieties, both Flint and Dent, either for crop or silo. Average germination tests to date over 95% and as low in price as $1.50 per bushel. Send for samples. Test them yourself.

SEED OATS Dibble's Heavyweight enormously productive with heavy grain. One customer reports 117 bushels per acre. Another—"Grain weighs 44-46 pounds per bushel."

Twentieth Century, a good standard extra early. Oats are cheap this year a bumper crop in our section. Samples free,

WE PAY THE FREIGHT

DREER'S 1914 Garden Book

THE amateur will find just the information needed to make his garden a success—over one hundred clear, concise, dependable cultural instructions for growing almost every flower and vegetable worth bothering with.

The list of worthy novelties and old favorites is complete and dependable. Especially important are the sections devoted to Roses and Dahlias. The collection of Hardy Perennials is the largest in America. Selected strains of standard vegetables and flowers.

Mailed free to anyone mentioning this magazine.

Dreer's Superb Asters.—The finest strain, either for garden decoration or cutting. Packets contain enough seed to produce more than one hundred plants. Made up of eight beautiful colors. Ten cents per pkt. DREER'S GARDEN BOOK with each order.

HENRY A. DREER 714 Chestnut St. Phila.

APPLES ON LONG ISLAND.

PART III.

Fanny: trees good growers, fruit red, medium good quality, season late Summer, bears well biennially, not desirable.

Gravenstein: trees fair growers, fruit striped red, fine quality, good bearer, season Summer; desirable.

Gano: trees good growers, fruit red, similar to Black Ben Davis, quality fair, productive; not as desirable as Ben Davis.

Grimes Golden: trees fair to poor growers, fruit large, yellow, quality fine, season late Fall, productive biennially, recommended for a yellow apple, especially for home orchards, desirable for commercial use.

Rhode Island Greening: trees good growers, fruit yellow, large, fine quality, productive on older trees, one of the best apples for main trees, though it comes in bearing late.

Northwestern Greening: trees good growers, fruit yellow, large, bears well biennially, not near as desirable as Rhode Island Greening.

Newtown Spitzenburg: trees good growers, fruit small, red, season Winter, produces well but not desirable; sometimes planted for Esopus Spitzenburg; beware of this.

Hubbardston: trees good growers, fruit red, large, good quality, productive, desirable for either main trees or filler.

Ingram: trees fair growers, fruit red, medium to small, fair quality, productive, season Winter, desirable as filler only, as it bears young.

Jefferis: trees good growers, fruit red, medium size, good quality, productive, season Fall, desirable as filler only.

Jonathan: trees good growers, fruit red, medium to small, best quality, productive, season early Winter, very desirable as main trees or fillers, as it bears young.

King: trees good growers, fruit large, red, fine quality, poor bearers when young, but promises well as trees grow older; desirable as main trees only.

Longfield: trees fair growers, fruit yellow, small, season Fall, very productive; not desirable.

Long Stem: trees fair growers, fruit yellow, small, not desirable.

Lawver: trees good growers, fruit red, size medium, fair quality, not desirable.

Lord Suffield: tree poor grower, fruit yellow, large to very large, fair quality, season Fall, not desirable.

Maiden Blush: trees good growers, fruit yellow, medium to small, good quality, season Fall, desirable as filler as bears young.

McIntosh: trees good growers, fruit red, medium to large, fine quality, productive, desirable as main trees and as fillers.

Mammoth Blacktwig: trees good growers, fruit red, medium, poor quality, not desirable.

Missouri Pippin: trees good growers, fruit red, small to medium, very productive, bears young, desirable as filler only; quality fair, late keeper.

Monmouth Pippin: trees good growers, fruit yellow, not productive, medium to large size, not desirable.

Martha Crab: trees fair growers, fruit red, large for crab, good quality, desirable as crab apple.

Mann: trees good growers, fruit green, poor quality, small, not desirable.

Newtown Pippin: 30 trees planted Fall of 1902, no apples yet; poor grower, some good trees in neighborhood but not large or productive; not desirable.

Northern Spy: trees fairly good growers, but practically no fruit yet; fruit red, large, fine quality; trees have no appearance of setting fruit yet; desirable only for main trees.

Oliver: trees good growers, fruit red, medium to small, irregular, poor quality, shy bearer, not desirable.

Ohio Nonpareil: trees good growers, fruit yellow with red, large, season Fall, shy bearers; not desirable.

Pewaukee: trees good growers, fruit red, medium to large, fair quality, not heavy bearer, good but not desirable.

Porter: trees fruit growers, fruit yellow, fair quality, medium to small, productive, late Summer apple, tender; not desirable.

Primate: trees fair growers, fruit medium to large, fair quality, productive, season late Summer, sweet; not desirable.

PETER ELBERT NOSTRAND.

The Cadillac Company has no intention of marketing a six cylinder car

THE Cadillac Motor Car Company has always believed that there are so many good features in the Cadillac Car, that its advertising space could be best utilized exclusively in acquainting the public with those advantages.

We regret, however, that the occasion arises which makes it appear desirable for us to depart, temporarily, from that policy.

Inasmuch as it is not possible for us to control the "mouth to mouth" advertising with which we are favored, and inasmuch as that gratuitous publicity may sometimes contain elements of inaccuracy, unintentionally perhaps, on the part of the authors, we feel that we would not perform the duty which we owe to the public and the duty which we owe to ourselves, if we did not correct any misunderstandings or misconceptions which may exist concerning the methods, policies and plans of this company.

The pre-eminent position of the Cadillac Car as the "Standard of the World," its recognition as the criterion of excellence in practical construction, are not matters of mere chance.

For eleven years the Cadillac has been manufactured and marketed upon well defined principles. Adherence to those principles has been the dominant factor in Cadillac success.

The Cadillac has never aspired to ideals set by others; it makes its own ideals and raises them higher and higher.

The Cadillac has never striven after the achievements of other plants; it is a school and a model unto itself.

The Cadillac has never been obliged to make apologies for its product. It has never been obliged to smother its past, nor to discredit it by wiping the slate clean and beginning all over again.

The immaterial and the impractical, the fad and the fallacy, the delusion and the shallow "talking point" have no chapter in the "Story of the Cadillac."

The "Story of the Cadillac" is the story of that mechanical and commercial advancement which makes for permanency. The Cadillac product has been only that which its makers knew to be right; that which its makers know would satisfy and give to the purchaser "value received" in abundant measure.

The policy of the Cadillac Company has ever been to avoid exaggeration and overdrawn statements. Its policy has ever been to under-claim rather than to over-claim.

The Cadillac Company is gratified that the public feels secure in accepting Cadillac representations at their full worth. These representations are so accepted because the Cadillac Company has never misled and because the public could always expect and has always received more than was offered.

The Cadillac Car of to-day has behind it the experience gleaned in the successful production of the seventy-five thousand Cadillacs which have preceded it—by far the greatest number of high grade motor cars produced by any one manufacturer in the world.

The Cadillac Company is ever alert—its ear is ever to the ground; it feels the throb of the public pulse. Yet never has it yielded to clamor by giving endorsement to principles which would take advantage of the uninitiated or the uninformed, even though temporary benefits might accrue.

The experimental division of the Cadillac Company is not excelled in the motor car industry. We do not believe it is even equalled.

Every design, every appliance, every idea, every principle offered which has a semblance of merit, is subjected to the most gruelling tests.

For every idea or feature adopted or considered worthy of the Cadillac seal of approval, scores are discarded.

One reason why most of the new ideas of inventors and manufacturers are first offered to the Cadillac Company is because these inventors and manufacturers realize that with the Cadillac seal of approval their future is practically certain.

As an example, take the electrical system of automatic cranking, lighting and ignition, first introduced by the Cadillac Company and now used almost universally.

Take also the two-speed axle introduced into the present Cadillac, and which engineering authorities on both sides of the Atlantic are predicting will soon come into general use.

Witness this from "The Automobile Engineer" published in London, England. In commenting upon Cadillac engineering progress and Cadillac initiative, it says:—

> "Already there is a very decided movement among other makers to try and provide some type of two-speed rear axle similar to the Cadillac, for 1914 or 1915."

In our experimental division we have built automobile engines of almost every conceivable type and size, and have tested scores which we did not make ourselves.

We have built them with one, with two, with three, with four and with six cylinders. We have never tried five.

We have cast them en bloc, we have cast them in pairs and we have cast them singly. We have made them with water jackets cast integral and with copper water jackets. We found the latter method most expensive ,but the most efficient—hence we use it.

We built cars with one cylinder engines, more than 15,000 of them, and they were good ones. "One-lungers" they were called, and they are practically all going yet, after eight to eleven years of service, hundreds of them having passed the 100,000 mile mark.

We built a few cars with two cylinder engines and they were as good as that type could possibly be made. But we never marketed any of them although the rumor was current that we intended doing so.

Yes, and we built cars with three cylinder engines, as good of that type as could be made. Probably few readers ever heard of such a car. Some people thought they wanted that kind and they bought them. But not from us. Rumor had it, however, that we intended to market them.

Cars with four cylinder engines! We have built and distributed more than sixty thousand (60,000) of them. That was something more substantial than a rumor.

Cars with six cylinder engines! We have built a number of them in the last four years. We have tested them to the utmost, and they proved to be good ones—by comparison. In fact, by comparing them point for point with a number of the most highly regarded "sixes," which we bought for the purpose of making comparisons for our own enlightenment, we failed to find a single car which, in our opinion, outpointed our own, and our own outpointed most of them.

These experiments may have given rise to the rumor that the Cadillac Company contemplates marketing a six cylinder car. But—as in the cases of the two and three cylinder cars—such rumor is entirely wtihout foundation. This Company has no such intention.

And we made other comparisons as well; in fact, nothing worth while was overlooked or omitted.

Our tests, investigations, experiments and comparisons demonstrated conclusively to us, that a four cylinder engine, designed with the skill and executed with the precision which characterizes the Cadillac engine—and scientifically balanced, affords the highest degree of all 'round efficiency possible to obtain.

These tests further demonstrated that with such an engine, in conjunction with a properly designed two-speed axle, there is obtained an extraordinary range of operating flexibility, an extraordinary reduction of friction, an extraordinary degree of operation and maintenance economy, an extraordinary degree of luxurious riding qualities, and a reduction of vibration, particularly at high speeds, almost to the vanishing point.

We have cited the foregoing facts because we believe that the public is entitled to know them, because we believe that we owe it to the public to make the facts known and because we want the public to know that the Cadillac Company leaves no stone unturned, that it spares no expense in its efforts to discover and to provide that which it knows to be right, that which it knows will satisfy, and that which will give to the buyer "value received" in abundant measure.

And above all, the Cadillac Company has no intention of departing from that policy.

There can be no better evidence of the appreciation of the Cadillac policy than the fact that there have already been manufactured and distributed more than 9,000 of the 1914 Model Cadillacs, amounting in selling value to more than eighteen millions ($18,000,000) of dollars—a volume of cars which nearly equals, if it does not exceed, that of all other 1914 high grade American cars combined, selling at or more than the Cadillac price, regardless of their number of cylinders.

How To Make Your Garden Thrive and Mature Early

The kind of plant-food required in your soil depends on the kind of a crop you are to raise. In order to make your garden produce its maximum yield at the lowest cost for fertilizer you should supply only those elements which are immediately available and which will be absorbed by the plant.

Consumers Brands

For Gardeners, Fruit-Growers, Florists and General Use

Comprise special distinct compositions of plant-food elements for vegetables, small fruits, root-crops, flowers, greenhouses, lawns and tree-crops. They supply only the constituents your particular soil needs for some special crop. For example our

Early-Crop Odorless Fertilizer

supplies your soil with the four plant-food elements in immediately available form needed by vegetables and small fruits for quick growth and early maturity. It is the most effective and convenient fertilizer you can apply for such crops and in the end the most economical.

Write today for our *free* Fertilizer Booklet—It is full of valuable information and is as valuable as a text-book on soil fertility.

Special Parcel Post Offer

Our Mak-Gro Odorless Plant Food is a clean high grade granular fertilizer for indoor and outdoor use on potted plants, flowerbeds, small fruits, lawns and small gardens. It is *made especially for the amateur* and is pleasant to apply. We will mail a five-pound bag to any address for $1.00. Write today for special circular.

WHITE PLAINS -:- NEW YORK

Some Common Garden Pests.

Every year we have several "bugs" show up in the garden with about the same regularity as the Fourth of July (and incidentally about the same time), and each time they do appear, we are sure to have occasion later on to regret their appearance.

WIREWORMS.—For some years now it seems as though wireworms were more than usually abundant. They are, as are also white grubs, strictly an underground pest. There are several species of them, but unfortunately for us, the most common are those which attack our crops. The insect's common name is quite appropriate, as it has a distinct wirelike appearance and feel. It is from one-half to an inch long, hard, smooth, shiny, and yellowish in color. The parent is the so-called "click beetle" or "snap bug," that little fellow which jumps up in the air with a distinct click when you turn him over onto his back. From two to three years are required for full growth from the egg to the mature insect, and most of this time is spent underground. Potatoes seem to suffer more from the attacks of wireworms than other crops. Possibly this is because potatoes are more generally grown than other vegetables and the injury is therefore more noticeable. However that may be, such vegetables as turnips, carrots, beets, onions and lettuce are also subject to attack. The worms usually eat the smaller tubers, frequently boring holes through the underground part of the stalk.

Many remedies have been suggested, but none has been found to be entirely satisfactory. The fact that they ordinarily breed in sod ground suggests a remedy, or rather a preventive, in rotation of crops. It has been found that wireworms do not attack clover and related plants. Therefore they may be starved out by planting clover on ground that has been infested heretofore. Vegetables can follow clover with comparatively little danger of attack. Fields which have been in grass for a time and are plowed and planted to some vegetable are especially apt to be troubled with wireworms. Fall plowing is also of some value. By this means the over-Wintering adults and "pupæ," or immature insects, are exposed to the action of the weather and the attacks of birds. It is always a good scheme to allow chickens to follow along after the plow, as they will pick up quantities of insects such as white grubs, wireworms, and cutworms. Because of the hardness of their skins, the worms cannot be killed by insecticides. Any application strong enough to penetrate through them would also kill the plants and render the ground unfit for use for some time to come.

CABBAGE WORMS.—The cabbage worm has always been and still is one of the worst pests of cabbages. There are few gardeners who have not had some experience with it. The worm itself is velvety green in color with a faint white line down its back, and about an inch and a quarter long when full grown. Hatching early in the Spring, it attacks the young cabbage plants, eating the outer leaves. As the head of the cabbage forms, it is also attacked, the worms hiding in it and disfiguring it with their excrement. Their parent is the familiar cabbage butterfly, white with two black spots on its wing. It may be seen hovering about from early Spring to late Fall. Soon after they appear the adult butterflies mate and the females lay their eggs, generally, on the undersides of the leaves; these eggs hatch within a few days and so the process goes on. Since there may be several broods or generations per season, depending on the locality, it is easy to see why they are such a pest. It is quite possible to get rid of them by the use of a poison such as Paris green or lead arsenate, to which a "sticker" has been added. A sticker is necessary because of the waxy surface of the cabbage leaf, to which the ordinary spray will not adhere. A pound of resin dissolved in 50 gallons of spray material will make it stick. The poison should be applied as soon as the worms appear, and as often afterward as appears necessary. But the careful man will say he doesn't want to put on poison a few days before he expects to eat that cabbage. He would rather take what the worms leave. If it is necessary to put on poison a short time before the cabbage is to be used, try hellebore. That will lose its poisonous qualities after a few days' exposure to the air, and there will then be no danger from it. Poisoned bran mash, as is used for cutworms, may also be used to advantage for the cabbage worm. Small quantities may be made by mixing a quart of ordinary bran with a teaspoonful of Paris green, and moistening it with half a cup of water to which has been added a tablespoonful of molasses. The poisoned bran should then be scattered over the affected plants.

CUCUMBER BEETLES.—Early in the season cucumber, squash and melon plants are often attacked by black and yellow striped beetles, known as the striped cucumber beetles or "melon bugs." Although the roots are damaged to some extent by the "larvæ" or grubs, slender white worm-like creatures, the greatest damage is done by the bugs themselves. They devour the tender plants almost before they are well started. The older plants also suffer from their attacks, the beetles eating the leaves and gnawing the rind of the stem and fruit. They are also said to carry a harmful bacterial disease, known as the "cucubit wilt." The beetles usually appear early in April or May, feeding on all kinds of vegetation until the squashes and melons are set out, when they injure them in the manner already described. Eggs are laid on the leaves and in the ground, just under the surface. The grubs hatch and spend that period of their existence in the stems and under the surface of the ground. When the nights begin to get cool, the beetles have a habit of collecting under the stems and wilted leaves wherever they can be sheltered, sometimes as many as 50 under a single plant. They spend the Winter hidden away under leaves and any kind of rubbish.

Another beetle similar in many respects to the striped cucumber beetle is the twelve-spotted cucumber beetle, so called because of the 12 black spots on its back. It injures the plants in the same way, and although commonly found associated with the ordinary cucumber beetle, is generally less abundant. Both of these bugs are handled in the same way. Coverings are often used on young plants to protect them from injury. A barrel hoop is cut in half and the two pieces fastened together at right angles to each other with the ends stuck in the ground, forming an arch each way over the plant. The frame thus made is covered with cloth or wire, preventing the bugs from getting at the plants. Another way is to plant an excess of seed, so that when the bugs get what they want there will still be a little left for the owner. But that is not a way that will appeal to the man who has any respect for himself. Spraying with arsenate of lead at the rate of four or five pounds to 50 gallons of water gives considerable protection, but it will not get all the beetles; some will hunt out places not covered by the poison, such as under leaves or inside the flowers. Repellants have often been advised, but when the beetles are at all numerous they are of little avail. The best of these is dry or air-slaked lime mixed with flowers of sulphur and dusted on the plants. The planting of early beans or squashes will help, as traps. But one of the best ways is to destroy all old vines, dead leaves, and anything else that will serve as a hiding place for the bugs during the Winter. This will help to be rid of them during the following season.

New Hampshire. C. H. HADLEY, JR.

Oat Hay.

We planted only corn last season, and we have no hay. Would it be wise to plant oats for an early cutting, or is there some other method by which we can get early hay? We have about a ton of chicken manure. Would it be best to put it on cabbage or on pickles?

M. B.

We should sow oats and Canada field peas, as we have so often described, to cut for hay. Plow the peas under and harrow in the oats. The chicken manure is well suited to fertilize the pickles.

"EVERYBODY has some secret sorrow," says a philosophising friend. "Even the fattest and jolliest of us has a skeleton in his midst."—Credit Lost.

Hard Times Mean Big Savings To YOU!

Over 500 big manufacturers have been hard hit by bad trade conditions this year. They made too many goods. They needed money badly. We bought their surplus goods at less than cost to manufacture. We paid them just about the cost of the material alone, and we offer you these brand new up-to-date goods at a good deal less than cost to manufacture! Sure, we make a profit. Just 4 cents on every dollar you spend. But other catalog houses have to pay a good deal *more* than *our actual selling price* to buy such goods, under ordinary conditions. Bankrupt concerns sell *cheap* and many of our manufacturers would have gone bankrupt if we had not traded them *cash* for *goods*.

We Bought at Our Own Price And the Saving Is All Yours!

Our own profit has not been increased a cent. Every bit of the big reduction in prices goes to our friends.

And we have not a single old, second-hand or out-of-date article in our entire nine acres of floor space.

Think of it! Nine acres piled to the roof with the finest kind of merchandise, which we are selling at less than cost to manufacture.

Why, man, if you were running a store, you could buy fresh new high-class goods from us today at less than you have to pay your wholesale house for the same goods.

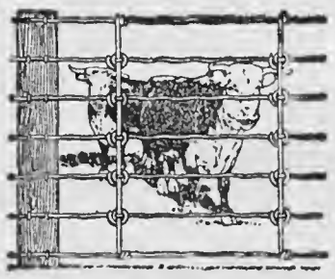
If the Goods Aren't Right— It's No Sale

Don't take our claims on trust. You may not know us or our business methods. Until you do know our reliability we are glad to take all the risk.

Here's a fair offer. Get our catalog. Pick out your goods and order them. Look them over when they come. Ask your local dealer what his price is on the same kind of goods.

If our prices are not lower on the same quality, we take back the goods and refund your money.

Get the Fencing that Lasts



If you want a fence that will hold up under all conditions, don't buy before you get our big fencing sheet.

We have several thousand rods of the best grade of fencing that is made. Heavy pure steel wire, triple galvanized. Patent lock joint that cannot slip and will not rust like twisted or welded joints. This fencing would cost you more money direct from the manufacturer than we ask for it.

Get your order in quick before our stock is sold out.

Every piece of wire in these fences goes through a patented process which leaves a perfectly smooth surface for our heavy galvanizing.

Our big fencing sheet will tell you the best fence to use and give you a price per rod laid down at your railroad station. Our list of heavy all No. 9 fences will last a lifetime if stretched properly.

26-Inch Hog Fence, 17c Per Rod; 32-Inch Hog and Sheep Fence, 18c Per Rod; 4-Foot Field Fence, 22c Per Rod.

Send for Special Sheet! Get Our Delivered Prices!

Best Paint, $1.06

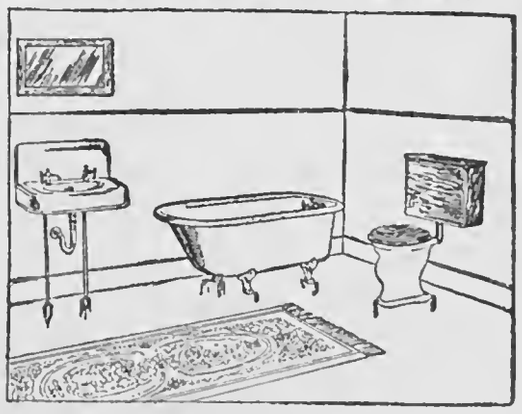
Get your paint now, so as to have it ready when you need it in the spring. We offer to the first comers 3,500 gallons of specially mixed "farmers' paint," made to stand the extra hard wear that paint undergoes on the farm. Don't miss this opportunity. Order quick if you want the best farm paint ever made, at 44c less than you would have to pay at wholesale.

Reports from 176 of our customers show that Buffalo Farm Paint will cover 525 sq. ft. of wall or floor. Other paints of equal service cover only 400 sq. ft.

Our paint department is one of the largest in the country, and includes brushes, stains, varnishes—in fact, all painters' supplies, at bargain prices.

House Paint, $1.06 Per Gallon, in 5-Gallon Cans; Barn Paint, 78c Per Gallon; Cold Water Paint, inside, 6c Per Pound—outside, 9c Per Pound. SEND FOR LARGE COLOR CARD.

Bath Room Outfits



Sanitary plumbing today is a vital question all over the country. For years we have been installing complete outfits everywhere. Every piece, from enameled ware to pipe, that leaves our warehouses is guaranteed perfect. You don't get chipped or seconds when you buy of us. No mechanic is needed to install our outfits, as we can furnish all iron pipe connections and full instructions.

Let Us Install Your Water System

We make a specialty in water systems. Just tell us you want one and our engineers will do the rest, giving you size and all instructions for installing FREE. Our system is made extra heavy throughout, and you can rest assured, with a Buffalo Water System in your home, you never need worry.

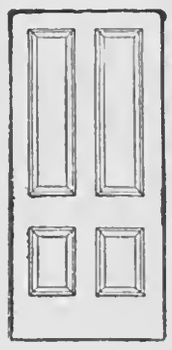
Wall Board

This wonderful substitute for lath and plaster is becoming so well known that no further description need be given. Improved Buffalo Wall Board makes your home warmer in winter and cooler in the summer. Easy to put on. You just tack it to the studding or over old plaster and paper. Weighs so little the freight is practically nothing. Send us your room plan and we will give you a price delivered to your station. We have over a million feet bought, all of which we offer at $2.35 per 100 square feet or $22.50 per 1,000 square feet. Don't delay—write us today.



MILLWORK and LUMBER

Everything in the building lines can be found in our BARGAIN BOOK. We will sell you material for an entire building, freight paid to your town, and give you a saving big enough to pay the entire labor cost of building. All A-1 new stuff and all guaranteed.

In this book all the material is listed at prices your wholesale dealer would have to pay. Don't be misled about freight charges, as we will give you delivered prices to your station on everything and show you where you can save big money.

Our building department includes nails, shingles, lath, siding, hardware, doors, windows and all inside and outside trim. (44)

SEND US YOUR LUMBER BILL

RUBBER ROOFING, 59c

We take the entire output of remnants from four large factories. Just think of it—a rubber roofing at 59c a roll, the lowest price ever quoted for this quality roofing. Guaranteed to resist heat, fire, water, snow, hail and acids. No painting is needed; easy to lay as a carpet; no tools required but hammer. This roofing in the 2-ply comes at 83c per roll.

Queen City Rubber Roofing

This is the best rubber roofing made. Only pure asphalt and wool felt is used, which are acknowledged the best water and weather proof roofing materials on the market today.

1-Ply, Guaranteed 5 Years, $1.03; 2-Ply, Guaranteed 10 Years, $1.30; 3-Ply, Guaranteed 15 Years, $1.60.

Other grades on our big delivered price sheets.

STEEL ROOFING

Owing to slack business this year several large steel mills are heavily overstocked. We have taken the surplus of four of them, and our prices on steel roofings are the lowest in years. Don't think of buying any of this material until you have seen our delivered prices. For quality and prices we beat the world on steel roofing.

AN APPLE CELLAR.

I notice that C. L., Ringtown, Pa., wishes to build an apple house. I have an apple cellar or storage with a packing house and storage room above for boxes which I built about 10 years ago; it has given good service so far. Size of cellar, width outside, 22 feet; length, 34 feet; depth in ground six feet, three feet above level of ground, which gives me nine feet in the clear as depth of cellar. It is built long way, north and south; walls are of cement, on top of the walls. I have a two-story building, side walls 14 feet, first story eight feet. I store boxes, barrels and baskets in the upper story when not in use. If water is not too near the surface to come into the cellar, go down in the ground deep; the cellar will not freeze as quickly as when shallow. I have four windows in my cellar walls, two on each side.

Olinda, Ontario. M. G. B.

A BOY'S FARM PROBLEM.

I am 15 years old and wish to be a farmer. We own 175 acres of land. There is one pasture that has not been used for years. It is sandy, parts are dry and others swampy or lumber; lot of spruce, pine, hemlock, etc., is to be removed soon. It is all run out and bushy. Here is where I am to get my education in farming. I have neither time nor money to go to an agricultural college. I wish to keep pigs, cows, sheep and animals of all kinds as well as poultry. I like nothing better than machinery and I can make myself happy any time studying engines or machines of some kind. I do not know where to begin in the pasture. I like to study plants too, and do not know but what I will raise oats and other grain that will grow in this country or hay and grain, and raise a calf, but I cannot have milk. Could you help me solve this problem? A. H. W.

Massachusetts.

I expect you are going up against a harder proposition than you realize. A poor or rundown farm is not the easiest thing to tackle. Just the same I would not discourage you from trying it. Since you have little or no money to invest, you will have to start in a very small way. Let us begin on that sandy pasture, and see what can be done. Unless it is really too poor, I would plow it under and grow it to corn this Summer. Corn always comes in handy as a stock feed as well as the fodder. I suspect this field has very little "life" or humus in it. You must find some way of getting humus into it. This you can do by either manuring it or turning a green crop under and liming it. In the South we would use something like cow peas or Crimson clover to turn under. Following the corn you would probably better seed the field to rye. This rye you can either plow under the Spring following or have your cows or a flock of sheep pasture on it. If you cannot afford to lime it, you would better pasture it. Again, if you decide the land to be too poor for corn this year, sow a mixture of Canada field peas and oats. This will make fine hay if cut early for either sheep or cows. Either turning crops under or manuring the field will get rid of the bare spots. The wet spots you may have to drain. You probably will have to dig a ditch to do this, and leave it open or build a stone drain.

You want to have all kinds of stock. On a place like yours I would not want more than one or two kinds. Better make one pay first. If you like them, you can make your best start with chickens. You must make them your main business, though, and not neglect them because some other farm work is pressing. Then maybe you can get a half dozen or a dozen sheep to start with. After you have learned how to care for them you can get more or save all your lambs. Remember that you can buy 10 sheep or 60 chickens when you can buy only one cow. If that cow should die, you have nothing left. If one or two sheep die you have eight or nine left. You would better have only 20 sheep and 200 hens that pay than twice that many on a poor farm with a good chance of not having enough to keep them.

I see you would like to raise a calf without giving it its mother's milk. It can be done, but you must remember that you have become that calf's mother and must take good care of it accordingly. I happen to know of a very thorough test that was carried on with various calf meals and can recommend their use where you must either use them or lose your calf. Using calf meals reduced the cost of feeding the calf one-half or more, according to the method followed. Of course, you could make up a homemade feed of oatmeal gruel, hay tea, and linseed or blood meal, but I think you had best at least start with something already prepared for the purpose. R. B.

SEEDING TO ALFALFA—CENTRAL N. Y.

I have a field I am planning to seed to Alfalfa, and intend to use lime on it, also have a quantity of wood ashes I would like to use. Would it be advisable to use with the lime or would phosphate be better? State proportions to use. It was plowed last Fall. I have a piece of Alfalfa that does not do as well as it ought; seeded it two years ago, and when it was in blossom cut the first year; cut twice last year, but it grows short and not as well as I would like. Manured part with cow manure and that was not any better than that I did not manure. Do you think cutting the first year is all right in as cold a climate as this State? E. D.

Oneida Co., N. Y.

As early in the Spring as the ground is dry enough to work perfectly, this field should be thoroughly worked and made fine and compact as deep as it was plowed. The cutaway harrow, spring-tooth, smoothing harrow and roller or plank drag, by repeated application, will accomplish this. Towards the last of this fitting apply the lime and 500 pounds per acre of acid phosphate. The wood ashes would be of no especial benefit. They contain about 1½% phosphoric acid, which is not available, and about 4% of potash which is of no benefit on soil in your locality. They contain about one-third as much calcium oxide as the land lime, and are worth about one-third as much per ton as the lime, in cases where the land needs liming. In ordinary years this field could be fitted about May 1 and should be left fine and smooth on the surface. Keep out of the field for 10 or 12 days, so that all the weed seeds that have been brought near enough the surface to germinate will do so. Then wait for a rain and after the rain, when the ground is dry enough to drag, sow the seed, 30 pounds per acre, one-half in each direction, and drag both ways with some tool that cannot go more than one inch deep, the object being to cover the seed to kill the weeds already started and to avoid bringing up any fresh weed seed from below to grow with the Alfalfa. That is, raise the weeds first and then raise the Alfalfa. Finish the field with a roller if dry enough, or with a plank drag if not perfectly dry. When the Alfalfa is two inches high, sow broadcast, on a dry day, 100 to 200 pounds per acre of finely pulverized nitrate of soda. If pure northwestern grown seed, from Idaho or Montana, is used, in 10 weeks after sowing it ought to cut 1¼ tons per acre, and seven weeks later another crop of about the same size, both of clean Alfalfa free from weeds, and it will stand 12 to 15 inches high when Winter sets in.

My experience has been that a top-dressing of stable manure, six or eight loads per acre, when the ground is frozen in the early Winter of any year, and especially the first, both decreases the danger of Winter-killing and greatly increases the growth of Alfalfa the following year. After a couple of years, when the Alfalfa is firmly rooted, it should be dragged occasionally to keep out grass and weeds and stimulate the Alfalfa. This may be done in the early Spring, when the ground is dry and before growth begins or after mowing. Almost any kind of a tool will do, but there is an Alfalfa cultivator made for this purpose, which is a spring-tooth drag with narrow diamond-shaped points.

I should advise the application of at least 500 pounds per acre of acid phosphate sown broadcast and dragging the ground with a spring-tooth or smoothing harrow (teeth set nearly straight) early in the Spring when the ground is dry and before growth starts very much. Then soon after the growth starts, sow on a dry day 200 pounds of finely pulverized nitrate of soda. I am surprised that the application of cow manure to a part of the field did not improve it, as I have always found a light top-dressing of manure in the Winter greatly beneficial. It should be cut once or twice the first year. I am located in New York State about 100 miles exactly west from the inquirer and I have frequently cut 2½ tons per acre in two cuttings the first year, and four to six tons each succeeding year. HARRY G. CHAPIN.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS **1914**

RAISE CORN AT 12c A BUSHEL

This is what Mr. L. S. White of Connecticut did in **The Coe-Mortimer $500.00 Corn Contest in 1911.**

You remember that the competition was for the **most profitable acre of corn** raised in New England.

You probably remember also that **The Coe-Mortimer Company** had nothing to do with the judging or with the awarding of the prize. This was all done by a disinterested committee from the Massachusetts Corn Show, and the records were approved by The Director of The Connecticut Agricultural Experiment Station.

E. FRANK COE FERTILIZERS will help you to equal this record. Perhaps you can beat it.

It **cost** Mr. White just **$42.-50 to raise his corn.** (Official figures.)

The committee valued the 7733.9 pounds of stover produced at $8.00 per ton, amounting to $30.93.

The difference between $42.-50 and $30.93 is $11.57; and this is what it cost Mr. White for the 97.9 bushels of shelled corn (12% moisture) raised on his acre. (Official figures.)

Figure it out for yourself: 97.9 bushels of shelled corn cost $11.57—one bushel cost $11\frac{8}{10}$ cents; or in round numbers **12 cents per bushel.**

If superior goods and superior service interest you, write to us promptly.

$1,000.00 Prize Cup for Best Corn Raised in the United States. Won at the New York Land Show, 1911, by Mr. Wm. H. Dorin of Virginia, a user of Coe-Mortimer Fertilizers.

Farm Engineering.

Questions About Radium.

Can you give me any information concerning radium, where it is found, how produced, and what are the characteristics by which one recognizes it? Could it be found here among our Connecticut rocks? We have a variety of stone, plenty of silica, also garnets, etc.

Bethel, Conn. F. H.

Your question was referred to an expert who is thoroughly acquainted with recent developments in Connecticut. His reply is that radium has been found in the State, and probably will be found in greater quantities. There are some peculiar rock formations there, as you say. Radium could not possibly be detected by any but the most expert chemist or geologist. It is usually found in pitchblende or in carnotite. The carnotite deposits of Colorado and Utah are among the most important in the world. Carnotite is either a yellow or brown ore found frequently in sandy shale or in the cracks in sandstone. Pitchblende, you probably know, is a jet black, shiny mineral. A ton of the pitchblende contains only a very small fraction of an ounce of pure radium. It would take about 300 tons to produce an ounce. Yet this mineral has a greater radium content than any other. The radium is separated by multitudinous chemical processes. Solutions are repeatedly formed and crystallized in order to separate the barium and radium. It requires extreme care, patience and skill, and the process is a very long one. At present there is only about oneninth of an ounce of radium in the United States. It will probably be a great many years before there is an ounce of pure radium in existence. R. P. C.

Pumping from Well.

I have a dug well at my home 34 feet deep about four feet in diameter; it is a very strong well, and always plenty of water, averaging from 10 to 15 feet; could not be pumped dry unless you would attach a fire engine and larger hose. I would like to work out a plan to have running water without using an engine or motor. L. A. H.

Harrisburg, Pa.

Get a branch pipe force pump. It will have to be set over the well in order to get the cylinder down within 15 or 20 feet of the water surface. The best plan is to put it right in the water. The branch pipe opening is connected to a supply pipe which leads up by the kitchen sink to a storage reservoir of any kind in the attic, or even in the pantry or kitchen, so long as it is above the sink level so that a faucet may be placed in the pipe at the sink. Below the faucet place a check valve so that no water can run back from the storage, but the pipe below can empty out. Then, each morning, or as frequently as need be, you can pump the tank full and it will run out at the sink faucet as you need it. The pump may also be used to deliver water at the well, if wished, by turning the three-way cock to close the branch pipe and connect with the spout. If you desire a hot-water front in your stove, you can supply hot water tank from the storage reservoir, tapping on to the pipe anywhere above the sink faucet. R. P. C.

Freezing Water Supply.

During the cold snap around the first of the year our water pipe on the farm froze, and we had to disconnect the entire system from the spring so as to save as much of the pipe as possible. The water main has a length of about 1,600 feet, the first 200 feet being ¾-inch, then about 1,000 feet of one-inch and then about 400 feet of ¾-inch; have one branch of ¾-inch to feed home, one ¾-inch to milk-house, one ¾-inch to horse barn, and the main (¾-inch) home. We kept the four faucets open about their full capacity, and at 10 p. m. everything was all right, but at seven a. m., frozen up tight, as the water from some unknown cause must have either stopped or slackened. My farm is situated in Ulster Co., N. Y., and often the temperature is as low as 28 to 30 deg. below zero. I would like to have an expression of your views as to the cause of freezing. I think that perhaps there were too many outlets, thereby drawing off the water faster than the ¾-inch main at head of spring could supply it, thereby probably creating a vacuum somewhere in the one-inch pipe, and the frost then had a chance to freeze some part where exposed. The main is not buried the entire length. As we shall have to put in a new main, would you advise a small or large one, provided there is sufficient water to fill the main at all times. W. C. H.

New York.

It is pretty hard to guess what happened without having seen conditions. The water probably flowed pretty slowly in some of the branches. Probably the faucets froze first, if they were exposed. If not, there may have been a gradual freezing through the half full pipe on the house end. Running water will freeze, you know, if exposed long enough to a low temperature, unless it runs very swiftly. I would bury the whole pipe, and where it is exposed elsewhere, encase it in a box of sawdust or wrap it with wool, etc. Don't trust just to the fact that it is running. If you have shut-offs in the ground near the outlets, you can shut the water off nights, drain out the pipe between the shut-off and faucets, and sleep sound. You can also, if you wish, shut off the whole thing at the spring and drain the pipe every night. You will need an air inlet at the spring in this case. If you don't like the walk up to the spring each night and morning, arrange two alarm clocks, one to release a drop weight automatically which closes the valve, at night and then in the morning the other releases a larger weight which opens the valve. If none of these remedies is to your liking, the one-inch pipe all the way would be preferable to the ¾-inch. R. P. C.

Construction of Wet Battery.

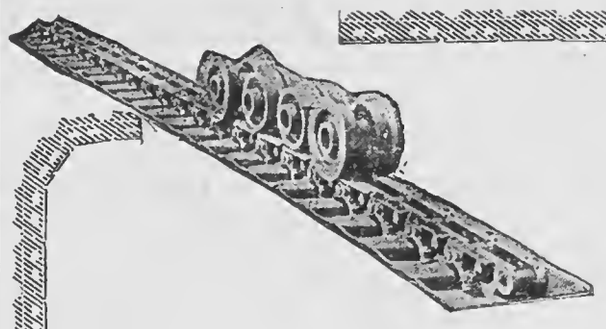
I understand that there is an open circuit wet battery made with the use of sal-ammoniac. Can you tell me how they are made and how they compare in strength with a dry battery? L. H.

Illinois.

The liquid in a dry battery is sal-ammoniac, but it is soaked up in sawdust or blotting paper so that it will not spill. A wet battery of the same kind can be made by immersing a strip of zinc and a piece of carbon in a solution of sal-ammoniac. Usually the zinc is rubbed with mercury until coated with a mercury surface. This is called amalgamation, and it prevents rapid local deterioration of the zinc. The top of the carbon (where the binding post is) and the top of the glass jar in which the liquid is, should be dipped in paraffin, or be greased so that the sal-ammoniac will not creep up and form a coating. The strength, that is, the voltage of the dry and of the wet cell is about the same. When the dry cell has run out it must be thrown away. The wet cell can always be renewed by a new zinc or by fresh sal-ammoniac. The carbon from an old dry battery makes a good carbon for a wet cell. It needs cleaning, but does not need waxing usually. A new zinc battery pencil, as they are called, all amalgamated and ready for use, costs only about seven cents, while a package of sal-ammoniac sufficient for one battery costs only five cents. R. P. C.

WATERPROOFING A CELLAR.—Can any of your readers tell how to prevent water from coming up through a six-inch concrete cellar bottom, or how to make a cellar water-proof? I am troubled with water coming in my cellar up from the bottom. How do they keep water out in the Subway? There must be some way to make a cellar water-proof. A. S.

LEAKY TANK.—I wish some of the readers would tell me what to do with my water tank to make it hold water. It is made of 2x4 pine planks, 10 feet diameter, four feet deep. The staves not matched. Could it be lined with cement, say one inch thick? Perhaps some of your readers have had experience with leaky tanks and can give some practical information. The water is pumped by windmill to tank and supplies barn and house, also henhouse. The tank is located over the barn floor and keeps the floor wet. W. H. M.



Lays its own track and rolls over it.

Can't slip can't pack the soil

Place a board over a mudhole. It will hold you up—if it's long enough and wide enough. The Caterpillar tracks hold the Caterpillar up—on any soil, wet or loose or sandy. It is all a question of area, or—to put it another way—traction surface.

Greater traction surface means better distribution of weight. Result--no miring and *no soil packing* on any soil. A round wheel tractor's weight is all carried on a very small area. The Caterpillar's weight is carried on a very large area. It can never slip--pack--stall—when it is needed most.

Notice the track spread out in the picture above. See the solid steel rails--a smooth, firm support. Eight truck wheels, four on each side, carry the tractor's weight. They roll along like the wheels of a freight car--and are as strong.

The 1914 60-h. p. Caterpillar is *guaranteed* to do the work of 32 good-sized horses. Every part is carefully inspected. From foundry to paint shop, nothing is overlooked that will prevent delays in the field. Forty-three years of manufacturing experience have taught us to be thorough.

CATERPILLAR

Reg. U S. Pat Off.

The Caterpillar is a utility tractor. It does all things well--rather than a few poorly. You get more days work a year--you don't have to wait for dry ground. You can rush your work when it means better crops. You can plow deep on any ground--hard or soft. Deep plowing and better tillage mean good farming.

The Caterpillar is built in several sizes. Send for Catalog AI 19. It describes 1914 construction. Get it now.

Planet Jr.

No. 25 Planet Jr Combined Hill and Drill Seeder and Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be easily worked with this tool.

You need these scientific soil-tillers to save time, lighten labor and get bigger crops from your farm and garden. Planet Jr tools are backed by more than 40 years' experience. They range from $2 to $100, and are fully guaranteed.

FREE Our new 72-page illustrated catalogue of 60 of the latest tools, for *all* cultivation. Write postal *today*.

S L ALLEN & CO

Box 1107V Philadelphia

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

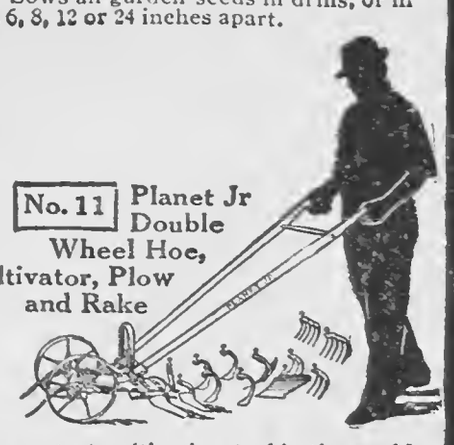
This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Sows all garden seeds in drills, or in hills 4, 6, 8, 12 or 24 inches apart.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to use by man, woman, or child. Has leaf guard for close work, and a durable *steel* frame. A most useful tool in the family garden that makes the work really a spare-moment pastime.

No. 8 Planet Jr Horse Hoe and Cultivator

The best-known cultivating implement made. It is so strongly built that it withstands incredible strain, yet it is light and easy to handle. Has new steel wheel—will not clog with stones or trash. Cultivates to any depth and adjusts to any width. Opens and closes furrow, and hoes right up to plants without danger of injuring them.



No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc. and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

The Home Acre.

Cucumbers on New Land.

Can I grow cucumbers profitably, other conditions being favorable, on ground just cleared of oaks, chestnuts, locusts and wild cherries, after giving a heavy coat of lime and fertilizing liberally?
New Monmouth, N. J. S. E. G.

I have seen good crops of cucumbers grown on new land, and have also seen some complete failures. The proposition is a game of chance, and whatever success is attained will depend upon how well the land is prepared for the crop, and the rainfall during the growing season. New land (unless naturally moist) never retains the moisture as well as it will after it has been farmed a couple of years. I would not advise you to put too much dependence on this land as a cucumber producer. I believe you will be better off financially if you crop it to corn this year. It will then be in a fair condition for cucumbers the following year. If you decide to risk cropping this land to cucumbers this year, you should break it up as deeply as possible, after which apply one-half ton of air-slaked lime and harrow in, and if available, use two shovelfuls of well-rotted stable manure to each hill, incorporating it well with this soil, which may be supplemented with benefit, by a small handful of pure bone meal to each hill, giving good clean cultivation. If the season should prove favorable it is possible the undertaking may return you a profit. K.

Keeping Accounts.

How many of us are making the same mistakes year after year, putting the corn in too early, doing something too late, just because we forgot when that same thing was done last year with the same poor results. Every farmer, gardener, florist or grower of plants for house and yard should keep a more or less detailed account of work done. Each row of plants, box of seeds, flower pot, etc., should bear a label. On the label should be, first, the name of plant. It is educational if both the common and botanical name are put down, thus, "Castor bean, Ricinus." Also put on the label the date of seed planting, and in case of transplanted things, the date of putting in permanent quarters. Later, the date of first fruit, harvesting, etc., can be added. These labels at the close of the season should be gathered and packed away, or the records thereon copied into a book. The coming Spring these records should be all read over when the planting is to be again taken up and the lessons shown should be heeded.

The labels will show some interesting facts. They will set the times for planting such vegetables as are to be used in succession, or if you planted at the wrong times will indicate that fact and enable you to make due correction of planting time. They will show how long it took the seedling tomatoes to grow from seed to setting, and thereby indicate when to get cold frames and hot beds ready. Many other valuable conclusions will suggest themselves from these records.

The above is about the simplest means of keeping track of things, but if you want to go into details, keeping account of soil, weather conditions, cultivation, insect pests, as well as the facts noted in the first method, a card index or book record can be kept. Use the labels as before, but all that need be put on them is the name and a number. Carry the same number in your book or on the cards and you can make as many entries as you desire. A fact not found in seed catalogues is the length of the germination periods of various seeds. These periods for a given kind of seed will vary from four to 28 days according to moisture and temperature conditions, but you can determine these periods for yourself. For instance, when planting indoors a seed you know will come up in four days, you do not need to worry about watering until growth commences, but if you happen to be planting parsley it is well to know that the seed should be soaked some hours before sowing, and that it takes about two weeks to come up. These facts can all be ascertained by dating the labels with time of sowing and time of coming up. Then the following year this information will result in more intelligent preparation of the seed bed and care of it till plants appear.

The information of years of record-keeping is what will reduce your work to a system, make far better farming, better gardens, more beautiful home, save days and weeks of lost motion. Every business is now being or has been reduced to system and haphazard methods have had to go. The written record of acts done is the key to system, and the arranging of these facts and records is the perfecting of the system. Just a word about labels. In the first method use a six-inch label, in the second a four. For indoor and cold frame work the labels may be used alone, but where used in the garden or field tie the label to a stout stick, driving the stick into the ground at the marking point, at an angle of 40 degrees, with the label on the under side. In this way storms will not affect the writing. P. L. W.

Watering Fine Seeds.

In starting early seeds, especially seeds that are very small, great care must be exercised in watering. There are several methods of keeping the earth in proper condition of moisture for good germination. For seeds of quick germination, such as cabbage, cauliflower and Aster, a thorough watering of the seed box before planting will generally be sufficient. The seed should be planted across the box in rows about an inch apart so that after the plants appear watering can be done without knocking over or washing out the tiny plants. Do this watering between the rows with a can having a nail hole at one side of the bottom; fill it with water and carry it back and forth between the rows across the box giving splendid results.

For seeds requiring a longer period of time to germinate such as peppers, tomatoes, parsley, pansies, and nearly all perennial seeds, a different method must be used. Water thoroughly as in the first method, and plant in rows also, but the seed box should then be covered with a glass and placed in good heat and strong light, but during the brightest part of the day a single thickness of paper should be placed over the glass. When watering finally becomes necessary (as the soil must never be allowed to become thoroughly dry) a whisk broom dipped in lukewarm water and shaken over the surface will provide moisture without washing out the seed. In case of very fine seed, such as primrose, Lobelia, Begonia, etc., the water should nearly all be shaken off the broom before using it on the box, which is done by drawing the hand across the bristles, causing a very fine spray to be thrown on the dirt.

Still another method is to so construct the seed box that the bottom is quite full of holes, then by setting it in a larger vessel containing water, moisture can be applied from below. Care should be taken, however, that the holes in the bottom of the seed box are not large or the dirt will wash through, dropping the surface of the seed bed. This is probably the best method of all, when rightly used. I do not allow the water to come to the surface of the seed bed before taking out of the water in which it is standing. A plant label stuck in the side of the box is used as a gauge to show how high the water is in the box and when it is within a half inch of the surface of the seed box, take it out of the water as plenty of moisture will later come to the top. Permitting the water to come to the top before removing from the vessel of water, is apt to make the soil soggy and cause seed to rot, or green mold to form on the surface. Still another method is the use of a good atomizer, which throws a fine, concentrated spray and will never wash out any seeds. P. L. W.
Michigan.

HARRY: "I understand Gertrude Gadalotte married a man who made a big fortune by a lucky speculation in soap. Grace: "Yes; and he disgraced her while they were on their honeymoon." Harry: "How did he do it?" Grace: "Gertrude wanted the other passengers to think an ocean voyage was an old story to them, when her husband, the first crack out of the box, pointed to a row of life preservers and asked the captain what was the idea of all the extra tires."—Life.

Are you the Best Farmer in your Community?

Alfalfa Plant on left Inoculated with Ferguson's Bacteria, on the right not Inoculated. From Government Bulletin No. 159.

Are you in touch with modern methods of crop growing and ways and means of increasing the productive power of your soil?

FERGUSON'S
NITROGEN
BACTERIA

will work for you! These bacteria collect nitrogen from the air and by converting it into plant food, supply the plant with nutriment for a successful growth. Adapted for use on all legumes (Alfalfa, clover, peas, beans, cowpeas, vetch, etc.

Ferguson's Bacteria is a composite liquid culture—easiest to apply. Made from the formula of Dr. Meade Ferguson, State Bacteriologist of Virginia—an assurance of its value.

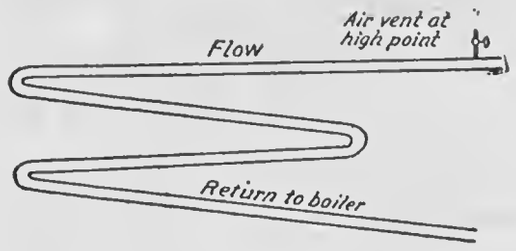
Greenhouse Construction for Small Place.

PART II.

Seven flow and seven return pipes would give ample heat for latitude of New York City, except for plants requiring high temperature. If the house is quite short, say 20 feet, two-inch pipe could be used, and each pipe could have a return bend on end and be carried back and forth several times through house, provided the fall was graduated at all points to return into boiler, as shown below. This method could be adopted in house 30 to 40 feet long also, as using return bends is much less work and expense than connecting three or four lines of pipe in a short house to headers, at flow and return end.

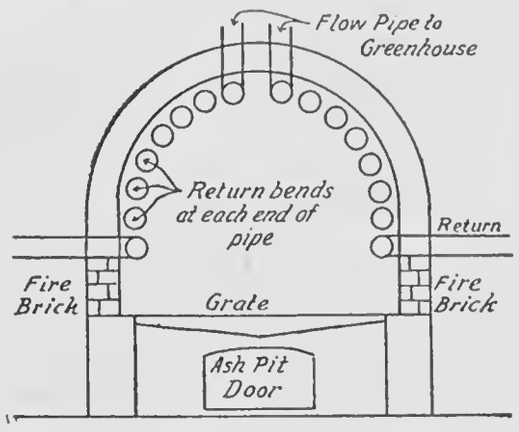
A number of different methods may be adapted for heating the water, depending on taste and desire of person building house. There are many different makes



FLOW AND RETURN PIPES.

of cast-iron heaters on the market that have unduly advertised virtues. We have had considerable direct experience with cast-iron boiler and have been observing performance of same for others for some years. The makers all claim many advantages, among which may be mentioned cost of handling in installing and making repairs; also economy is claimed. Regarding the latter the less said the better, as one of the best makes in the market recently heated a brick chimney so hot that the boiler shed of one of my neighbors burned down. In our own case the smoke pipe would get red hot. Others have told me of similar experiences. This, however, is under hard firing and if a cast-iron heater is much larger than actually required a fair degree of satisfaction may be attained. Another serious objection is the liability of sections to crack and put the heater out of business.

We heated two houses 24 feet wide by 256 feet long for several years by using a heater made of pipe coiled back and forth over a grate walled in with brick. This makes possibly the cheapest heater that it is possible to install, and if care is used in construction it will last a number of years and give satisfactory service. No particular method need be employed in installing the pipe, as I have known them to be used in many different ways. If it is possible to get a coil of 1¼ or 1½-inch pipe, 18 inches in diameter or larger, and of good length,

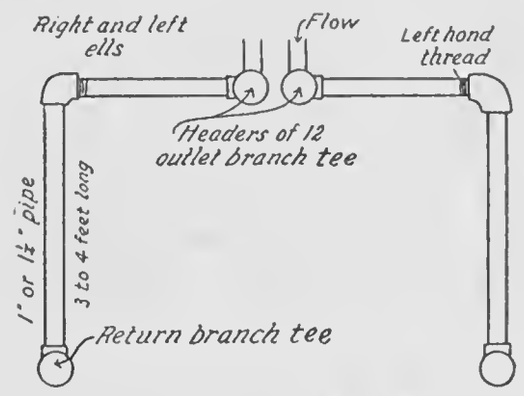


FURNACE ARRANGEMENTS.

that will be found as effective as any method. We have cut 1½-inch pipe 24 inches long and built up a square box coil, using malleable ells on same. We have also used pipe (two inches) eight feet long running back and forth over the fire (see above) on the inside of a brick arch having the lower pipe about 12 inches from grate, and top of arch 30 or more inches from grate, using 20 pieces of two-inch pipe in heater in four separate coils of five pipes each. A heater of this size would heat a house 30 x125 to 150 feet long.

Another method in use here, and possibly the most durable of this type heater is to use a long branch tee at bottom and top, each having 12 or more outlets from one-inch or 1¼-inch pipe, as shown at right. The center space of this heater contains a square box coil made up of short pieces of pipe and ells. In constructing these heaters care must be exercised to have only *guaranteed wrought iron pipe. Do not accept merchant or steel pipe under any circumstances.* Use only malleable fittings, and after you enter brick work at bottom *be sure the pipes are constantly ascending, as any pocket to retain air will prove fatal to success.*

A safe guide to go by is to use one foot of pipe in heater to about 15 in the greenhouse, using same size pipe in each place. Do not think that the closer you get the pipe to the fire the better, as by this method no combustion space is allowed, and this is a very important



ANOTHER PIPE ARRANGEMENT.

item in economical fuel consumption, as the gases of combustion give off nearly as much heat as the radiant heat of the fire, provided they are ignited. A temperature of practically 1700 deg. is necessary to accomplish this ignition, and where the cold water surfaces are too close to the fire, the gases are chilled and pass out of chimney in this manner, causing the loss of nearly one-half the heat value of the coal. The most economical boiler tested to this date has a distance of 35 feet from grate to top of fireplace, so don't be afraid to make an arch three or four feet high. These suggestions are merely for the person who does not care to spend much money on a heater. The man who can afford it would best buy a small tubular boiler or a special greenhouse boiler of wrought iron construction, of which there are several in the market.

If a pipe-constructed heater is used additional economy could be obtained by running the chimney a short distance through the house in the form of an iron or terra cotta pipe, as it will throw out nearly as much heat as the cast-iron boiler. Small second-hand tubular boilers can be quite often obtained at low prices, that will give excellent service as greenhouse heaters, and wherever such boilers can be had better try to get one rather than use a cast-iron boiler or a pipe heater. ELMER J. WEAVER.

Intensive Hayfield.

I am anxious to make a good crop of some good hay suitable for Winter feeding of our Jersey cow, and would prefer it to be clover hay with possibly a little Timothy if necessary, so we can also feed our horse the same. Would you advise me the best course to pursue as to preparation, fertilizing and variety and amount of seed to use in an acre to get the best result? Our land is light and sandy, leachy and feels a drought very severely, so much so that Timothy is very hard to raise. E. J. W.
Barrington, R. I.

We should start with the clover this Spring. Fit the land as early as possible, and sow either one bushel of beardless barley per acre, or about half the usual seeding of Canada peas and oats. In either event seed on each acre six quarts of Red and Alsike clover. Cut the barley or the oats and peas when they are fit for hay, and let the clover seed come on. A thick seeding of oats and peas will not be likely to give you a good clover stand. The thin seeding of oats and peas will give you more forage, but the beardless barley will make a better nurse crop for the clover.

"CONDUCTOR, can you tell me how that brakeman lost his finger?" asked the inquisitive woman. "He seems to be a very nice fellow. It is a pity he should be crippled." "That's just it, mum. He is a good fellow. He is so obliging that he wore his finger off pointing out the scenery along the line."—Chicago News.

"DEATH, TAXES AND The Mapes Manures

Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

Hope Farm Notes

HOPE FARM SCRUBS.—Our scrub hens are still in the ring at the Storrs laying contest. I cannot say that they are laying any rings around the world's record, but they are not tail-enders yet. Here we have a word from a chicken man:

"I hope the Hope Farm man will not let them bluff him out of that egg contest." L. F. G.
Ohio.

Well, gentlemen, I know what is promised to the boaster and the haughty spirit, yet I feel disposed to say that when they bluff the Hope Farm man out of a contest there will not be any contest left. For some reason my scrubs have aroused the ire of many otherwise good-natured hen men. As one good friend puts it:

"The entire country is laughing at you."

Well, sir, I never did expect to become a national character, as this statement would indicate. These 66-cent scrubs seem to be putting me up into the hall of fame. I do not deserve the honor. For it is an honor to provide amusement for the nation. This has been a hard and tedious Winter—full of trouble and gloom to many. If we could only gather the statistics of "grouches" we should find that there is a larger crop this Winter than ever before. Good, honest laughter kills off a "grouch" faster than lime-sulphur destroys the scale. If the entire nation is laughing at my scrubs they have done far more for the world than Tom Barron's Wyandottes. True, those Wyandottes have laid more eggs, but my scrubs have laid out more "grouches" by making more people laugh—while eggs would only increase the "grouch." Oh, no; if you want to laugh some man out of a contest you would better try it on some other character. The Hope Farm man has been laughed at for 40 years or more. He has become immune, and the scrubs will not mind so long as they have plenty of food and a nest. These early laughs are something like a tomato plant which has been fed on too much nitrogen. It makes a fine growth but it has a hard time when drought comes. The time to laugh in this laying contest will be on the second day of next November when the contest ends. That will be the time to let out a fine, long ha, ha, ha!

In this contest there are 82 pens, or 820 birds in all. I understand that 790 of these birds are purebred specimens, probably averaging at least $5 each in value. My scrubs cost 66 cents each. If any of these happy gentlemen who are laughing so merrily at my scrubs feel that my pen will end No. 82 in the final count, or that my 10 birds will be last of all in individual records, they can have a chance to make some charitable organization richer for their laughter. I have a lot of men tell me their hens are doing far better than the birds in this contest. My own hens at home are outlaying the scrubs at Storrs. But why do not these gentlemen with such wonderful hens get out into the limelight and show Tom Barron how to do it? When a man goes to buy a superior cow he wants to know what that cow's mother has done—not what the owner says she has done, but a certified, cold-blooded trial by some official who knows his business. In much the same way a record at one of the laying contests is worth far more than any private record, no matter how carefully made. Some of these gentlemen who are growing fat and good-natured laughing at my scrubs could not be driven at the mouth of a cannon to put 10 of their birds right up against the real thing at a poultry contest. Their wives and children might well contribute a purse to erect a monument to the Hope Farm scrubs, for father's laughter at this scrub performance has probably made him too good-natured to scold and find fault.

Then comes another man, a first-class breeder, who tells me my birds are not scrubs at all. He says most of them look like culls—the poorest specimens of purebred stock rejected for their evident defects. He cannot see what good can ever come from entering such poor culls. "Good" is only a result—often not to be observed until years have passed. There would be mighty little "good" in the world if it did not mean something which must be worked out through struggle and opposition and ridicule. Only those with clear, long-sighted vision can see the good which may follow humble things. If these birds of mine are not "scrubs" I do not know where to get true specimens. The dictionary tells us that a scrub is "a small, mean, inferior or worthless thing. * * * an inferior, worthless or worn-out animal * * * a runt," etc. If these birds are culls so much the better, for they are then purebred "scrubs," and their records will show that something besides "pure blood" is needed in a hen. I am ready to pay some good judge to "score" these birds, both for the show ring and for the "utility" standard. In fact, I will do anything to show that the Hope Farm scrubs represent a serious effort to learn something about poultry which the experts have not yet told us.

You will see by this time that the Hope Farm man will stand by his friends. The Lord loveth a cheerful loser. I consider that the "bulldog" element is one of the most important factors in human life. The dog haters may curse all dogs as useless pests and worthless nuisances, and I would walk a long distance with them, yet I think one great moral lesson of human life was framed in the ugly jaw and teeth of a bulldog. The unrelenting, unreasoning, undaunted ability of the bulldog to hang on with his fearful grip is the one thing which has made most of the human success that I know of. The yellow quality which takes the starch or spring out of those jaws under pain or pressure is the thing which spells failure. Perhaps not all the Hope Farm defenders are bulldogs. The four little boys built a big snow fort on the lawn near the road. Then they played that the "enemy" was coming, and that they must defend the home. The "enemy" turned out to be the nearest neighbor, and as he passed on the road he received a volley from the fort. Then the enemy charged. There was no bulldog behind the breastworks, but one redhead and three towheads ran in four different directions, while the neighbor very properly kicked the fort over and trampled on the ruins. These boys will pick up the bulldog later on. In the meantime, if anyone expects to kick those scrubs or "culls" out of the ring he must prepare for some sore feet.

Just what have my scrubs done to be laughed at? At the end of the eighteenth week there were four pens of pure bloods below them. During that week the scrubs laid 26 eggs, with 16 pens of pure bloods trailing behind. Why not laugh at these pure bloods? During the month of February they beat out eight pens of pure bloods. My Red scrub laid 14 eggs in February. There are 820 hens in the contest. Of these 576 birds laid fewer eggs than my Red scrub, and 32 tied her score. She beat four and tied one of Tom Barron's Wyandottes, and beat seven and tied one of his Leghorns for the month. During that month 125 birds never laid a single egg. There are 150 purebred Reds in this contest, and 98 of them failed to beat my Red scrub for February. Let's have a good laugh while we can. H. W. C.

Second-Crop Turnips.

Corn is not the only crop that we can grow, and I was a bit amused at your comment some months ago in regard to the growing of turnips as a second crop, being a new thing in Kansas. It is in truth a very old practice here in the Kaw Valley. I remember well having hauled many a 40 or 50-bushel load to the Kansas City market when I was but a boy and in the Fall and Winter of 1889 another young man and I, sold on the same market 13 carloads, about 450 bushels to the car. These turnips were grown by Edwin Taylor, and were all second crop, being grown after the early potatoes had been dug. W. E. K.
Lawrence, Kans.

Value of Ashes.

How valuable are ashes from beech and maple on land? I expect to seed to grass in the Spring. A. J. J.

A ton of such ashes should contain 100 pounds of potash, 35 of phosphoric acid and 600 of lime. There is no nitrogen. Three parts of ashes to one part fine bone should give a fair fertilizer.

OLD FRIEND: "What! Another marriage? I thought you told me the light of your life had gone out." Widower: "Yes; but I'm going to strike another match."—Melbourne Australasian.

SAFETY FIRST

Quality, Service and Lower Cost Mileage for Goodrich Tire Users

Goodrich Unit Molding is really the original "Safety First" idea in tire construction. Safety *must* go deeper than the tread.

❖ ❖

It *must* be made into the tire. Goodrich Tires are built on a foundation of Safety.

❖ ❖

The quality of Goodrich Tires today is the standard by which all high grade tires are judged. This is because they represent the perfection of tire-making and tire-knowledge.

❖ ❖

The user of Goodrich Tires gets the utmost in service and mileage, because each tire wears as a unit—every part of the tire helping every other part to perform the service demanded of it.

❖ ❖

And now the Goodrich Safety Tread solves the skidding and sliding problem for the motorist and gives him "Safety First" in actual operation as well as in construction.

❖ ❖

No odd projections to knock out the underlying tire structure or to make your car ride roughly.

Goodrich Safety Tread Tires
Best in the Long Run

The Goodrich Safety Tread

Five Bars and a Crosstie
The "Safety First" Symbol

The strong rubber fingers of the Safety Tread stop the skid before it starts. They make the brake effective and make your steering sure.

Just the unit-group of bars and crosstie which brace and balance strain on the tire so that the Safety Tread runs as a smooth tread—gives more actual service and mileage.

Here are the prices to pay for the best tires ever produced in the Goodrich factory:

Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices	Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices
30x3	$11.70	$12.65	$2.80	34x4½	$33.00	$35.00	$6.15
30x3½	15.75	17.00	3.50	35x4½	34.00	36.05	6.30
32x3½	16.75	18.10	3.70	36x4½	35.00	37.10	6.45

Emerson Grain Drills Always Cover

Deposit of Seed at Axle Center Does the Work

All Emerson Grain Drills deposit seed at axle center. An exclusive patented Emerson feature. Seed comes down concave side of disc, passes through center of hub, and goes into ground before soil rolls in. Seed always planted at bottom of furrow. Insures even germination. Unnecessary to run Emerson discs as deep as others. Light Draft. Drills deposit evenly regardless of ground conditions. All machines equipped with independent spring lift. 10 or 12 discs or hoes raised with least effort. Emerson Feed combines best features of both fluted and double run.

Ruralisms

Transplanting Holly.

Will you advise me as to the best method to pursue in transplanting the holly? Which is the better time to move the small wild trees, Spring or Fall?
Nokesville, Va. J. M.

Holly may be transplanted either in the early Fall, when the young wood has almost ripened, or in Spring, just before the plant starts into new growth. Small shrubs always stand a better chance than large ones, especially in the hands of inexperienced planters, but hollies of the larger size mentioned are moved satisfactorily if carefully done. When transplanted the leaves should be stripped off; this is imperative if there is any exposure, and the plant should be well cut back. Keep the roots well covered by a ball of earth so that they do not dry out.

Hardy Phlox; Japanese Iris; Shrub Propagation.

1. Will you give me a list of 20 of the very best varieties of hardy Phlox and 20 best varieties Japanese Iris? I want in each case very largest, finest flowers in greatest possible range of colors. 2. Can the hardy shrubs such as Philadelphus, Hydrangea, Diervilla, Spiræ, Viburnum and lilac be propagated by hardwood cuttings similar to the currant? If not, how best and easiest? M. S. P.
Massachusetts.

The following are all fine varieties of Phlox, standard sorts. Of course the list could be greatly amplified: Caran d' Ache, bright rosy carmine; Coquelicot, flaming red; Henri Murger, pure white, carmine eye; Jeanne d' Arc, pure white, dwarf; Albion, pure white, red eye; Le Vengeur, bright carmine; Mrs. Jenkins, pure white, early; Belvidere, salmon pink; Richard Wallace, white with violet eye; Pacha, vivid pink, dwarf; Siebold, vermilion with crimson eye; Vesuvius, red with purplish eye; Asia, mauve with carmine eye; Europa, white, carmine eye; Frau Anton Buchner, white, very fine, dwarf; Gefion, pale pink, carmine eye; Rheinlander, salmon pink, claret eye; W. C. Egan, lilac, red eye, very fine; Wanadis, white mottled violet, purple eye; Widar, reddish violet, white center. All these are good, but there are many more equally desirable.

It is not easy to give an accurate list of Japanese Iris under name. Many have been imported under Japanese names and renamed here; others have appeared under more than one Japanese name in the original importations. All the dealers who handle them carry worthy sorts. The list is given under Japanese names, we believe, of original importation: Six-petalled or double sorts, Yosimo, white veined with violet; Samidare, white veined with deep blue; Tokyo, pure white; Koki-no-iro, deep purple veined with white; Renjo-no-toma, light violet veined white; Uchiu, vivid reddish purple; Kagaribi, white, marbled with vivid blue; Rish-no-tomi, white veined with violet; Hosokawa, purple veined white; Sano-watashi, white with yellow center. Single three-petalled sorts—Shippo, lilac with purple veins; Ariake, violet marbled with white; Sakata, lavender and blue, with deeper veins; Kigan-no-misao, pure white, late; Yedo-Kagami, mauve veined with white; Shino-maki, deep royal purple; Sherataki, silvery white edged pale violet; See-o-bo, white, slightly marked with purple; Meiran, white, densely margined purple; Shuchinkwa, reddish purple, veined white.

2. Diervilla, Philadelphus and Spiræa may be grown from cuttings of mature wood, also lilac. The Diervilla is quite easily grown from these cuttings, made in Winter, and planted in Spring. Layers are often used for Philadelphus. It is generally considered that green cuttings of Spiræa give better plants, taken in Summer and started in a frame, but hard wood or layers may be used. Hydrangea paniculata grandiflora is usually propagated by green cuttings taken in June and started under glass; layers are also employed. Layers give best results with Viburnums, or green cuttings taken in Summer and handled under glass. Layers, suckers and root-cuttings of lilac are employed, as well as hard wood, and green cuttings in Summer, set in frames. Layers are very satisfactory and manageable where indicated in cases where glass is not at hand.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

IF you live in New York State take your pen in hand this minute and write a note to your member of the Assembly and to Hon. Thaddeus C. Sweet, Speaker of the Assembly, Albany, N. Y., and tell them you are in favor of the Food and Market bill introduced by Hon. A. E. Smith. Tell them you regard it the most important piece of legislation proposed in your lifetime, and request them to help secure its passage at this session of the Legislature. You have not a minute to spare. The Legislature adjourns March 27. Write these notes or telegraph at once.

*

SOME of the worst hold-ups in the fertilizer trade seem to be started by the dealers in "patent" limes. Farmers are told all sorts of stories about the potash and phosphoric acid which such lime contains—the object being to make them think a tremendous bargain is offered. In one case $9 per ton was charged for a "phosphate lime." A farmer who received this "literature" found that he could obtain good limestone of high quality close at home for about $2.50 per ton, and could buy for one dollar more all the phosphoric acid found in a ton of the remarkable stuff which the dealers wanted to sell him.

*

HERE is the latest news from our old friend Luther Burbank:

Perhaps the most remarkable cradle ever provided for a new plant species is the armored bank vault in which the latest creation of Luther Burbank, the plant wizard, are being guarded against loss or theft until Spring planting time. Accounted more precious than diamonds, these seeds—less than a peck—are watched with all the care of priceless gems. They represent the scientific investigation and experimenting of a quarter of a century by Burbank, holding out promise of great commercial value.

We doubt if Mr. Burbank will take honest or well-meant advice from us—but here it is. Take that group of hot-air producers who made the atmosphere tremble over the Wonderberry and lock them in with those "priceless seeds." Shut off the air and fumigate with bisulphide of carbon. This will destroy any bugs on the seeds.

*

IN the February 14th issue reference was made to the employers' liability law in Connecticut and New York. I would like to know about the Massachusetts law in regard to farm labor. I have been informed farmers were liable employing five or more laborers, and others have told me farmers were exempt. R. B. H.
Massachusetts.

In Masachusetts this law exempts farm help and domestic servants from its provisions. This is specifically done as follows:

"The provisions of the eight preceding sections shall not apply to injuries caused to domestic servants or farm laborers by fellow employees."

We can find nothing in the law that would indicate the number of laborers employed by a farmer would have anything to do with the degree of his liability.

*

FARM MANAGEMENT.—It is said that during the past few years there has been developed a science of managing the farm on true business principles. Let this not be confined to outdoor farm operations, but let it take in the household work. In the next magazine number of Woman and Home we shall begin the publication of the best study of a farmhouse interior—arranged for the business of housekeeping—that has ever been printed. We say this advisedly, and all know how careful we are to refrain from making rash promises. The article is not by any sanitary expert or theorist, but by a farmer's wife, who took a poorly arranged and rather rambling farmhouse and slowly made it over, so that a day's inside work is a pleasant task rather than a long, hard journey.

THE New York State Agricultural Department is trying to find places on farms for worthy men now out of work in town and city. The Department is going at this work in a sensible way. Only a part of these city men could ever give satisfaction as farm hands. They are the ones who at some time of their lives have done farm work, but who do not fit into city conditions. They would not prove expert farm helpers at once, but if the farmer who hires them will be patient and fair some of these men will make good. The genuine tramp or "bum" should not be sent to the farm at all. He will prove a menace and a disappointment, and the city man who knows nothing of farming would be of no particular value until he learned how to work. The department is coöperating with priests, ministers and church organizations seeking to find useful and honest men for this farm work. It is a good movement, but a farmer should not expect too much from these helpers. Give them a fair chance. While they cannot expect large wages to begin with, they are entitled to good treatment and patient training. It will be better for the Department to send out a few good helpers rather than a crowd of worthless fellows, who would only drift back to the city.

*

IF you have ever tried to transfer a piece of real estate you will appreciate the article by Dr. Price on the first page. Of all the various forms of legal graft none is more galling or unnecessary than the fees for "searching" the ownership records of real estate. We have paid $25 for such a "search" of a small property when all the lawyers had to do was to go to their safe and look at a paper which they drew up two years before. In some States the "title guarantee" companies have made life a nightmare to the ordinary owner of real estate. These companies pick flaws in titles on the merest technicalities, and frighten the buyer into holding up the sale until the owner "satisfies" the company—which means paying a legal bonus to the lawyers. We know of cases where these companies have interfered with a sale on childish reasons, and caused trouble and loss to people not accustomed to doing business. The Ohio law will enable the real estate owner to obtain a certificate from the State which will go with the title upon a transfer of the property. When such a title is once registered the so-called "search" will be unnecessary. Thus the law cuts out a useless and expensive legal process which modern society has long outgrown and which should have been given up long ago.

*

ON the next page will be found a statement of the bill to create a Food and Market Commission for New York State. Of all the suggestions for helpful agricultural legislation thus far advanced none has been so vital and far-sighted as this. The suggestion gets down to the heart of the trouble which our farmers have endured for years. The 35-cent dollar issue dwarfs all others in importance. This question of the division of the consumer's dollar into 65 cents for the handlers and 35 cents for the consumers is the greatest financial issue of the age. It is also the great moral issue of American agriculture, for the present system of division is unjust and wicked. The longer it goes on the worse it becomes, for the 65 cents which represent the handler's share rarely if ever come back to the farm. This unjust share accumulates in the towns and cities, leaving the nation in the condition of a man constantly threatened with heart trouble. The greatest need of our national life to-day is some fair and honest system which will bring about a fairer distribution of the consumer's dollar. Give the producer a fairer share (for example, 50 cents instead of 35), and the extra money flows back to the country. There it will be spent to satisfy legitimate demands or to purchase necessities, giving the most wonderful impetus to trade that America has ever known. The country will take on new industrial life. Men and women, feeling that they receive a fairer recompense for their toil, will take new interest and independence and view life with broader and happier eyes. If you need confirmation of this statement go into the sections here and there where farmers have been able to standardize their products, and thus grow and sell them to the best advantage. For example, the fruit-growing districts in Western New York. These growers obtain their 50-cent dollar and more largely because they have taken advantage of natural conditions, but partly because their increase of prosperity has enabled them to combine and standardize their products. The result is that in these sections we find a class of free, intelligent, thinking, prosperous farmers, who are changing the history of their sections in the most hopeful way. Let any man think what would follow if farmers in all sections of the State could feel this same hopeful spirit. There is just one thing that will give it—the feeling that they receive a fairer share of the final price of their products. Thus this 35-cent dollar issue lies at the root of the matter. We may talk "two blades of grass" until we are green in the face, but one strong man in the market place showing how to get a fair price for one blade of hay will do us more good than 1,000 men teaching the "two blades of grass" theory. As this question directly and indirectly affects every person in the State it is a matter for the State to take up. It will require the brains and the energy of a great business man—as large a man in his way as any who ever governed the State. The principle of the proposed law is sound and the time is ripe to put it into practice. The time is short, for the Legislature will adjourn soon; therefore we must act at once. THE R. N.-Y. never asks its friends to get busy with the Legislature unless there is some supreme need for it. *That need has now come. Write your Senator and Assemblyman at once and urge them to push this Market Commission bill through!*

*

ALL this talk about lime means largely that farmers are trying to fit their land for crops not naturally suited to them. It is now well known that Alfalfa, Red clover, Timothy and similar crops demand a "sweet" or alkaline soil in order to grow properly. On many of our Eastern soils the lime supply has been greatly reduced. Such soils were not limestone to begin with, and many years of cultivation have removed much of the original lime. Thus only poor crops of clover or Alfalfa can be obtained from these acid soils without heavy applications of lime. The great advertisement which Alfalfa has received in late years is greatly responsible for the lime craze. We call it a "craze" because that is the proper name for a practice or a theory, useful within reasonable limits, when it is carried to unreasonable extremes. Attempting to grow clover or Alfalfa on very acid soils is an unnatural process at best. We may easily come to a point where the large amount of lime required to sweeten and maintain these lime-loving plants may cost more than it brings in. We know of cases where in their efforts to grow wheat, Alfalfa and Red clover farmers have used so much lime that these crops cost too much. These are cases where there is a long haul by railroad from the limekiln, and which makes the lime cost too much for practical purposes. In such cases reason would show us that it is not good policy to try to naturalize these crops on an acid soil. It is far better business to grow those crops which do not need so much lime, but which will grow and give a good yield where the ground is sour. Rye, buckwheat and corn grains will thrive on sour soils. Soy beans, cow peas and Alsike clover are legumes which gain nitrogen from the air, yet make a fair crop under acid soil conditions. Red-top will make a good growth where Timothy fails. There are thousands of localities in the East where these acid-enduring plants are far better adapted to our soils than the lime-loving wheat, Alfalfa or clover. We believe in lime, and use it on our farm yearly, but it should be bought and used with judgment, and in many cases the acid-soil plants will pay best.

BREVITIES.

RAISE the weeds first, and then raze them with a fine-toothed or dragging tool—while the weeds are small.

IT is claimed that English sparrows are good to eat—they make a good "pie." No, thank you; others may have o r share.

NEW YORK'S big snowstorm, February 14, cost the city $480,000 for snow removal, employing 16,000 men and 5,000 horses.

THE best late Summer garden peas we have had are the dwarf varieties. Let the early crop ripen and use this ripened seed for August planting.

THERE seems to be great interest in the sunflower crop. Without question there is a demand for the dry seed. We have had several good articles about it.

IN these days of autos and rapid travel there is no better advertisement for the farm than a good lawn and well-kept flower garden. This pays now that direct dealing with consumers is on.

MANY people write about seeding pasture crops in old orchards for hogs or sheep. Among other things they should plant several good fences. By dividing such orchards, they may have one crop growing while the stock eat up another.

SOME of our readers say that the eggs come out of the water-glass solution in bad condition—stale or even rotten! Before you blame the water-glass be sure the eggs were clean and fresh when they went in. The "glass" cannot cure a bad egg. It can only hold a perfectly fresh egg in fair condition.

PACKING 100 PER CENT. APPLES.

"FACING" THE BARRELS.—The article by Harry G. Chapin on page 251 should be read carefully by every fruit grower, especially those who are now trying to put up a first-class pack in a commercial way. It is evident that Mr. Chapin has never packed apples, if he really means what he says. The resolution passed by the Western New York Horticultural Society was bad enough, and the apple men who voted for it surely could not have stopped to consider what effect it would have on their business. If the law proposed by Mr. Chapin were to go into effect the only way we could comply with it would be to face every barrel with the poorest and smallest apples in that grade. If we wanted to keep in the apple business we should have to pack all our fancy apples in boxes, and sell the rest in bulk to the canneries and evaporators. There would be thousands of bushels of perfect apples which were of poor color which could not be sold to the people who want to buy them, because it would be too much trouble to pack them in so many grades. In our own case it would be necessary to put up at least six grades of perfect apples instead of the three we pack at present. Professor Wilson made similar suggestions at the meeting of the New York State Fruit Growers' Association, but it seems to me that both he and Mr. Chapin are laboring under a misapprehension. Prof. Wilson made the point that it is dishonest to face a barrel with apples better in any way than the average of those in the rest of the barrel. There are in the world varying opinions in regard to honesty and dishonesty, and each one thinks he is right, but it seems to me, as a fruit grower, that it is no more dishonest to face a barrel of apples with a single layer of well-colored apples not larger than some others in the barrel, if the size variation in the grade is not too great, than to face a box of dried peaches with a single layer of perfect pieces. Personally I should buy the well-faced barrel in preference to the unfaced one or the poorly faced one, and pay a premium for the facing even if I knew that the other barrels contained just as many perfect apples. I think most persons would do the same, just as one would buy the most attractive package of any other food material.

UNIFORM SIZING.—In our packing house we are trying to make as nearly perfect a pack of apples as possible, *but we are not packing 100 per cent apples*, and I do not believe there is a grower in New York State who is. Our apples are graded to size by the best machine we could get, and under such conditions that practically all the imperfect fruit is removed and sold as culls, and there is practically no variation in average size and quality from end to end of the barrel. The smallest apples are as likely to be directly under the face as anywhere in the barrel, but we face with well-colored fruit picked out as the apples are being run. We sort into three size grades, 2¼-2½ inches, 2½-3 inches, and over three inches in diameter. In 1912 we faced the small apples with a single layer of 2½-inch apples. That is, we made three rings around the face and put one apple in the center. The next size we faced with two rings around and four in the center, or apples just under three inches. The largest grade was faced with the largest apples we could get, provided they were not too large to make two rings around and one apple in the center. In some cases we had to put two or three apples in the center of the face of this grade. Theoretically, this the best way to face, but in 1913, at the earnest solicitation of the men to whom we sell our crop, we increased the size of the apples in the face, putting two rings and four on the smallest, and two rings and three on the intermediate grade. This pleases the buyers better, although we feel that there is too much discrepancy between barrel and face in the smallest grade. If the law proposed by the resolution adopted at Rochester should be put in force it would be necessary to face our smallest apples with 2¼ inch, our main crop with 2½ inch, and the largest with three-inch apples. If, in addition, Mr. Chapin's suggestion were followed it would be necessary to use also the poorest colored apples we could get. In other words, Mr. Chapin's idea is to make our package as unattractive as possible. This would be to the advantage of the city man for a short time, for the price of apples would go down to such an extent that many growers would become discouraged, but when the acreage had become sufficiently reduced the price would soar. In the long run, it will benefit no one to prevent apple packers from putting on their barrels a face of attractive apples not larger than the largest in the rest of the barrel. There should not be more than a single layer of this face, and the apples immediately behind it or those at the tail of the barrel should be a fair sample of all the package contains.

PACKING FROM SORTER.—In our packing house, the apples as they come from the grader spouts are run directly into the faced barrels with no further sorting except that the barrelers are required to watch for imperfect apples that have escaped the sorters. The man who is putting the apples into the machine is required to mix up crates of large and small, green and bright apples as much as possible, and the machine mixes them up still more, so that the grades run very uniformly through the barrels and from barrel to barrel. Of course, occasions will arise where a group of trees will be loaded with small apples. If such a run is followed by the picking of some trees which have very few small fruits there will be some variation in the average size of the apples in different barrels of the same grade, but the variation will be less than might be expected, and would be very much less than would be the case if the grading were done by hand over an ordinary table, even by the most experienced men. This is the great value of a grading machine. A good man can grade apples as exactly or more exactly than the best machine, but he cannot do it as rapidly, and his No. 2 grade in large apples is very likely to be about as large as his No. 1 in small apples of the same variety. Moreover, a man who must bend all his energies to the task of sizing his apples cannot do so well at picking out imperfect ones.

We are trying to put up such a pack as we should like to buy, and for the good of the business we wish all our neighbors (that is, every apple grower in Western New York) were compelled to do the same, but we feel that such a law as is proposed by Mr. Chapin would be very unjust, and would be an especial burden on those of us who are trying to raise the quality of the Western New York pack.

ALFRED C. WEED.

Wayne County, N. Y.

A FOOD AND MARKET COMMISSION.

Far-sighted Legislation for New York.

OUTLINE OF THE PLAN.—The most comprehensive, and to our mind the most beneficial piece of farm legislation ever proposed in this State is embraced in a bill introduced in the Legislature last week for the creation of a Food and Market Commission for the State. The benefits of this measure are comprehensive because the work must help every person who consumes farm food products, as well as every person engaged in the production of them. The bill proposes to create a single-headed commission. The Commission is charged with the duty of helping to organize cooperative societies of producers and consumers, and to help establish and supervise local coöperative warehouses and markets for the assembling and grading of farm products, the supply of local trade and the shipping of the surplus to general markets. In addition the Commissioner is required to establish an auction market at points in the State deemed advisable and for this purpose he may acquire premises by lease, purchase or condemnation as required. When the market is so established he will publish a notice for the benefit of shippers and producers of farm food products. The products shipped to these auction markets will be sold by licensed auctioneers, bonded and licensed by the Commissioner. There is a provision that none but responsible and high-class men would be selected for this service. The auctioneers will be entitled to charge a small commission for the sale of the produce, and this commission will be regulated by the Commissioner on schedules previously published by the Commissioner. It is expected that ultimately the markets will be self-sustaining, but the bill carries an appropriation for initial expenses of the proposed department.

GRADING AND SELLING.—The Commissioner will also provide trained experts to inspect and determine the grade and condition of the produce as it is received. The commissioner is charged with the duty of providing a proper place and proper safeguards for the care and distribution of goods consigned to these auction markets, and if for any reason the auctioneer is unable to sell any portion of the product at public auction, or if he is unable to sell it at auction at satisfactory prices, he is authorized to so sell and distribute the unsold portion at private sale at the best prices obtainable, and in all cases a prompt return must be made to the shipper after deducting the auctioneer's commission and transportation charges. The Commissioner is also required to publish a daily bulletin giving the price of the preceding day's sales in all the Department markets of the State, and also giving advice as to the available supply for the farm products, and the demand for same in local as well as in foreign markets. The Department is also required to prepare bulletins from time to time on the best methods of sanitization, packing and transportation of farm products, and distribute such bulletins to consumers.

TRANSPORTATION.—The Department is also charged with the duty of investigating delays in transportation and to negotiate proceedings to prevent restraint of trade or unlawful combinations to fix prices. It shall, when notified by producers that food products produced within the State seem likely to spoil for a ready market, make such suggestions to such producers, and take such steps as may seem advisable to facilitate the distribution and sale of such products. There are penalties provided for violation of the law or for neglect of duty on the part of auctioneers, inspectors, or other employees of the department.

THE GOVERNOR'S MESSAGE.—Governor Glynn called the attention of the Legislature to this bill in a strong and vigorous special message, from which we quote the following extracts:

"Complaints have reached me from time to time that under present conditions consignees of farm goods frequently speculate in such goods to the disadvantage of both producer and consumer. That they misstate the condition of the goods when received, and that they return inadequate prices for the quality and grade of goods consigned to them. At present the farmer has no adequate means for redress.

"No honest consignee of farm produce has anything to fear from the measure I propose. Twenty years ago France established auction markets and provided for publicly licensed auctioneers. Although only a comparatively small percentage of produce sold by farmers throughout France now passes through the hands of these auctioneers, the fact that this method of selling is open to all producers and is comparatively free from all abuses and establishes prices in definite grades and measures, compels all produce dealers to treat their shippers with fairness. The system also eliminates the abuses of the present system where dishonest and unscrupulous dealers practice methods detrimental to the honest dealer. It avoids the temptation of an honest dealer to meet competition by following the questionable methods of an unscrupulous competitor as a means of self defense. Under the auction system if the commission man or dealer treats a shipper unfairly their business automatically passes into the hands of the licensed auctioneer.

A constant complaint from both producer and consumer is that dealers and many handlers of farm food products, prevent the regulation of price through the natural channel of supply and demand. A shortage of supply is invariably followed by an advance of prices to the consumer, but an increased supply does not result in so prompt a reduction of the price established in the time of scarcity, and frequently no reduction whatever is made. As a result of this policy the finest of food products often rot on the farms because the producer is not able to obtain enough for it in the wholesale markets to pay the cost of transportation and marketing, to say nothing of the cost of production, while the city consumer is obliged to pay for this identical kind of produce the high price demanded in season of such productions. Both producer and consumer are denied the benefit of the bountiful crop. Under the French system of auction markets this condition cannot exist and does not exist because the low price of a flush market stimulates the demand and increases consumption of the production and automatically increases the price given as the surplus disappears.

"I propose to give the farmers of New York the same measure of protection which licensed auctioneers afford the French markets. After much consideration and consultation with farmers and consumers, I have reached the conclusion that this can be best effected through a single-headed Food and Market Commission.

"What New York needs is a reliable meeting ground for the man who has produce to sell and the one who wants to buy; a place where they can make their exchanges through a reliable intermediary with a fair charge for the service, and a place where prices must follow the natural law of supply and demand. Such a market system can be provided by the measure I suggest, and I urge it upon the earnest consideration of the Legislature."

New York State News.

AYRSHIRE BREEDERS ORGANIZE.—The Northern New York Federation of Ayrshire Breeders is the name of a new organization of stockmen, formed at Camden, N. Y., on March 6. About 50 breeders were present from the four counties of Northern New York and an enthusiastic interest was manifested. The officers of the Federation are Geo. H. Converse of Woodville, president; A. F. Spooner of Richville, secretary-treasurer and a vice-president from each county. A representative breeder from about a dozen localities was appointed to look after the work of organization of local clubs. The Federation will meet annually in connection with the farmers' week, at Canton. A field meeting will be held some time in June.

BOOMING THE HOG.—And now the hog is to receive his due. Or to put it differently, an interest is to be stimulated in pork growing by the operation of a hog demonstration train on the New York Central which will run through some of the counties of the western part of the State beginning at Buffalo on March 16. H. P. Harpending of Dundee, will accompany the train and give talks and demonstrations on breeds, feeding, housing, etc. He will have assistants from the agricultural department. The train will consist of two coaches which will be fitted up for the purpose, one to be arranged for lantern slide talks and the other will carry the hogs used in the demonstrations. Two hour stops will be made at each point on the schedule.

WILL IT WORK?—Something decidedly new in the line of help for the farmer is proposed by Gov. Glynn and Commissioner Huson. They propose to help him to secure help. And in this way: A large number of the unemployed men and their families will be transported from New York City to points in the Mohawk Valley where the farmers of that section will have opportunity to hire them to work on their farms. The labor bureau of the Department of Agriculture is to bear the expenses of the transportation, as this expense has always been a deterring factor in inducing the farmer to secure his help through the bureau. If the plan works out as anticipated it is expected that at least two cars of laborers will be taken into the country every week during the Spring and as soon as the cars arrive at their destination farmers will be advised and can come and make their own arrangements with the men. The first carload will leave New York this week.

GOV. GLYNN AND THE COAL BILLS.—We think the Governor is on the right track in trying to get the coal supply of the various State institutions at a lower price. Up to this time each institution under control of the State has bought its own coal and at such prices as it could obtain, with the probability that no very close attention was paid to the said prices. It appears that the coal bill for the State institutions amounts to somewhere about $1,000,000 a year. The Governor is informed by an engineer who has had much experience in the purchase of coal in large quantities, that the State can save $200,000 a year on its coal bill. It is proposed to purchase the entire supply of one company and so eliminate all dealers' commissions and get the benefit of wholesale rates, which the Governor claims the State is not getting under the present methods. It is proposed to buy the coal at so much per heat unit, or on the British thermal heat unit basis. If a standard ton of coal contains or develops 14,000 heat units and the price per standard ton is $4, then whatever the coal develops, under sample test, will be paid for on the basis above named. If less than 14,000 units then the purchaser can claim an indemnity from the coal company for each thousand units less than the standard, and if it develops more than the 14,000 then the State shall pay for the extra thousands of heat units.

Woman and the Home

From Day to Day

THE PROMISE OF BREAD.

Out on the frozen uplands, underneath the snow and sleet,
In the bosom of the plowland sleeps the Promise of the Wheat;
With the ice for head and footstone, and a snowy shroud outspread
In the frost-locked tomb of Winter sleeps the Miracle of Bread!
With its hundred thousand reapers and its hundred thousand men,
And the click of guard and sickle and the flails that turn again,
And drover's shout, and snap of whips and creak of horses' tugs.
And a thin red line o' gingham girls that carry water jugs;
And yellow stalks and dagger beards that stab thro' cotton clothes,
And farmer boys a-shocking wheat in long and crooked rows,
And dust-veiled men on mountain stacks, whose pitchforks flash and gleam;
And thrashing engines shricking songs in syllables of steam,
And elevators painted red that lift their giant arms
And beckon to the Harvest God above the brooding farms.
And loaded trains that hasten forth, a hungry world to fill—
All sleeping just beneath the snow, out yonder on the hill!

—C. L. Edson in American Magazine.

*

A SIMPLE but very nourishing dish to take the place of meat is macaroni alla Campagnola. Partly cook in boiling salted water six ounces of macaroni; partly drain, and replace in the pan with four ounces of melted butter, four ounces of grated cheese, and four well-beaten eggs. Mix well, and stir over a slow fire for 15 minutes. Serve with grated cheese.

*

ONE of our readers recently asked for recipes for cooking Swiss chard, a useful vegetable which always finds a place in our own garden. We were somewhat surprised, on examining four standard cook books, and a fifth devoted entirely to vegetables, to find no mention of chard in any one of the five; so we gave the inquirer our own methods of using it, without any added wisdom from others. Chard is so easily grown and productive, that it ought always to find a place in the home garden. If any of our readers have further recipes for preparing it, we should like to hear of them. Indeed, we should like any new or little-known recipes for cooking vegetables. Such recipes are always useful to rural housekeepers, and anything that aids the consumption of garden products must result in ultimate benefit to the farm.

*

THE Youth's Companion tells how a young girl in Mississippi asked her brother for money to go to college. He said he could not afford it, and tossing her a nickel, added, "Unless you can go on that!"

The plucky little girl took the five-cent piece and bought some calico from which she made a bonnet that she sold for 25 cents. With this money she bought more calico and made more bonnets. After she had made several dollars in this way she determined to raise potatoes. She did all the work in the field except the plowing. The venture was a success and she had enough money to start to school. She did not stop work, however, and it is not surprising that a girl of so much determination was able to borrow enough money to supplement what she made. She was graduated with honor from the State College for Women, attended a medical school, still earning all her expenses, got her degree and is now a successful practicing physician in a large town in the South, and it all began with a nickel.

*

THE cable despatches reported a desperate fight between a cormorant and a lobster was watched by a crowd at Dollymount, near Dublin, Ireland, March 3. The cormorant dived into the water and rose with the lobster in its beak. The bird then descended rapidly and vigorously battered the lobster against a rock. The cormorant rose again and shook the lobster as a dog does a rat. Suddenly the cormorant began flapping its wings violently and struggled with the lobster until it became exhausted and fell dead on the beach. It was found that the lobster had gripped the cormorant's tongue and the bird died of suffocation. This recalls a similar battle which we witnessed, some years ago, between a fish-hawk or osprey and a large fish, the scene being a large tidal river near the New Jersey coast. The osprey, after its natural habit, made a sudden descent to strike a fish, but instead of rising at once with its prey, was seen to struggle violently at the surface of the water. There was a brief but terrific battle, amid clouds of spray and a boiling mass of foam, as the great wings of the osprey lashed the water. Viewed through a telescope, it could be seen that the bird had struck a fish too large for it to master, yet so securely that it could not release its talons. After a time the unlucky bird was seen floating with outstretched wings, evidently drowned by the struggles of its anticipated victim, which had apparently escaped, though it must have been severely lacerated by the osprey.

An Easter Dinner Party.

Soft greens and yellows are suggestive of Spring, and they make a charming color scheme for an Easter dinner table. One simple arrangement, in which these colors prevail, is gained in this way: Make a simple basket of white birch bark, and fill it with ferns, and as many blown egg-shells, tinted a pretty yellow, as there are to be members of the party. Fill each shell with small bonbons, and use them as favors at the close of the meal. In the middle of the table arrange a mat of the ferns, and place the basket in the centre. The ferns one finds in the woods in Winter are still fresh and green in April, and will do very nicely for this decoration.

If the dinner is to be at night, have the candle or lampshades of yellow and green crepe paper, and one long-stemmed yellow flower (jonquils are very appropriate) placed across each plate will make a very effective finish to the scheme. The flowers can be either of paper or the real blossoms, as the case may be, and, if one likes, they might take the place of the tinted egg-shells, especially if they can be the real jonquils. The lovely shades of these flowers would harmonize beautifully with the green of the ferns.

A menu for a dinner in Spring should be, like the decorations simple and dainty:

Cream of Corn Soup, Crackers
Olives, Pickles
Roast Loin of Lamb, Mint Jelly
Mashed Potatoes, Peas, Rolls
Easter Salad
Easter Custard, Maple Syrup Cake
Coffee

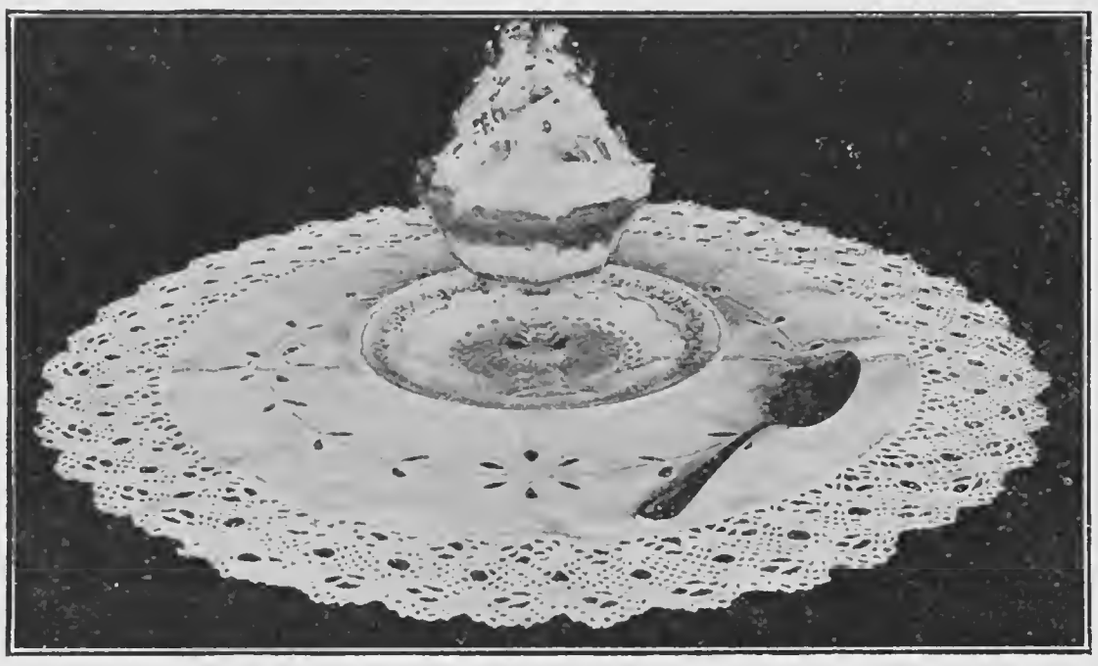
Make the soup in the usual way, using one quart of milk to one can of corn, then just before sending it to the table add a sprinkle of the yolk of a hard boiled egg, pressed through a potato ricer, and have the crackers toasted a delicate brown.

For the meat course select parts from two loins, scrape the bones between the ribs, as far as the lean meat, and trim off the backbone. Shape each piece in a semi-circle, having the ribs outside, and fasten the pieces together to form a crown. Trim the ends of bones uniformly, but do not leave them too long, then wrap a thin slice of salt pork around each, to prevent burning. Sprinkle the meat with salt and pepper, cover with buttered paper, and roast one and one-half hours. Before serving remove the pork from the bones, and fill the centre of the crown with hot, well seasoned peas, drained dry. For the mint jelly, make a plain unsweetened lemon jelly, and add enough mint infusion to flavor, and tint it.

By many an Easter meal is not considered complete without eggs in some form, so we will have ours served in a salad. Separate yolks and whites of six hard-boiled eggs. Chop the whites very fine, and mix with French salad dressing, then arrange on lettuce leaves; if lettuce is not easy to get, as is often the case in the country at this time of the year, the inner leaves of a crisp head of cabbage will answer the purpose very well. Force the yolks of eggs through the ricer, or a sieve, and pile on the centre of the whites, and moisten with the dressing. If you can get a green pepper, cut it in narrow strips, round and round, and garnish the top of the salad with it, this will carry out the color scheme used in the decorations admirably.

To make the maple syrup cake, beat two-thirds of a cup of butter to a cream, then add one cup of granulated sugar, and gradually four tablespoonfuls of maple syrup, and the beaten yolks of three eggs. Sift three cups of flour with four teaspoonfuls of baking powder and a little salt, and add to the first mixture, alternately, with two-thirds of a cup of water, then fold in the beaten whites of the eggs. Bake in two layers.

For the frosting and filling boil two cups of maple syrup until it spins a thread, then pour in a fine stream over the beaten whites of two eggs, beating constantly meanwhile. Return to the fire over hot water, and beat until the egg stiffens, then add one cup of finely chopped walnut meats.



EASTER CUSTARD WITH WHIPPED CREAM.

The dessert is simply an ordinary custard, flavored with almond extract, and baked in individual molds, chilled, and turned out in glass serving dishes, then piled high with sweetened whipped cream, and sprinkled with powdered macaroons. If the cream could be tinted a delicate green with vegetable coloring, which is quite harmless, it would give this simple dessert a still more festive appearance. ROSAMOND LAMPMAN.

Swiss Chard.

Will you give some recipes for cooking Swiss chard? MRS. S. P.

The first tender young leaves are boiled, drained dry and chopped, then served like spinach, seasoned with pepper, salt and butter. As the chard grows larger, the leaf is stripped from the stout mid-rib, and this only is cooked. It may be treated like asparagus, boiled in salted water and then dressed with cream sauce, or melted butter, pepper and salt. We prefer to cut it into inch lengths for boiling. The stalks may also be boiled and dressed with plain French salad dressing. Chard is very desirable in the home garden, as it is very productive, and any excess is greedily devoured by the hens.

PREVENTING BUTTER STICKING.—Pour boiling water over prints and then drop them into fresh buttermilk and let stand until butter has been washed. Then put prints into good clean cold water to wash off buttermilk then put into cold water and they are ready for use, and you will have no trouble from butter sticking to prints. A. C.

Mrs. Grumble—"I see by this paper that most of the States are passing laws to prevent women from working over eight hours a day. That applies to everybody except us, I guess. We country women can work all day and half the night and nobody cares."

Anty Drudge—"The way *you* work is enough to make anybody gloomy. But you can make your own eight-hour law if you want to. Just use Fels-Naptha Soap. It will get your work done for you in even less than eight hours every day, *even washday*."

Fels-Naptha Soap stops overwork and overtime. It's better than any laws, *because it gets the work done*, instead of just preventing you from working.

On wash day, soap your clothes with Fels-Naptha and put them to soak for 30 minutes in cool or lukewarm water, then rub them a bit with your hands or on the washboard, rinse and hang out. Fels-Naptha does everything as quickly and easily.

Better buy it by the box or carton and use it every day. Follow the directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

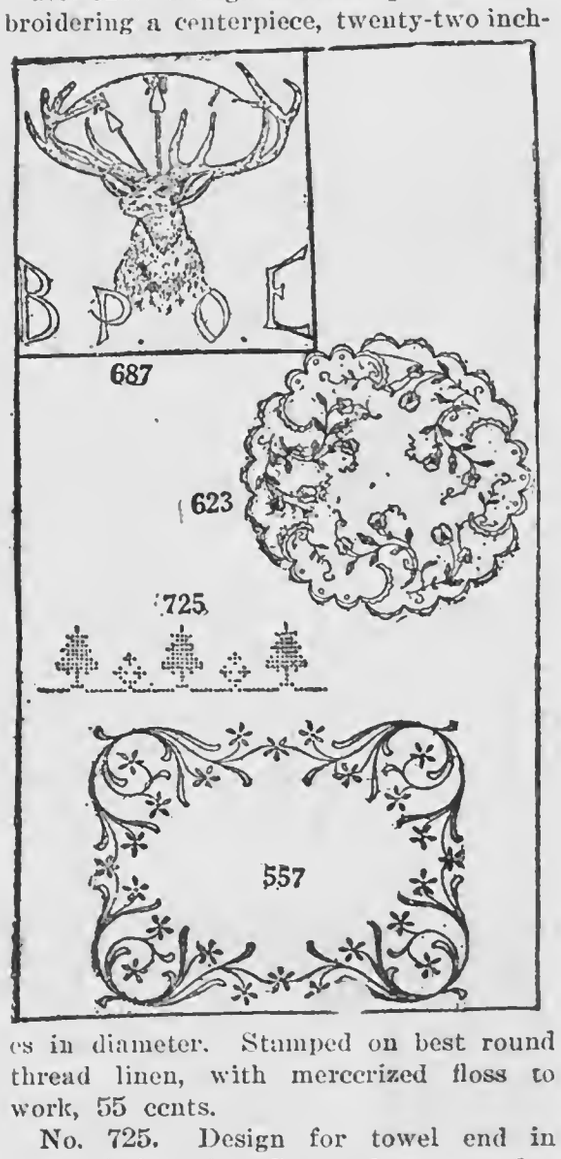
8184 Fancy blouse, 34 to 42 bust. 8192 Fancy blouse, 34 to 40 bust. 8176 Semi-princesse dress, 34 to 40 bust. 8183 One-piece peg top skirt, 22 to 32 waist.

8201 Two-piece skirt for misses and small women, 16 and 18 years. Price of each pattern 10 cents.

The embroidery designs include materials for working. Separate transfer patterns, without materials, may be obtained for 10 cents each.

No. 687. Design representing the emblems of the Order of Elks, suitable for embroidering a cushion or pillow cover. Tinted in fast colors on tan ticking, 22x22 inch. Duck back and mercerized floss to work, 40 cents.

No. 623. Design in sweet peas for embroidering a centerpiece, twenty-two inch-



es in diameter. Stamped on best round thread linen, with mercerized floss to work, 55 cents.

No. 725. Design for towel end in cross-stitch style. Stamped on superfine 24x15 inch pure linen, with mercerized floss to work, 55 cents.

No. 557. Design for embroidering a baby pillow, a sofa cushion or a centerpiece. Stamped on white pure Irish linen, with mercerized floss to work, 60 cents.

"Small Stuff."

"Small stuff" is the term used by night bakers to designate the small products made by them, and includes the various kinds of rolls, raised biscuits, and in fact anything in that line, smaller than a five-cent loaf of bread. My husband, who was a baker before becoming a back-to-the-lander, has given me much valuable information and instruction along this line, which I never was able to gain from the standard cook books. The recipes for making the various doughs are given quite understandingly, but when it comes to the manipulation of this dough, and shaping the rolls, buns or whatever it may be, the book gracefully subsides in a "of-course-you-know-how" manner, and you feel that the author has paid you a decided compliment in assuming that you do know how. Take for instance the ordinary breakfast roll, known by the bakers as the "turn-over" roll. The shaping of this roll in its perfection is in itself an art that requires months if not years of practice, and it must be remembered that this practice consists of making perhaps one hundred dozen or more each night.

If you should try to make a perfect turn-over roll, and fail, do not be discouraged, but remember that it is part of a trade, and cannot be learned by a correspondence course. One point to be remembered is that bread dough is the base of all raised stuff; rolls, buns, raised biscuit, doughnuts, etc. I have been making turn-over rolls for some time with the instruction and aid of my husband, and feel that I have become quite proficient. The method employed by me is the same as is employed in all bakeries where the work is done by hand. The dough is made just the same as an ordinary bread dough; it may be made richer by the use of more shortening. I usually take a part of my bread sponge to which I add milk instead of water as for bread, and rather more lard and sugar. When the dough has risen and has been kneaded (punched as my husband says) and becomes light the second time, I take it out of the pan and roll it out into a long roll about as thick as my wrist. This roll I cut into pieces of equal size about as long as a hen's egg, which I roll into balls. This rolling process requires considerable practice; it is done by placing the palm of the hand on the piece of dough with the fingers curved downward and slightly inward around the dough. With the nails of the fingers touching the board, the thumb, which is allowed to rest on the board is curved around the dough, forming a sort of inverted pocket. With the dough held in this position, the hand is given a few quick rotations allowing the dough to turn in the hand. Some flour must be used on the board to prevent the dough from sticking, but not too much, or the dough will slide and not turn in the hand as it should. These little balls of dough should be rolled until they are smooth on top and round. As they are rolled I lay them aside, smooth side upward until they become somewhat soft. Then taking a ball in each hand I roll them on the board until they are about four inches long.

I now take each piece and with a small rolling pin (about the size of a broom handle) roll from the center toward each end several times, stopping each time just before reaching the end, which leaves a little ball on each end of the strip. The middle should be rolled to about twice the thickness of pie-crust. I now grease each piece with melted butter or lard, using a small flat paint brush kept for the purpose, and fold over. At this point care should be taken that the large ends are perfectly even, otherwise they will upset while rising. Place on pans as fast as folded. In bakeries this is known as "pairing" and also requires some practice. They must be placed on the pans evenly and the proper distance apart; otherwise in raising they will touch on one side before they do on the other, which would draw them out of shape, or cause upsetting.

A roll dough should be made somewhat stiffer than a bread dough, for unless the flour is extra strong a thin dough will make flat rolls. "BAKER'S WIFE."

Protecting the Table.

Tables are often spoiled by water seeping through the earthenware pots which hold ferns or other plants. These earthenware plates which are unglazed, may be made waterproof by putting a piece of paraffin in the plate and setting in warm oven. Let the paraffin melt and sink into the pores of the earthenware; turn dish so that sides will be paraffined also. Let cool and you will have no more trouble.

I. M. B.

Paint Questions.

Some time ago I read that a fine paint for floors was old Dutch green paint. It said to use common crude "blind green" paint, mixing into it black paint and burnt sienna paint. So far I have failed to find anyone, painter of paint dealers, who know what "Dutch green" or "blind green" paint or "burnt sienna" are. Can you tell me?

I notice the directions for all glue paint use yellow ochre. Why is this? Will not other dry paints do as well? If so, what ones? I have tried all sorts of paints for my porch floors but as yet have found nothing that will not peel and wear off easily. Can some one give me a good one? E. M. S.

Cornmeal Boiled Pudding.

This is a dish our forefathers used to have for dessert when they had an old-fashioned boiled dinner. I never have made it myself, but am going to try it next Fall when the supply of home-grown corn comes from the mill, as they tell me the meal must be good in order to have a good pudding. My grandmother used to make it 70 years ago. She would sift some meal into a pan, make a hollow in the center and put in salt enough to season it, then poured on boiling water and stirred it (as you would a hoe cake). It should be thick like hasty pudding when put into the bag. Put into a cotton bag and tie up but leave room enough for it to swell, as it will swell a little (there could be a little saleratus put in, but she put in nothing but salt). Drop it in the kettle of boiled dinner or meat and boil two hours. The liquid must be boiling when the pudding is put in, and kept boiling all the time. The pudding has a flavor of the liquid it is cooked in. When turned out onto a plate it is a round yellow ball. Serve with molasses or sugar and cream.

I wonder how many of THE R. N.-Y. readers can apple. I know of no one who does it, but I do not think anyone who ever had some home-canned apple to use the latter part of Winter or early Spring would ever allow herself to be without it. We had a rather light yield of Winter apples last Fall, but lots of early Fall apples, so I canned Astrachan, Wealthy and Porter apples, have some two years old that are just as good as the day they were canned. A Winter like this when they are scarce and high-priced, they are coming in very handy, both to use and to sell.

Don't Buy Pumps Blindfolded!

There are over 300 types of pumps—each best for a certain purpose.

Can you pick out, unaided, the one that *will exactly suit* your needs?

Won't you be saving time and money by getting expert advice? Write our Mr. Gould, in care of our Consultation Department. He will advise you from his expert knowledge—help you choose the pump that will best serve you, and at the lowest cost. There is no charge for this service. You may as well have the benefit of it.

GOULDS RELIABLE PUMPS

Before you make up your mind on pumps, in justice to yourself, you ought to investigate Goulds Reliable Pumps.

For over two generations they have held top place. There are more Goulds in use than any other line of pumps made. That's pretty good evidence of their quality. And you'll find Goulds Pumps sold by the best dealers in your town. That's another proof.

We make hundreds of thousands of pumps yearly. This big output enables us to give maximum value at lowest cost. Be sure to look up the Goulds dealer, whether you need a small cistern suction pump or a large power pump.

This Book Free Tells how to have running water any place on the farm. Illustrated with pictures and diagrams. Twenty pages crammed full of pump information you ought to have. By filling out the blank in this book you will, without obligation, get facts and cost of the very pump outfit you require. Write at once.

THE GOULDS MFG. CO.
58 W. Fall Street
Seneca Falls, N. Y.
Largest Manufacturers of Pumps for Every Purpose
(31)

Spring begins, with sunburn and tan. Dr. Crane's Almond Cream mornings and Dermal Cream nights keep the skin smooth and well. Each, by mail, 25c. Dr. F. D. CRANE, Montclair, N. J.

Cut Down Grocery Bills!

This Daring Book Tells How

How would you like to buy many of your groceries for just HALF the usual price? How would you like to save 15 per cent. and more on staples like Flour, Sugar, Coffee, etc.? You can do it. You can make an average saving of 35 per cent. And to prove it, it is only necessary to send a postal for Larkin Co.'s latest free Grocery Book. It **pictures, prices** and **describes** some 200 choice Groceries, at prices that literally **astound** most people. No matter **what** grocery foods you want, you'll find them listed in this daring Book.

Where We Save You

We save you the retailer's profit and his cost of doing business. And in most cases we also save you the wholesaler's profit and operating costs. For we sell direct from factory to 2,000,000 families. Our plan is sound, sensible, safe and economical. Thirty-nine years' experience have proved this.

The Famous *Larkin* Guaranty

Larkin Groceries are so absolutely pure and high-grade that we permit any family to try them entirely at our risk. If, after trying them you are not satisfied, merely send back the remainder. All your money, including freight, will be returned—AT ONCE.

Postal Card Brings Book by Return Mail

The Larkin Grocery Book offers, in addition to 200 Grocery Products, some 700 general Household Supplies. The low prices are amazing. Just compare them with what you have been paying. Then you'll see why 2,000,000 families buy of Larkin Co.

No matter where you live, you can profit greatly dealing with us, for we have warehouses in different parts of the country. Just say on a postal, "Send me your Grocery Book No. 17," and this astounding Book will be sent by return mail, free and postpaid. Do it NOW

Larkin Co. Dept. 17, Buffalo, N. Y.

Heating Plans Free

Don't decide on your heating system for home, church, school or other buildings before getting free plans and factory prices from the Kalamazoo expert engineers. Real scientific service. Easily installed in old or new buildings. Plans furnished free also for future homes.

No Freight —No Delay "A Kalamazoo Direct to You" (Trade Mark Registered) And Gas Stoves Too **Satisfaction Guaranty—**

Cash or time payments. Satisfied customers everywhere. Ask for names near you.

Write for FREE BOOK Explains many advantages and big saving. **Ask for Catalog No. 910**

Kalamazoo Stove Company, Manufacturers, Kalamazoo, Mich.

We make full line of Ranges, Stoves, Furnaces, Metal Kitchen Cabinets and Gas Stoves. Mention catalog wanted.

Live Stock and Dairy

"Some Cow" in Black and White.

After having bred them for about 20 years, I decided last Spring to let the Jerseys go. I still firmly believe that they will produce more butter, and of a higher quality, than any other breed, in proportion to the value of food consumed. But this is a market-milk section, and the cow that produces the greatest amount of market milk at the least cost, is the popular animal, and the animal that the buyers come expecting to find. Of course this cow is the Holstein—the old-fashioned Holstein that gives an enormous flow of milk testing around three per cent butter fat. Why should she produce any richer milk? The legislature says that three per cent is rich enough, and three per cent is all that the dealer pays for. Then why should our good Dutch cow waste her time and her owner's high-priced grain in putting a lot of fat into milk for which he gets no pay?

After the Jerseys were gone, I stocked up the pasture with grade Holsteins; that is, the rough part of the pasture that could not be plowed. But I was not satisfied with just grades, so I began looking around for a registered Holstein cow for the foundation of a herd. A purebred cow is no better than any old cow unless she *is* better. I shall be glad when the time comes when purebred cows will be plenty enough so that all of them shall be stricken from the register books that cannot qualify for the "A. R. O." degree by the time they are five years old. I finally found a heifer that satisfied me pretty well at $250. She was thin in flesh, and she was largely black (I wonder why most of the good ones are black?). She had an official record of 449.1 pounds of milk and 14.66 of fat in seven days, made at two years and a month old. Sixty-five pounds of milk a day is pretty good for a two-year-old, especially when one considers that she kept up her flow to such an extent that she was not dried off at all, and was still milking when she dropped her second calf.

She had just been bred for her third calf when I bought her, and was milking 30 pounds a day when I forced her dry, and began to fit her for her next lactation period. She dropped a fine heifer calf on February 4, before she was four years old, and I loaded her on the sleigh and took her to a neighbor who was putting some through an official test. February 10 he started her on test, and in seven days she gave 515.8 pounds of milk, which tested 17.61 pounds of fat, or 3.414 per cent. She gave 77.5 pounds of milk the best day of the test, and 77 pounds the second day after I brought her home. She is registered as "Lady Nanuet Pietertje" No. 151855 and weighs 1090 pounds.

Madison Co., N. Y. J. GRANT MORSE.

Are Silos Going Out?

I am thinking of building a concrete silo, as I have a good bed of sand and gravel suitable for concrete work. One of my neighbors, however, says that silage is going out of use; that the farmers in New York State are giving up their silos, as the milk condenseries and the butter factories, as he claims, will not accept milk from cows that are fed on silage. Please tell me what there is to this. J. B.

The reports which reached you regarding the use of silage are exaggerated. It is true that Bordens have refused to accept milk made from feeding the average grade of silage. Our understanding is that they would be willing to accept silage made from inspected or approved silos. Most of the other condenseries seem willing to use milk made from silage, and there can be no question about the great economy in this kind of feed. It is the cheapest and best dairy food for Winter feeding now known, and instead of falling off, its use is certainly increasing through the dairy districts. Of course, you will understand that there is both good and poor silage. The quality depends upon the character of the corn, whether full, rich, immature or frosted, and also upon the way it is put into the silo, and the character of the silo itself, but as a general proposition, the use of silage as a dairy food is growing rather than falling off.

There are arguments for all kinds of silos of wood, concrete, brick, hollow tile or concrete blocks. The arguments which come to us for these various kinds are not unlike the arguments put up for different breeds of stock. One farmer will insist that his silo is better than any other, while within a few miles a man with a silo of very different type will argue very strongly for another kind. In northern Ohio, for example, the reports are that the old-fashioned square wooden silo is preferred. We hear from other dairy districts where farmers put up concrete silos entirely, and it is evident that all the other forms are in use and are being erected every year. The majority of dairymen who have used silage for a term of years would say that they would go out of business rather than attempt to make milk without a fair amount of silage.

Raising Veal Calves.

The Farm Management Monthly of the Agricultural Department gives a report from M. O. Cooper which will interest dairymen. This question of calf raising is a big one just now, with the high cost of meat. Some dairymen say that a good-sized calf will pay more for their milk than the dealers offer, but this experiment does not show great profit from small Jersey calves:

Some men hold that it pays to raise the male calves for veal, while others kill them at birth. There are here presented the actual figures on the cost of raising four Jersey calves on a dairy farm in Wisconsin, and although the number is small the figures are suggestive.

COST PER HEAD FOR FOUR VEAL CALVES.

	Total	Per Hd.	Cost
Whole milk...	804 lbs.	201 lbs.	$3.40
Skim-milk	2791 lbs.	698 lbs.	1.66
Grain	224 lbs.	56 lbs.	.86
Hay	120 lbs.	30 lbs.	.15
Eggs	22	5.5	.07
Labor	46 hrs.	11.5 hrs.	1.84
Total			$7.98

The four calves when sold were 12 to 16 weeks old, which is a little older than skim-milk veal is commonly marketed. During this period the quantity of feed consumed and hours of labor required and their value are presented in the above table. The prices used in computing feed and labor value were: whole milk, $1.70 per cwt.; skim-milk, 25 cents per cwt.; grain, $1.50 per cwt.; and man labor, 16 cents per hour.

By examining the figures it is seen that almost half the total cost is made up of new milk, although a comparatively small quantity of this feed was used. On this same farm the previous year the young calves that were being raised received 342 pounds of new milk. Had these calves received a like quantity the cost per head would have been increased $2.40, making the total $10.38. The major part of the feed used was skim-milk, but as this is a comparatively cheap feed its cost is not high. The other important item making up the total cost was labor, which amounted to $1.84. The total of $7.98 as shown by the table does not include some items which must be included in making up the complete cost of raising the veal. These items are building charges, equipment charges, interest, and general overhead expense. However, the total of these would amount to only a few cents, and for all practical purposes can be omitted without affecting the final results. The four calves were sold on the market for $42, which is an average of $10.50 per head. This is a profit of $2.52 over the cost of feed and labor. As these calves were the Jersey breed, they were not especially adapted to making into veal. The breed is small and the calves at birth weigh much less than the calves of the Holstein breed. At the same time, their feed cost is comparatively lower. It is probable that the profit from Holstein veal would be larger.

THE second annual meeting of the New York State Breeders' Club was held at the Powers Hotel, Rochester, N. Y., February 5, in connection with the annual convention of the New York State Breeders' Association. The purposes and objects of the club are to promote and stimulate purebred draft horse breeding with the assistance and promise of such State laws for the protection of owners and purebred draft stallions by method of inspection and license to govern service. The following were elected officers for the ensuing year: President, E. S. Akin, Glens Falls; secretary, E. E. Horton, Binghamton. A large increased membership was enrolled showing renewed strength and prosperity and with the promised State assistance a better condition of draft horse breeding for the State of New York may be assured.

"THE men will have to rainbow their whiskers and hair," said the fashion leader. "But how about me?" replied the smoothshaven, baldheaded man. "I can't rainbow; I'll have to Easter egg."—Washington Star.

SAVE-THE-HORSE

(Trade Mark Registered)

THE TIME IS NOW

All the winter long, the troubled owner of a lame horse reads our advertisements. Then, day after day slips away, while he talks, laments, listens, takes advice and hesitating—FAILS TO ACT—till the Springtime is on him and his horse is not yet able to work. Meantime the thrifty, prosperous, resolute man, reads, considers the evidence carefully—Decides Promptly—and his horse is working in, say, ten days to two weeks. That's exactly what happens every winter.

We Originated the treatment of horses by mail—Under Signed Contract to Return Money if Remedy Fails—and every minute of every day for Eighteen Years our advice and treatments have been on the way wherever mails go and horses are. Our charges are moderate. Spring work is near; Write.

Our Latest Save-The-Horse BOOK is a Mind Settler—Tells How to Test for Spavin—What to Do for a Lame Horse—Covers 58 Forms of Lameness—Illustrated. But write describing your case and we will send our—BOOK—Sample Contract and Advice—ALL FREE—to (Horse Owners and Managers—Only.)

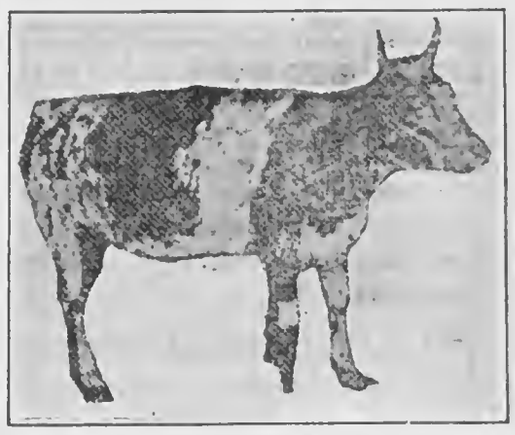
THE RURAL NEW-YORKER
333 W. 30th St., New York City

Heifer With Wooden Leg.

This heifer was found in the pasture with her right foreleg broken below the knee. The leg was first set by a veterinary surgeon, but it did not knit properly. The heifer was then etherized, the bone amputated, leaving enough below the knee to be fitted into a leather socket. Iron splints were attached, the lower ends of which were fitted into a wooden peg having an iron shoe at the



HEIFER WITH WOODEN LEG.

end. This operation was a success, and the animal is now able to walk about as well as usual. W. D. G.

New York.

Practical Dairying Advice.

Pasture is the most expensive way to keep a cow. This is the opinion of a prominent Ohio dairyman. He states that pasture is only at its best six weeks out of the year. On the other hand an acre of good silage should keep a cow 500 days. It would require three acres of pasture, and many farmers are using more for each cow. Two to three acres of exceptionally good pasture are required for each cow, and if that two acres were placed in a silo, it would not only provide succulent feed for a few weeks, but would supply the cow with good succulent feed upwards of three or four years. "There are many farms," he said, "with an acreage of hilly or wooded ground which affords pasture, but there are thousands of farms in Ohio and many other States which have open pastures, free from stumps and stones, which would pay the farmer dollars and cents to tear away the old fence rows, build new fences and put this acreage into silage."

"It don't pay to jump from one breed to another, or to try to cross breeds," is the opinion of a prominent corn belt farmer. "I have paid dearly for my rattling around in a box as far as breeding is concerned. Stick to your breed, and if you think that you are going to get what you want by cross-breeding, have your mind made up to live two centuries to win out."

A sow may be in the scrub class as well as a cow, and neither should be tolerated, is the opinion of one successful breeder. He figured from the dollar and cents point of view on three sows. Strange to say the sow that produced the largest number of pigs produced those which made the greatest gains during the six months, and the sow producing the smallest number, also produced the pigs which made the poorest showing at the end of six months. His first sow produced eight pigs, his second seven and his third sow six, same sire used. Each of the second sow's pigs returned him $1.81 less than the first sow's pigs. Each of the poorest sow's pigs returned $3.09 less than the first sow's average pig. He sat down and figured further. Why not have all sows measure up to the best one on the farm? He found he was out of pocket on the third sow a little over $25, and on the second sow a little over $37, compared with the best. He says the best is not too good, and why not put in a good sow in place of the "charity patient" which will clip the year's balance from $20 to $40? "Swat the scrub sow." W. J.

Many farmers utilize their clover fields for hog pasture early and later in the season, but in the middle of the Summer there is a time when hogs are short of pasture. Mr. Nicodemus of Van Wert County, Ohio, in his institute work advises the following: Sow half bushel each of rye and barley, then sow about four pounds of Essex rape to the acre. This should be started early in the Spring, and the pasture will care for 20 to 30 Spring pigs to the acre nicely. The pigs will not wallow nor tramp it down, but will make paths through the pasture. About the time the oats come in head is the proper time to turn in on the pasture.

SHE was a little girl and very polite. It was the first time she had been on a visit alone, and she had been carefully instructed how to behave. "If they ask you to dine with them," papa had said, "you must say, 'No, thank you; I have already dined.'" It turned out just as papa had anticipated. "Come along, Marjorie," said her little friend's father, "you must have a bite with us." "No, thank you," said the little girl, with dignity; "I have already bitten."—Tit-Bits.

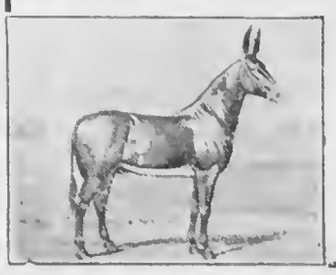
Percheron and Belgian Stallions and Mares
on sale. My exhibit comprises the largest number of big, heavy-boned, 2000 to 2400 lb. stallions to be found in the United States. The Cedar Rapids Jack Farm is the jack metropolis of the world. All nations buy jacks here. The majority of the best mules in the United States are the results of the past twenty years improvement inaugurated and carried on here. Write for catalogs. Come to me when you need stock. I will make it worth your while.



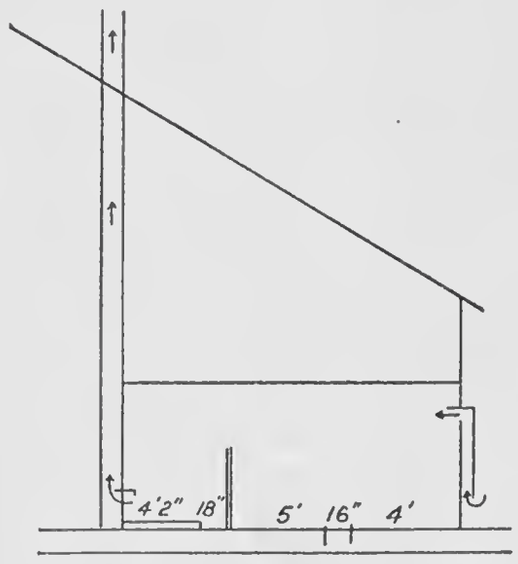
W. L. DeCLOW, Stallion and Jack Importing Farm, Cedar Rapids, Iowa

Making a Sanitary Stable.

I am working into a herd of registered Holstein cattle, and am going to build a shed on to the side of my barn, 16x36. Building in this way is cheap for the amount of room one gets, also handy for feeding out of barn. I would like to have proper height of stable below, also good plan for inside arrangement, width of feeding alley in front of cattle, length of stall, etc., with general directions for finishing interior of stable. If mangers and floor space for cows to gutter is made of cement to fit present stock, would there not be likely to be trouble later with young stock and new cows being too short or too long? Could the King system of ventilation be installed successfully in such a stable? If so, please describe method of installing. I wish to make a good sanitary stable, one that will be warm and comfortable. The barn is 60 feet long, and I shall continue the shed the whole length, using 36 feet for stable, the remainder an open shed for manure. C. H. W.

Michigan.

The greatest objection to the shed stable with manure shed at one end, is that it shuts off light from one side and end. In planning a stable for milch cows three things must be kept in mind, comfort of the cow, sanitation and convenience. For convenience in the shed stable the cows must head towards main barn. Probably as good a division of the available room in the 16-foot stable would be four feet two inches for feed



SHED STABLE WITH KING SYSTEM OF VENTILATION.

ways, 18 inches manger, five feet platform, 16 inches gutter, and four feet behind cows. A few inches might be taken from the space behind cows and added to feedway if desired. The platform on which cows stand should slope slightly toward gutter. The floor, manger and all, should be of cement.

The distance between standards and gutter may be five feet at one end of the stable and four feet six inches at the other end. This will accommodate large and small cows or heifers. Cows can be taught to take their places in that part of the stable most suited to their length. The King system of ventilation is perfectly feasible in the shed stable and should be installed. To make it operative the entire stable walls, doors, windows, etc., must be tight. The ventilating flues would better be on the inside of the main barn, and should project through the roof above the highest point, or it can follow the rafters to the peak and project a foot or two above. The flue must be tight. See cut above.

The 36-foot stable will accommodate nine or 10 good-sized cows, and for this number one ventilating flue 10x20 inches will be sufficient. Several intakes should be constructed, so that direct draft will not blow on or over cows. Their combined capacity should be equal to that of the ventilating flue. Provision should be made for the control of ventilation. Secure all the light possible. If it could be arranged so that sunlight would fall on all the floor space at some time during the day it would be ideal. Provide water of moderate temperature either by drinking cup in the stable or trough in covered barnyard and manure shed. A dairyman of my acquaintance recently put water in his stable and testifies that the same cows (18 of them) with the same feed and care, after eight days were giving 31 quarts of milk per day more than before making the improvement; big interest on the investment.

The cow on pasture in the early Summer months, makes the largest and cheapest production. The conditions which make possible the heavy production at this time are, aside from succulent nutritious food, freedom in pure warm air, sunshine and an abundance of pure fresh water at desirable temperature. We should as nearly as possible approximate these conditions in the stable. F. L. ALLEN.

Garget.

A cow is due to freshen in about four weeks. As yet I have been unable to dry her up, although I stopped milking her regularly over a month ago. Every few days two quarters of her udder become caked and swollen, and what milk I get is thick and lumpy. I am afraid she will lose that half when she freshens. What can I do? H. D. S.

Do not attempt to dry off milk flow. Treatment to that end has caused garget and it will ruin the udder unless successfully remedied. Milk her out clean three times a day and then rub in a mixture of one part each of fluid extract of belladonna leaves and poke root and six ounces of camphorated oil. The mixture will tend to check milk flow, but all fluid that forms should be cleanly removed from the udder. A. S. A.

Ringbones.

I have a mare with bunches on her hind feet resembling ringbone. They have been growing for two years, and have never been doctored. Is there any cure or help for them? Z. F. W.

If the enlargements do not cause lameness let them alone; if lameness is present clip off the hair and repeatedly blister the ringbones one at a time, at intervals of three or four weeks, while the mare is kept in her stall. Use cerate of cantharides for the blistering. It would be better, however, if you could have the ringbones puncture-fired and blistered by a graduate veterinarian. Do not breed from a mare or stallion afflicted with ringbone. A. S. A.

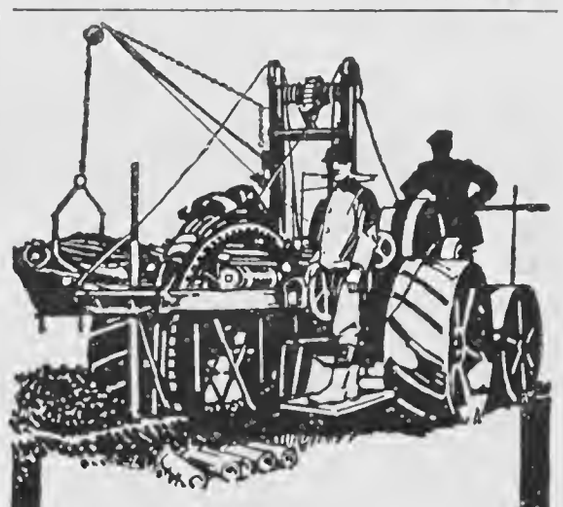
Ringworm.

I have a pen of five yearlings in good condition. They have what I call barnyard itch; it first appears over the eyes, hair comes off and looks like warts. One the hair is all off along the back. I feed corn fodder and hay and let them out to exercise every day, they have good clean water to drink. What is the cause of this itch and what can I do to stop it?

New York. W. R.

Ringworm is due to the vegetable parasite, tricophyton tonsurans, which lives on damp walls, woodwork, fences and feed racks as well as on animals. To get rid of the pest it is necessary to clean up, disinfect, whitewash, sunlight and perfectly ventilate the stables. Treat spots about the eyes and face by scrubbing clean with soap and hot water and when dry rub in a little iodine ointment each other day until well. Treat spots on body by scrubbing clean and then applying, as often as found to be necessary, a solution of two pounds of sulphate of copper to the gallon of water, used as hot as the hand will bear.

A. S. A.



Tile Drainage makes Worthless Acres pay

MANY an acre that is now worth nothing can be made as productive as any land in its neighborhood, by a judicious investment in tile drainage.

Tile Drainage makes land more fertile, it lengthens the tillage season and it is a protection against drouth.

BUCKEYE TRACTION DITCHER

A perfect trench at one cut

This remarkable machine is in use all over the country and has been for years. With it one man can dig up to 150 rods of ditch a day and every foot of it will be of proper grade.

Improve your own farm and at the same time make good money on the side after seasons.

Figure out where you can use tile drainage and size up your neighbors' farms. Then write for the Buckeye Book of Facts. No. 90.

DE LAVAL
Cream Separators
are not the mail order or agricultural implement kind

THERE ARE SEVERAL kinds of cream separators, but De Laval Cream Separators are of a kind that puts them in a class by themselves.

DE LAVAL CREAM SEPARATORS are made by the best engineers, with the best equipment, from the best materials, by the best workmen, and in the best shops of the kind in the world, all devoted solely to the production of the best cream separator.

THEY ARE NOT THE KIND of separators mail order houses contract for wherever they can be made cheapest, nor the kind that agricultural implement concerns manufacture along with corn shellers, plows, mowers, reapers, threshers, gasoline engines, cow milkers and the like, none of which begins to compare in mechanical quality or refinement with what the cream separator should be.

DE LAVAL CREAM SEPARATORS are the kind 98 per cent of the creameries use, where any loss in quantity or lack in quality of product means business ruin, as it always has ultimately to every creamery that did not replace an inferior separator with a De Laval.

PRECISELY THE SAME KIND of differences exist in farm as in factory separators and precisely the same reasons apply to the use of cream separators on the farm as in the creamery, though they may not make or break the farmer as they do the creameryman where the farmer has other crops and products upon which to rely.

THE DIFFERENCES BETWEEN De Laval and the mail order and agricultural implement kind of cream separators are fully set forth and made plain in a De Laval catalog to be had for the asking, while the machines themselves best tell their own story placed side by side, and that every De Laval local agent is glad to afford any prospective buyer the opportunity to do.

If you don't know the nearest De Laval agent, simply address the nearest main office as below.

HANDLE THE COW'S UDDER.

Many men are fine judges of cows, so far as pedigree or breeding and points of conformation are concerned, but they forget a most important matter when examining a cow. They neglect to make a critical, manual examination of the udder. This is all-important, and never should be forgotten. Beginners should bear that in mind, for the udder decides in great measure how profitable the cow will be for dairying. When the writer was a student at a veterinary college in Scotland 'way back in 1886, he visited a dairy farm with his brother students for the purpose of examining and studying types of dairy cows. He had learned a lot about such things as bone spavins and ringbones, and so stopped and said, "My, my! It's too bad that cow has such a big bone spavin!" when he noticed an animal so affected. Then the old, experienced dairyman exclaimed: "Hoot, toots! Never mind the spavie; she has a grand mou' and poke!" meaning that she had a good mouth and udder. Buy a cow that has a capacious abdomen and strong wide, muzzle, but don't forget a big, sound udder is the chief desideratum.

Standing behind a cow see that there is no enlargement of the udder, high up at the back of the vessel. If an enlargement is there handling will find it to be hard and extending into the udder tissue. It is a tumor, and in all probability tuberculosis of the udder. We simply would not for a moment think of buying a cow with such a tumor, and noticing one would save testing her with tuberculin. See that each quarter of the udder balances its mate, and, so far as possible, prefer an udder that has the four quarters of about like capacity. Such cows are comparatively scarce, but they are the good ones. The forequarters commonly are poorly developed and the teats often are too close together. They should not fit into a tin cup, but be six inches apart, or thereabout, in each direction. That means a well-formed capacious udder.

But the handling is necessary. *Sit down and milk the cow.* Milk into the hand, from each teat and carefully examine, taste and smell the milk unless it is seen to be abnormal in consistency or appearance. If this is not done one may fail to learn that one quarter is giving poor quality milk, or pus, or stringy, or clotted, or bad smelling milk. If one does not milk the cow he will be unable to tell how much each quarter gives in comparison. If he milks he may find that one quarter gives good milk, but deficient in quantity, or that the foreteats do not give nearly so much as the rear quarters. By milking he will learn whether or not the cow is a confirmed kicker, or switcher, or one that voids her urine each time milking starts, or one that holds up her milk. He will also learn whether the teats are of such size as to make milking a comfortable and easy matter, and whether or not she is an easy milker, or a stripper or a "sprayer." Then too one finds out about supernumerary teats, fistulæ or false openings of the teats, warts, sores, chaps, cracks, cow-pox, pimples and all sorts of things of that type.

But this is not enough. One should massage every portion of the udder after milking. Hard lumps and masses mean that the cow has had one or more attacks of garget and that being the case such a cow will be certain, sooner or later, to have a recurrence of the disease and lose the function of her udder. The cow may be for sale for the reason that her udder is unsound, and one wants to know that before he becomes the purchaser and has no recourse. It is perfectly possible to detect the trace of even a slight attack of garget. If one has practice his hands will detect the slightest departure from normal feel and consistency of true milk gland tissue, compared with tumor or scar tissue resulting from disease. The big, fleshy udder that does not shrink and hang in folds after milking is the wrong sort of vessel for milk production. It is too meaty, and not made up of true gland tissue which makes milk. Milk-making gland tissue is beautifully soft, elastic, mellow and pliant, and is covered with satiny, soft, fine-haired, elastic skin. Such gland tissue forms the "dishrag udder" which is of large size when distended with blood and milk and perfectly collapsed after milking.

It is poor policy to buy a cow that has a lump or hard mass in her udder, or one that has abnormal milk in one quarter or more. The "three-teater" cow is a nuisance. The cow that has abnormal milk is a source of dire danger in the stable; for udder troubles, in their worst form, are terribly contagious and the contagion is carried by the milker's hands and is contracted from contaminated floors and gutters. Never buy a cow that has any unsoundness of the udder and make it the invariable rule *instantly to isolate any cow that has anything the matter with her udder* and keep her away from other cows until she is perfectly well. If this were done udder troubles would become comparatively rare. At least do not be foolish enough to buy an unsound udder. Even with the best of care udders are liable to go wrong and we know of nothing more vexatious and unprofitable to the dairyman. A. S. ALEXANDER.

WHY DOESN'T THE BUTTER COME?

J. C. G., on page 319, is in trouble because it takes so long to churn. A minister's wife once wrote to a dairy editor, saying their cow was expected to calve in three months, but still gave a large mess of good milk which was very hard to churn. She treated her cream exactly as she always had done, and churned at the usual temperature, but the butter would not come. The editor replied that it was a common complaint that the cream of cows that had been a long time in milk, was hard to churn, and that there were several remedies, which dairymen believed to be more or less effectual; but her best plan would be to trade her cow to one of the deacons for a fresh cow; that if the deacons would not trade, then try some of the world's people. The story ends right there, but if the woman succeeded in trading for a fresh cow, she probably churned in 15 minutes.

In our dairy we have never had any difficulty in churning even when we had no more than one fresh cow in a herd of 14. The one fresh cow supplied "the leaven that leavened the whole lump"; or more properly speaking, furnished the globules of butter that were sticky enough to make all the others adhere in a solid mass. In our experience with difficult churnings, the butter "comes" or separates from the buttermilk, but will not "gather." The little particles will not stick to each other, but remain floating in the froth. We have had cases where butter globules, nearly as large as birdshot, and as round, would not adhere to each other, and I skimmed them out into a clean muslin sack, squeezed out the butter-milk, emptied the mass into the butter bowl, and with the ladle worked it into as fine a roll, as was ever placed on table.

Keeping the cream until it was loppert, as well as sour, and then churning at 70 degrees, we have found to be an advantage. The butter will be whiter for churning so warm, but a little color put with the cream before churning will make it yellow enough. The old remedy for a hard churning (when witches were believed in) was to throw into the churn a red-hot horseshoe, to exorcise the witch. A neighbor says that a quart of boiling water will answer the purpose just as well as a horseshoe, for he has tried it.

Some dairymen say that the feed of the cows is responsible for the hard churning—that the trouble is caused by unbalanced rations. Moldy cornstalks, turnips, half-rotted cabbage, or garlic when eaten by the cows might give the butter a bad taste, but I think would not make it come any harder. One writer thinks that too much ripening of the cream, or keeping it too long before churning, is the cause of hard churning. Our experience is that if the cream is kept in a cool place, it can be held a week without ripening any too much for easy churning, and in the Winter it must be brought into a warm room for a day before churning, in order to get it sour enough.

Mix Your Own Feed!

It Pays in Beef and Milk

We have issued a big, new ration book for dairymen, feeders and stock raisers, giving information of untold value about linseed meal, the cheapest and best feed for cattle and all other kinds of stock.

Send the coupon for your reply—get posted on **protein value**, the flesh-formin milk-producing and mild laxative qualities of this extremely rich and highly digestible feed.

HYPRO Linseed Meal

36% Protein Guaranteed

No "ready mixed" feed compares in **results** with HYPRO Pure Linseed Meal, mixed to meet your particular feeding requirements. The HYPRO brand is the best and purest—the highest grade flaxseed grown. Pure, unadulterated linseed meal—guaranteed to contain 36% protein.

Remember that the way to buy feed is in **units of food value**—mere **bulk** means nothing.

You get **known value** and **balanced rations** that keep your stock in a thrifty, profit-producing condition when you buy HYPRO Pure Linseed Meal.

Used in connection with skimmed milk, it's the best substitute for whole milk in existence. Enables you to keep your calves and raise them profitably.

Insist on the HYPRO LABEL and get **the real thing.** Don't risk unknown kinds of linseed meal. The prize cattle of the world are invariably fed on linseed meal. The prize brand of linseed meal is HYPRO.

Write Us for the Big Free RATION BOOK

Send the coupon or a postal without delay for this wonderful book. Get the rations used and recommended by the foremost dairy experts and scientific feeders. This book points the way to better feeding and bigger bank accounts. Gives rations for dairy cattle, beef cattle, swine, sheep, horses and calves. Tell us the number of cattle and other animals you are feeding and give us the name of your dealer. Do it today.

What You Do When the Pail is Full

Change the cover. Don't stop the machines milking—that would be a loss of time. Weigh and record each cow's milk—that's the Hinman way. Everything runs smoothly and silently. The first you know the milking is over.

The HINMAN Milker

Don't think that the Hinman is made only for the big farmers. It's a money maker for dairies of all sizes from 10 to 400. Every owner will tell you proudly "It's a Hinman." They milk every time—always on the job. Cheaper than hired help.

Milking in Silence Means Dollars

Cow-contentment and thoroughly scientific milking make the big records. That's why such dairymen as Jno. Garrow, Morenci, Mich., uses the HINMAN when putting his heifers through the advanced registry.

A few of the many features found only in the Hinman: Each machine separate; no vacuum in pail; rapid-pail-changing idea; visible milk flow; no piping—just a simple drive rod; only two moving parts.

Changing HINMAN Pails

Say the word and we'll mail you our catalog. It will help you to understand why the Hinman milks 65,000 cows daily under greatly varied conditions. Agents everywhere.

MAPES THE HEN-MAN GIVES FIGURES.

PART I.

Having put a good deal of good money and work into hens, and not having been able to get a balance on the right side thus far, I have been much interested in the reports of those who have succeeded in making poultry raising pay, notably Mr. Mapes. On page 162 I note "Hens vs. Cows." I should have been glad to have a more definite statement as to the net profit; $5,000 gross from 1,800 birds seems very moderate, but expenses (including interest on investment and depreciation) would on many plants eat most of that up, and leave very little for labor of the owner. I note that the stock has been increased by 800 birds, valued at $500; again a very moderate estimate. But I should like to know the ages of the birds, i. e., how many pullets, how many yearling hens, and how many two years old? The limit usually placed on profit for hens is two years—the pullet year, and the so-called yearling year. If Mr. Mapes runs his plant on that system he would have to replace 900 birds (or else allow a heavy depreciation per capita on the value of his fowls) besides the 800 increase. That would mean that unless he is more successful than most poultrymen in raising birds he would have to hatch 5,000 chicks or more to get the required number of pullets good enough to keep for layers. Again, unless he does better than the average, that would mean incubating about 10,000 eggs.

But granting that he had phenomenal success, incubated 5,000 eggs, hatched 4,000 chicks, and brought 1,700 pullets to maturity. I would like to know how one man could do this and care for 1,800 hens—even having this so systematized that it all could be done with the least possible effort. I should also like to know how much capital (including all labor in erecting houses, fencing, etc.) has been invested in land, houses and all the equipment required for hatching and raising chickens. Then we can estimate more correctly what Mr. Mapes receives for his labor; and what is vastly more important to those of us in the business, we can see where we can improve our own methods, and have one balance on the right side of the sheet. C. G.

Southboro, Mass.

Having roused the curiosity of readers I suppose they are entitled to the rest of the story even if it does make "the cow look like 30 cents beside the hen." The above correspondent is evidently traveling along the beaten path so thickly strewn with failures that never arrived at the terminus for which they started. A glance at the picture accompanying the article in question will show that I have left the beaten path at many points, and blazed a new trail. In no other way could I have accomplished what to many doubters seems as incredible as a trip by water from New York to San Francisco in the time that will be necessary after the completion of the Panama Canal as compared with those following the course around the Horn 20 years ago.

Note first that not a dollar is invested in poultry runs or fences. These are always a source of annoyance and expense. Note that the roofs are all of the steep type, and less liable to decay and loss than the ordinary flat-roofed poultry house. There is only one small window (rear view) to each flock of 250 hens, to be kept glazed, making four to each 1,000 hens. Poultry-house windows, like fences, are always a source of expense. There are only 150 feet of siding per unit, or 600 feet per 1,000 hens to be painted. The low inside walls are of concrete and practically permanent. Other departures from the beaten path are not shown in the picture.

I do not dispose of my layers at the end of the second year's work. A six-year-old cow will raise as many calves in a year as a three-year-old. Only fools or millionaires would sacrifice their milkers at the end of the second year's work. Aside from the time required to moult, a five-year-old hen should lay as many eggs as a pullet, and larger ones.

Other requirements of the beaten path call for frequent visits to the henhouse to throw them a little of this or a little of that, in deep litter, in order to make them exercise. Some recent mechanical devices try to accomplish the same result. The exercise fad is largely "bosh." I throw what I think is a proper allowance of mixed grains for the day to them in the morning, not being very particular whether the litter is deep or not, then go about my business and let the hens do the same. The dry mash hopper is always open to them.

We have a local feed dealer who has a feed mixer and one of the best formulas I know for both dry mash and mixed grains, so I buy all my feeds ready mixed and delivered in my feed room. His heavy trucks can haul it four miles cheaper than I can do it with a light team. Much time is often consumed on many poultry plants mixing or hauling grains, mashes, etc. When my supply begins to get low all I have to do is to lift the telephone receiver and that sets in motion the machinery that replenishes it.

In most of the "failures that strew the beaten path" an expensive house devoted exclusively to brooding is found in the foreground. Notice the entire absence of such buildings in the picture.

Now for the "facts and figures." I have 10 buildings, including the original "hen barn," devoted exclusively to poultry. These have cost me, including labor and watering system, about $2,600. Four incubators purchased second-hand more than 10 years ago cost me $90. They are still doing good work, and the only expense for repairs thus far has been for one new burner and a few pieces of felt. Two brooding outfits that cost $58 each completes the outlay for equipment. Add another $100 for say two acres of land (without buildings) and we have $2,916. Make it $3,000 for good measure. O. W. MAPES.

A DARKY employed as an office-boy in Kentucky came to work one morning with a face that looked as though it had been run through a meat-grinder. "Henry," demanded his surprised employer, "what in the world happened to you?" "Well, suh, boss," explained Henry, "I got into a li'le argument las' night wif another nigger, and one thing led to another twell I up and hit at him. Well, suh, it seemed lak dat irritated him. He took and blackened both of mah eyes and bit both of mah years mighty nigh off, and split mah lip and knocked two of mah teef loose; and den he th'owed me down and stamped me in de stomach. Honest, boss, I never did get so sick of a nigger in mah life!"—New Orleans Picayune.

"Can't-Sag" Gates Save You BIG MONEY

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long

Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature—reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

Chicken Pox.

Among my flock of White Leghorns, I have had some break out about the head and eyes and on the wattles with dark colored blotches. It appears to be a contagious disease, as one follows another with it. They eat and drink all right, and I know one infected hen to be laying regularly. So far only one of those infected has died, and I found her where she had apparently fallen from the perch. I have five or six other breeds, but the Leghorns seem to be the only ones infected. I have the diseased birds separated. Could you tell me name and remedy of the disease? E. Q. G.

This eruption may be that of chicken pox, though you do not describe a typical chicken pox eruption. In any case, anointing the sore spots with 5 per cent. carbolized vaseline will be good treatment, as the disease is evidently contagious, and the germ is very likely to have its origin in the eruption. You should continue to keep all affected birds isolated until the disease has run its course, and should, in addition, disinfect all utensils used by the ailing flock.

M. B. D.

Conditions in Egg-Laying Contest.

Will you give size of runs the hens have in the egg-laying contest? I would like a detailed account of how they do it. Perhaps they issue a bulletin; if so where can I get it? D. H. W.
Macksville, Kan.

Replying to D. H. W. would say that the runs are about 15x30 feet, and are sown with oats, barley, etc., and the hens kept out of them until the grains get a good start in the Spring. The fowls are fed whole grain in the litter in the morning, to induce exercise, the grain hopper being closed when the last round is made at night. This scanty feed in the morning also tends toward their eating more of the dry mash, which is always accessible. At noon the whole grain feed hoppers are opened, and the hens can go to roost at night with full crops if they wish to. The feed hopper used has a cam on the bottom which can be opened to let out a handful with each turn of the feed-bar, or so graduated as to let out only two or three grains. This "feed-bar" is a tube of wire netting about 1½ inches in diameter and six inches long. It is filled with cracked corn, wheat, oats, etc., and as the hens pick at the grain, it moves the bar, and that lets fall a few grains from the grain holder above. It is interesting to note how quickly the hens learn that it is *the movement of the bar, that lets down the grain;* they don't pick at the grain visible in the wire tube, but put their beaks on top of the tube and give it a whirl, just as well as a man could. I have the same kind of hoppers in daily use in my henhouses, and like them very much.

The bulletins of the first and second egg-laying contest are to be published together. These will give all the data one can ask for, the weight of each hen's eggs, the amount of food consumed in each pen, food cost per egg, total number of eggs laid by each hen, etc. I will notify readers of THE R. N.-Y. when the bulletin is ready. GEO. A. COSGROVE.

Crowded Hens.

I have 23 R. I. Red pullets, 25 Plymouth Rock pullets, seven old hens and three cockerels in a coop 8x12 feet. The coop faces the east and has two windows and a door. One window has muslin over it and the other has been open all the time when not too stormy. I keep gravel, oyster shell and charcoal in the coop at all times. I throw their feed in a deep litter of straw and chaff in the forenoon; feed two quarts of wheat; at 2 o'clock in the afternoon a wet mash of three quarts of bran and one tablespoon of oil meal; at 4 o'clock 1½ quarts scalded oats and a pint of corn. I put two quarts dry bran in the dry mash dish; for green food I give raw beets or cabbage, all they will eat, and I give them from two to four gallons of thick sour milk per day and occasionally butter milk. I have not given them any water for about two weeks. I have had the chickens shut in the coop for about four weeks and they have been and are having a bad diarrhœa and are only laying about half the amount of eggs they were when I shut them up. If I am not feeding right I should like to have you tell me what to feed and what is wrong.
Buckley, Mich. R. M.

If, as I understand, you are keeping 58 fowls in a coop 8x12 feet in size, you are overcrowding them badly, and with all the sour milk and cabbage that they will eat, it is not strange that they have diarrhœa. I can only advise that you manage in some way to give them more room, as that number of fowls should have at least 180 square feet of floor space, if they are confined to their coop. Then, do not feed all the beets and cabbage that they will eat, but limit the amount, giving them perhaps one head of cabbage, or an equivalent amount of beets, every other day. I think that you will get better results, also, by feeding less often, and the labor will certainly be less. Two to three quarts of mixed grains in the litter in the morning, and about the same amount at night should suffice for the whole grain ration, and a dry mash of ground grains kept before them in a hopper will supply their needs in this line. If you prefer to feed a moist mash mixed with sour milk, this may be given at noon, in such quantity as they will quickly clean up without evidently "stuffing" themselves. Sour milk may also be kept before them, but it should not replace water; that is needed also. Corn, oats, wheat, and buckwheat, may all be used for whole grain, and you will frequently find formulas for mash mixtures in these columns. It is well to follow these as closely as possible as they are made up to properly balance the different kinds of food. Finally, if you cannot give the fowls more floor space, open the doors and let them go out and in at will, regardless of snow. M. B. D.

Two More Prize Turkeys.

I note on page 241 that F. C. S. has a Bronze turkey that laid 84 eggs last Summer. I have a purebred White Holland turkey that beat that record by far. She began laying early in April, and did not offer to sit until August, when I gave her a sitting of eggs which she hatched September 3, rather late in this locality; but we have had two of the young birds on the table and I have two more of the young hens that are doing well. The above mentioned turkey laid over 100 eggs in the season mentioned, the exact number was 102 or 103.
New York. WM. J. BERNHOFT.

In February, 1913, I bought two turkey hens and a gobbler, purebred Bourbon Reds. The hens commenced laying the second day of April on the bank of the spring run very near the house. They laid together in the same nest, a mother turkey and her daughter. The older hen laid 49 eggs and wanted to sit. I divided the nest, putting a large box open on one side over her, and the younger turkey continued to lay every day until she had laid 96 eggs. She then stayed on her nest two nights and skipped four days without laying. I decided to set her that evening, and she had decided to roost in a tree. The next day she laid again and continued until she laid 128 eggs. She then wanted to sit; I put 11 eggs under her, and she hatched nine turkeys and raised seven of them. I could easily tell the eggs apart, as the old turkey's eggs were a third larger and much darker in color. I sold several sittings of eggs to my neighbors, and raised 42 young ones out of a large number hatched. Last Fall I sold them for $92.27. I still have four hens and a gobbler for this year's turkey raising. This is my first experience with turkeys. I am in love with the work, and like F. C. S., with the Bronze breed, I surely think the Bourbon Reds are all right. FLONA HOENING.
Pennsylvania.

Pullets With Twisted Necks.

What can I do for a couple of pullets that have developed a very strange ailment in the shape of twisted neck? The neck is so twisted that the head a good part of the time is exactly upside down, and they seem too weak to hold it up, but have to sit a good part of the time with head resting on the floor. They eat well and at times can straighten up to walk around and eat, but if disturbed a little, they seem to get a spasm and lose all control of themselves, and often struggling and tumbling around awhile again drop their heads upside down on the floor.
New Jersey. H. Z.

This trouble is probably vertigo due to disturbance of the circulation in the brain; this, in turn, being due to intestinal irritation, as from the presence of worms in large numbers, or from indigestion. Blows upon the head, and exposure to the hot sun are also said to be exciting causes. Giddiness, a staggering gait, and peculiar movements of the head an neck, are evidences of this trouble. Treatment should be directed to any known cause. If the presence of worms is suspected, give a teaspoonful of turpentine mixed with twice its quantity of sweet, or olive oil. Repeat if necessary. Place the affected birds by themselves and feed upon soft easily digested food for a few days. In any case, a physic of one to two teaspoonfuls of castor oil, or two grains of calomel, will do no harm and may remove irritating matter from the digestive tract. M. B. D.

BEETS FOR HENS.—A few weeks ago I saw the question asked as to a machine for cutting up sugar beets for hens. Now I think that a machine is unnecessary as I am feeding some at the present time and I believe with good results and I simply drive a finishing nail into the wall of the henhouse about 18 inches from the floor and then taking a beet in my hand drive it onto the nail. The hens do the rest, and after a short time it is impossible to find anything left of the beet.
Madrid, N. Y. W. H. B.

Here is the Territory Where DAYBREAK ROCK PHOSPHATE Has Made Good

In each of the States shown on this map we have shipped "Daybreak" Rock Phosphate in car-load lots and a most persistent follow up of our customers has not found one who has not profited from his purchase.

Here are the crops which have been materially and profitably increased by the use of Rock Phosphate

Corn, Wheat, Oats, Clover, Potatoes, Silage

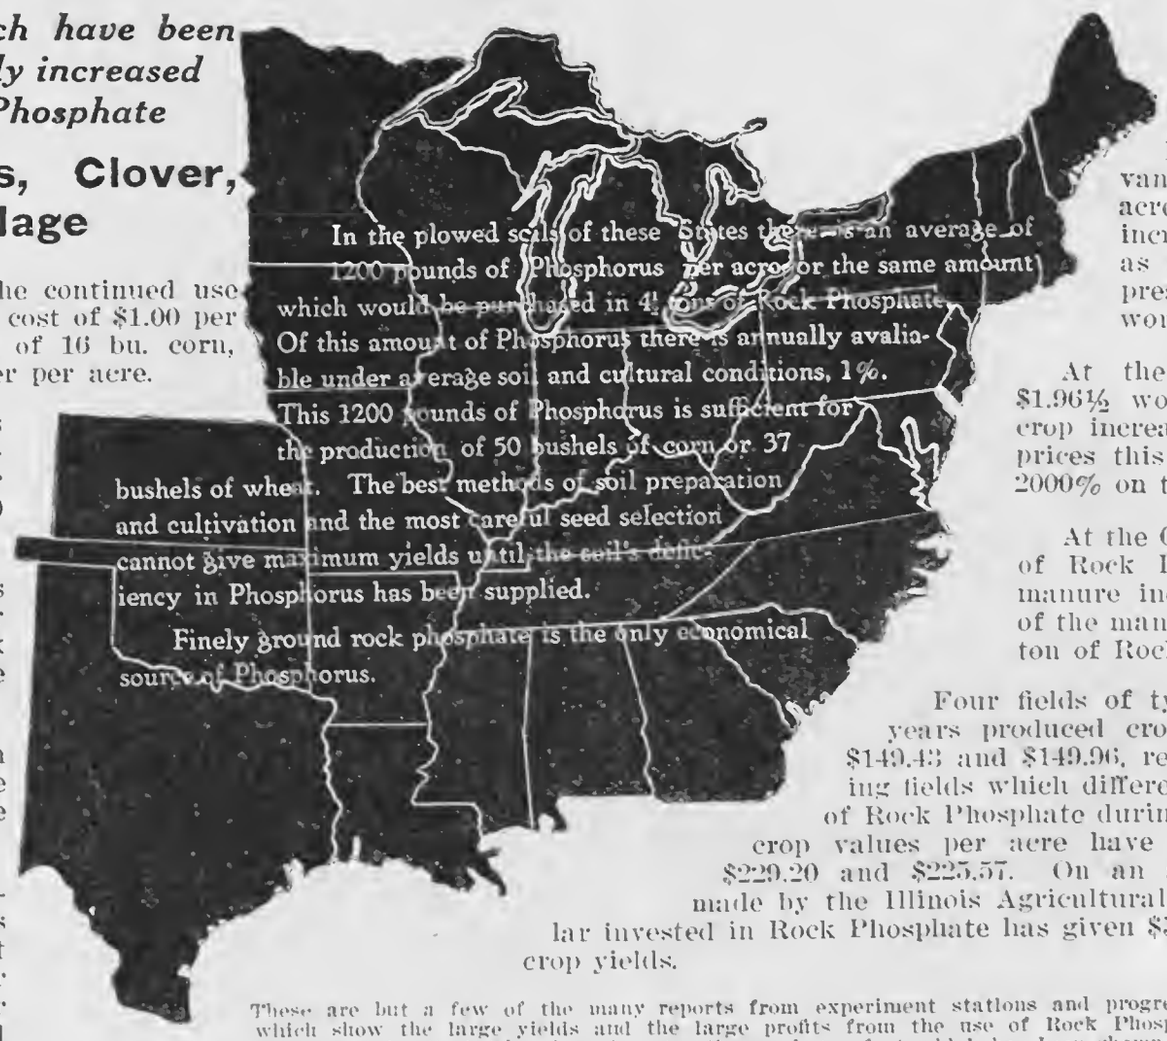
On a typical corn-belt farm the continued use of Rock Phosphate at an annual cost of $1.00 per acre has given increased yields of 16 bu. corn, 23 bu. oats and one ton of clover per acre.

In a recent issue of Breeder's Gazette there was reported an increase of 25 bushels of wheat per acre from an application of 600 pounds of Rock Phosphate.

Increased yield of 20 bushels of oats and one ton of clover per acre from 1,000 pounds of Rock Phosphate is reported in Prairie Farmer.

At the University of Wisconsin the use of Rock Phosphate gave an increase of 47 per cent in the potato yield.

The Ohio Farmer reports an increased clover yield of 2820 pounds per acre at the Ohio Experiment Station. The Rural New-Yorker reports 2652 pounds more of clover per acre from the use of lime and Rock Phosphate than from the use of lime alone. Prairie Farmer during 1913 gave reports from the use of Rock Phosphate on clover in five counties of Illinois. On an average Rock Phosphate doubled the clover yield. One of America's best known Jersey breeders reports an increase of 8 tons of silage per acre from the use of 500 pounds of Rock Phosphate.



What Rock Phosphate Has Done in Dollars and Cents

In a twelve year test at Pennsylvania Experiment Station $1.05 per acre invested in Rock Phosphate gave increased crop yields valued at $5.85 as an average of the 12 years. At present prices these crops would be worth $9.

At the Maryland Experiment Station $1.96½ worth of Rock Phosphate produced crop increases valued at $22.11. At present prices this increase would show a profit of 2000% on the Rock Phosphate investment.

At the Ohio Agricultural College 15c worth of Rock Phosphate added to each ton of manure increased the crop producing value of the manure 75c per ton. On this basis one ton of Rock Phosphate is worth $37.50.

Four fields of typical corn belt land have in ten years produced crops valued at $148.75, $151.30, $149.43 and $149.96, respectively. On four adjoining fields which differed only by two applications of Rock Phosphate during the ten year period the crop values per acre have been $229.37, $221.30, $229.20 and $225.57. On an average of all tests made by the Illinois Agricultural College, each dollar invested in Rock Phosphate has given $5.00 in increased crop yields.

These are but a few of the many reports from experiment stations and progressive farmers which show the large yields and the large profits from the use of Rock Phosphate. The soil's need for Rock Phosphate is not a theory, but a fact which has been shown by extensive soil surveys and analyses by state and nation. The use of Rock Phosphate is not an experiment, but a well established system of fertilization which is increasing the bank accounts of thousands of intelligent farmers and enabling them to make their soil permanently productive. Get the facts and you will get the profits. Fill out this coupon and mail it to us today.

Federal Chemical Co., Columbia, Tenn.

LEGUMES IN THE SILO.

Two years ago we decided that by putting cow peas and Soy beans in the silo along with the corn we could make a feed richer in protein, and not so much concentrated feed would have to be bought to balance the cows' rations. So in June several acres of cow peas were planted, and one acre of Soy beans, so that the two legumes would mature well enough and could be mixed with the corn going through the cutter. The Soy beans were planted in rows and cultivated so that they attained a growth of nearly four feet, and possessed a heavy supply of green pods filled with seed at the time of cutting. The cow peas too, possessed plenty of seed when put into the silo.

After filling the silo with a mixture of corn and cow peas the Soy beans were added near the top after the first night's settling, and consequently the first silage fed was a mixture of one-half corn, one-fourth cow peas, and one-fourth Soy beans, and possessed according to the feeding table a higher percentage of protein, but a lower amount of fat than does straight corn silage. The test at the manger however, was not as satisfactory as one could wish after going to the extra expense of growing the legume crops for silage. The cows did not give any more milk than when given a ration of corn silage, and it was necessary to feed as much cottonseed meal, apparently, with this mixed silage as with that entirely of corn. The mixed silage was more sour than ripe corn silage would have been, though the cows found it as palatable and ate it as greedily as they did ripe corn. However, there were a great many woody stems of the Soy beans that were left in the mangers.

The conclusions that we have drawn from our experience with legumes fed in this way, and other dairymen have reached the same conclusion, is that it is much better to feed all the legumes dry as hay and fill the silo with ripe silage corn. Wherever corn can be well matured on a few acres that have been fertilized until they will produce heavy yields of corn, the actual tonnage of silage per acre is much greater than can be obtained from the same land planted to any of the legume crops. The yield is enough greater to more than pay for the extra work of cultivating the corn crop, and the work of gathering the one crop of corn for the silo is much less expensive. One writer giving his experience with Alfalfa as a silage crop, states that it took from 10 to 12 acres of Alfalfa to fill a silo 12 by 30, the time necessary to fill it was four days, and the cost of filling, $2 per ton. Experience shows that to fill the same sized silo with corn silage requires only from six to eight acres of corn and the cost is never over $1 a ton.

Without doubt the expense of filling a silo with either Soy beans, cow peas or Red clover would be about the same as for Alfalfa and mixing them with corn undoubtedly raised the cost of filling from $1 to $1.50 per ton, to say nothing of the expense of seeding and the decreased yield per acre.

Last year we filled the silo with ripe corn silage alone, and are feeding the legume crops as hay. The grain bill is no more than formerly, the silage being well matured is much better feed for the hogs, and the pigs find more grain in the litter, in fact nearly enough together with their skim-milk to make them a balanced ration.

Legume crops, with their power to draw nitrogen from the air and deposit it in nodules on their roots, are valuable crops for the farm, and several of them should be grown if the fertility of the soil is to be maintained. However, for feeding purposes, farmers generally have found that the extra expense of putting them in the silo does not warrant their being used in this way to raise the protein content of the silage. For practical purposes it seems to be impossible for man to manufacture one single substitute for Blue-grass which during the early Summer is termed "nature's balanced ration." H. B. COBB.

Jackson Co., Ohio.

"WHERE'S your engagement ring, Margie?" "I've hid it. As long as George ain't sure he can get the ring back, he won't break the engagement."—Cleveland Plain Dealer.

Contagious Abortion.

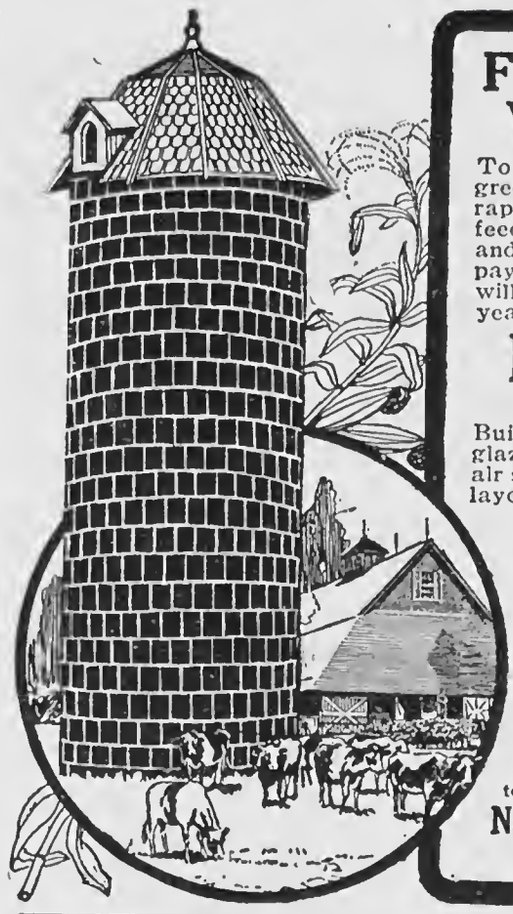
What will prevent further abortion among a herd of cows? These cows are in good condition and the owner is at a loss to account for three successive abortions. Can you explain the cause of abortion and remedy for the future prevention? N. R.

New York.

Where abortions frequently follow each other in dairy herds the cause may usually be traced to an infectious disease, known as contagious abortion. This disease is caused by a specific germ which obtains entrance to the circulatory system of the cow through the digestive tract or the reproductive organs. It causes the death and expulsion of the fœtus, and carries the contagion to other cows through the medium of the discharges and the milk. The disease is also carried from one cow to another by the herd bull. No certain cure for this disease has yet been discovered, though the use of methylene blue has recently been advocated, and good results have been reported from its use. Isolation of infected cows with disinfection of stables is necessary, and a competent veterinarian should be consulted when the disease has obtained entrance into a herd.

M. B. D.

"Do you understand what you are to swear to?" asked the court as a not over-intelligent looking negro took the witness stand. "Yessah, Ah does. Ah'm to swear to tell de truf." "Yes," said the judge; "and what will happen if you do not tell the truth?" "Well, sah," was the hesitating answer, "Ah expects ouah side'll win de case, sah."—Ladies Home Journal.



Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo

(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof — Decay Proof — Vermin Proof — Fireproof

The Natco Imperishable Silo will last for generations — any mason can erect it — never needs painting — walls will not warp or shrink — no hoops to tighten — no continual repair bills — the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog "L."

National Fire Proofing Company

Syracuse, N. Y.

Fills Your Silo Quickly With Less Power and Labor

You can operate this machine with a 4 h. p. gasoline engine. It's the lightest running blower type of ensilage cutter made—The *throwing, blowing, lifting force* carries the ensilage in a steady full stream rapidly up into the highest silo without waste of power The ensilage packs perfectly and keeps sweet and succulent. The

PAPEC ENSILAGE CUTTER

Is easy to set up and take down. Simple in construction not easy to get out of order. The entire frame is one solid piece of semi-steel. The bearings are always in line, run smoothly and will not heat. The feeding mechanism is geared to the main shaft—always gives you the desired length of cut. The *Papec Ensilage Cutter* is not chain driven, but has heavy gears which transmit *all* the power. It cuts ensilage perfectly and swiftly—as fast as you can bring the corn to the machine

Write for Illustrated Catalog. Send today for this book. It shows how The "Wonderful Papec" cuts ensilage with less power, time and labor.

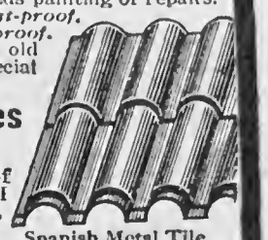
Rock Bottom
on the Very Best
Steel Roofing
Ever Made

This is positively the greatest steel roofing proposition ever made. Before you invest in new roof covering, siding or ceiling for any building you should first learn about the *one* best—by far the best from every viewpoint, and cheapest.

Reo Steel Shingles

Edwards *Tightcote* Steel Shingles

actually cost less and *outlast three ordinary roofs*—last a lifetime—when the building wears out you still have the roof—never needs painting or repairs. It is *rot-proof, fire-proof, rust-proof,* and guaranteed *lightning-proof.* Any one can lay it, right over old shingles if you like. No special tools or experience required.



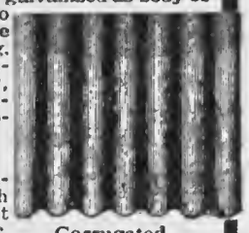
Spanish Metal Tile

Edges and Nail Holes Can Never Rust

Each and every sheet of Edwards Galvanized Steel Shingles, Roofing, Siding, Ceiling or finish is extra heavy galvanized, piece at a time, by our exclusive TIGHTCOTE patented process after sheet has been stamped and resquared.

Side and edges are as heavily galvanized as body of sheet. Means no weak spots to rust and corrode. Don't confuse with ordinary galvanized roofing.

By Edwards Patent Interlocking Device, see illustration below, all nails are driven through underlayer of metal only—no exposure—no leaks.



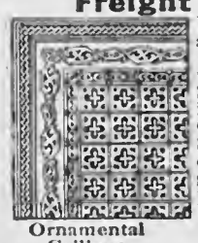
Corrugated

How to Test Galvanizing

Take any other piece of galvanized metal, bend it back and forth three or four times, hammer it down flat each time—then take your finger nail and flake off the loosened galvanizing. Make this same test with a piece of Edwards TIGHTCOTE Galvanized Steel Roofing—then note that the galvanizing is solid to the very edges—not a bit will flake off. Proves that not the space of a pin point can possiby be exposed to the weather and cannot wear out.

'V'-Crimped

Lowest Factory Prices Freight Prepaid



Ornamental Ceilings

We manufacture and sell all of the patterns of Edwards Reo Steel Shingles, Roofing, V-Crimped, Corrugated, Standing Seam, etc., painted or galvanized—or other building material direct from the largest and most up-to-date Metal Building Material Factory in existence, at rock-bottom factory prices. You keep the middlemen's profits in your pocket. We pay freight charges and give a permanent, binding guarantee against lightning losses—backed by our entire capital and resources.

This FREE Book

shows clearly the material to use—the future material—easily supplants other roofing. Send today for your copy of Roofing Book No. 373.

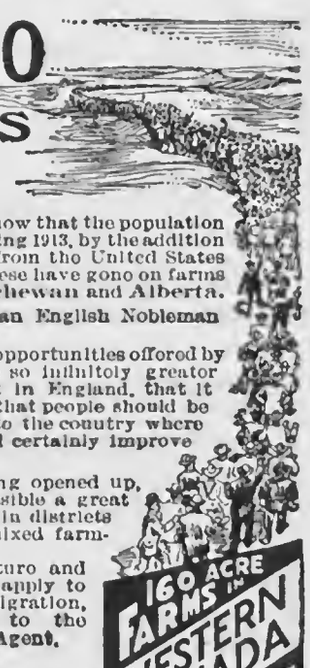
400,000 Settlers a Year



Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in **Manitoba, Saskatchewan and Alberta.**

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

CROSS-BRED HOGS AS BREEDERS.

Among a great number of farmers crossbred hogs are very popular. It is claimed that they are better feeders, and the men who always feed that kind are ever ready to enter into a controversy with breeders of purebred swine over the relative merits of the two classes of hogs.

There are so many things that enter into the breeding problem as applied to hogs that a man must be able to see the matter from a great many different angles. For instance, not only are the different breeds to be studied, but the strains of breeds as well. Perhaps a breed like the Poland-China is condemned because the breeder happened to start with small-boned hogs when he should have selected a big-boned strain of the breed. The results he obtained prove to him that back somewhere the hogs have been too closely interbred, when without doubt inbreeding has had very little to do with the fact that his small-boned Polands do not mature quickly into marketable butcher hogs. Then again, purebreds are often condemned because of some fault they develop that is plainly due to their lack of care and feed, and usually the man who thus condemns purebreds is the one who is a strong advocate of the crossbred hog.

The strongest argument for the crossbred hog is that cross breeding is the surest way to eliminate any chance of inbreeding interfering with the growth of the animal. From experience it is plain that cross breeding does produce pigs that mature quickly, at a minimum of feed cost, into well-matured hogs, producing excellent meat. Where the breeder is raising pigs to be sold at weaning time for feeding purposes in a neighborhood where crossbred hogs are popular, the practice of cross breeding is a paying proposition. However, the one cross from purebred sows and boars is all that is practicable.

One of the reasons why purebred swine are often condemned is because their environment, after they are bought by some new breeder on trial, is not what it should be. If purebred hogs are not given a ration well enough balanced with protein, they cannot show the best that is in them. Often this very lack of protein is the cause of some good strain of purebred hogs being condemned. Observation shows that where a herd of hogs is given every chance to produce bone and attain a vigorous growth, it is not to be compared with another herd, perhaps very closely related, but being fed a ration of corn with very little middlings, skim-milk or tankage to balance the ration.

Those who lay down the law of inheritance for us contend that environment plays a very small part in the breeding of live stock; that no matter whether an animal has the proper feed and care or not, if it is mated properly with other animals in its class it will pass on its inheritance from its ancestors to its offspring unchanged. It is hard to accept that theory, though it is no doubt true. However, as applied to swine, if a herd of big-boned hogs are kept for several generations by a poor feeder who keeps mature stock averaging less than 300 pounds, and I have seen purebred hogs matured at that weight due to lack of protein feed, it is quite possible that inheritance can be in this way indirectly influenced at least to the herd's disadvantage. For, if the breeder possessing such hogs, continually sees before him such low-grade purebreds, even though the hogs have the power to pass on a vigorous inheritance, the man's standards are lowered and he becomes less careful in selection of breeding stock, and eventually possesses a poor strain of purebred hogs. And then, sows that have not the proper feed cannot produce thrifty pigs, and if a purchaser, who is skeptical about the value of purebreds, eventually buys a poorly nourished pig, his trial with his first purebreds is started under a handicap. It is the poor specimens of purebred hogs and those fed improper rations that help on the argument in favor of crossbred hogs. Vigorous, growing purebred hogs, given proper feed and care are in a class much above crossbreds as money-makers, though for pork production the crossbreds often produce meat in every way as good as that from purebred stock. H. B. COBB.

"There's a GOOD Job! I Used Amatite ROOFING"

"NOW I have the best roof in this township. One that will last—one that's waterproof—one that will resist the hardest storms—and I didn't have a bit of trouble laying it."

That's about what every Amatite owner says. Its superiority over all other ready roofing is apparent to any one who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface that *needs no painting.* It is durable, fire retardant, practical, economical.

Don't buy any other roofing till you look up Amatite.

Sweet Clover and Sweet Soil.

We have a newspaper clipping from an Oregon reader which states a new experienee with Sweet clover. A farmer lived in what is known as "alkali" land. He bought what he supposed was Alfalfa seed. It grew and made a fine crop, but instead of being Alfalfa it proved to be Sweet clover. This substitution proved to be a good thing for this farmer, for the Alfalfa would not grow on that kind of soil.

We have never tested Sweet clover on the Western alkaline soils but probably this newspaper elipping is more or less accurate. These alkaline soils simply contain an excess of what most Eastern soils are deficient in, that is lime, different forms of sodium, magnesia and so forth. When they get sufficiently saturated with this alkali, ordinary plants refuse to grow in them. We would expect Melilotus to grow if any plant would, because we have no plant that relishes lime more than this one does. The gist of the matter is that these Western soils, owing to very scanty rainfall, and praetieally no leaching whatever, retain their mineral salts, ineluding the lime, magnesia, different forms of soda, ete., until they become actually too sweet and are ealled alkaline.

The clipping as far as it relates to alkaline conditions, is of no value to farmers living east of the Missouri River, because with our liberal rainfall and eonstant leaehing, we are defieient in these same mineral salts. We would expeet somewhat similar experience to what is related in this clipping, although we would have to be shown that dairy eows would produee more milk on Melilotus hay than they would on Alfalfa hay. We think they might produee as much, but question their doing more. It is not accurate, in our opinion, to expect quite as mueh hay or at least as many cuttings as these farmers expect from Melilotus, at least in the corn belt. We figure that we are lucky to get a light cutting the first year, one heavy cutting which must be mown a foot high in June the second year, and then a moderate seed erop to follow. After this the plant dies. CHAS. B. WING.

Ohio.

County Fairs Without Racing.

A number of years ago you published an aceount of a county fair, I think it was in Maine, where no horse raeing nor any snide game or booth where a person would be cheated was allowed on the ground. We had a very suceessful fair here last Fall, but the racing and bilking games were there, and I want to start missionary work here to eliminate all but square deals. The raeing may be on the square, but I want that stopped also, not on moral grounds, but because I think the people's money eould better be spent in paying additional premiums on useful products. If you could dig up that old aceount of that raeeless fair and send it to me I think I could make good use of it. Here is a summary of the financial aecount of our county fair.

RECEIPTS.

Racing entries	$280.00
Poultry entries	52.45
Livestock entries	41.50
Concessions	266.13

EXPENDITURES.

Paid for racing horses	$1,052.87
Paid for all other prizes and premiums	834.33

You will see that the horses got more than all other produets combined. I think that if that racing money was used to pay premiums on useful products that it would draw a larger crowd than the way it is used. Have you heard lately how that fair is getting along without the raees? C. B. S.

Forest Grove, Ore.

R. N.-Y.—We have had no reeent reports about that fair. There must be others, however, with a similar experienee. Let us hear from anyone who can give us the faets.

A Pennsylvania Storage House.

I read on page 258 a query for cold storage house from C. L., Ringtown, Pa. Two years ago we had to eonsider the same problem. After investigating some of the different types we deeided on the underground cellar. We have a bank barn, and built the storage so that one end projeeted past the end of barn far enough to allow an entranee through stable for convenienee in Winter. There is also an outside entrance in end which we close up in Winter. The house is eoncrete side walls five feet high, eight inehes thiek. The roof is arched. We used building blocks for roof thinking that dead air space would keep frost out, but would not do it again, as we covered it over with dirt, so the solid conerete would have answered and not been so expensive. The house is 30 feet long, 12 wide and eight high. We have never had more than 1,200 bushels in at onee, but think it would hold 1,500. We have one ehimney in end. In Fall we open at night and can cool to within two degrees of outside temperature, and close up in daytime. From October 20 to April 20 we have held the temperature at 33 to 36 degrees and there would be nearly a week at a time without a frost at night.

We prefer the dirt floor, as it is better eonductor of moisture, and to keep fruit in good shape requires lots of it. We have had a little trouble with frost coming through the roof, but that can be remedied by adding more dirt. A lantern has been all that is required to keep it warm enough in Winter, and it was only needed a few days. We kept Northern Spy apples until July last year, and they were as crisp as when put in. I do not think this could be done with the two-story house, as the building above is too good a conduetor of heat.

Butler Co., Pa. C. R. OLIVER.

PATERFAMILIAS was admiring a new electrie motor-car recently purchased by a friend, but deplored the faet that as he lived in a small town he would have diffieulty in getting it charged were he to purchase one like it. Suddenly his small son piped out: "Have it charged on the grocery bill; that's what mamma does when she wants anything."—Harper's Magazine.

Plant 7 to 10 Acres daily. One horse enough. Acts automatically, regularly dropping seed and fertilizer at just the distance you set it. *Important!* None of the working parts move while drive wheel revolves except at the time of planting. It's accurate and positive every time. Rightly is this great machine named

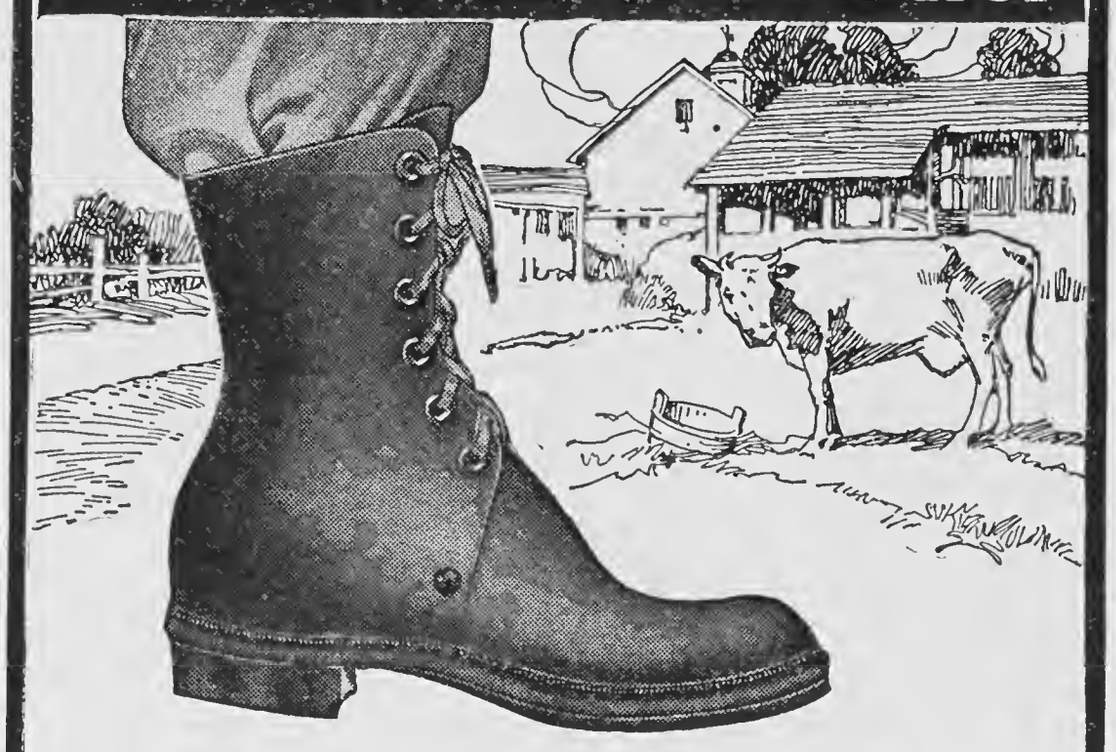
"Better than leather For all kinds of weather"



You Won't Have To "Break In" These Money-Saving Shoes

You dread to put on new shoes. Why not escape the suffering, the aches, and the pains of new leather shoes.

Wear **Hub-Mark Bootees.** They are made from pure rubber and pliable duck with staunch, leather insoles. You will find them warm, and easy on your feet from the very beginning. These comfortable bootees are not stiff. Yet they are tough enough to always wear longer than the best leather work shoes.

Leather is getting dearer all the time. The automobile makers are taking the choicest of it away from the shoe men. That's why shrewd men are buying **Hub-Mark Bootees** with the knowledge that they spend less for their footwear, and get better value.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

The Henyard.

THE EGG-LAYING CONTEST.

The eighteenth week of the contest shows the remarkable gain of 615 eggs over the previous week; 19 pens laid 40 eggs or more during the week. Frederick H. Benton's pen of White P. Rocks made the highest score, 48; and the Dunghills, Daniel Hine's pen, came second with a score of 46. Tom Barron's White Leghorns laid 45; they tie with Glenview Poultry Farm, their White Leghorns also laying 45. Harry B. Cook's S. C. Reds laid 44. Tom Barron's White Wyandottes laid 43, and one of Storr's Agricultural Station's pens of White P. Rocks also laid 43. Barron's White Wyandottes are 127 eggs ahead of the next best pen. The total number of eggs laid this week was 2,657. In this extremely cold month of February, with deep snows and blustering blizzards, 7,860 eggs were laid.

The pen producing the largest number was Dr. J. A. Fritchey's S. C. Reds. They laid 161 eggs, Tom Barron's White Wyandottes being a close second, with 159. Below is given the record of the leading pens for the eighteenth week, and the totals:

Mr Barron writes me that his surplus stock of White Leghorns are all sold. He can take no more orders for Leghorns until next Fall. He has over 1,000 chicks hatched out now, February 1. Many readers of THE R. N.-Y. write me to know if eggs can be safely imported from England—that is, eggs for hatching. In reply I would say that it depends almost wholly on the weather encountered coming over. If it is a smooth passage they will hatch very well; if it is rough, there is liable to be a poor hatch. GEO. A. COSGROVE.

A Recent

U. S. Government Report

Makes plain your need of a

UNITED STATES CREAM SEPARATOR

The skimming device of which is GUARANTEED NEVER TO RUST.

The scientific staff of the dairy division in the **United States Department of Agriculture** recently conducted a series of experiments to learn what effect, if any, iron (rust) has on cream and butter.

The tests definitely established the fact that **even minute particles of iron (rust) caused certain undesirable flavors** and that in every instance when butter was scored a few days after the making, **the samples in which iron (rust) was present scored lower than the butter made from cream which contained no iron (rust).**

In using the United States Cream Separator with non-rusting skimming sections of **nickel silver** you avoid all risk of having "metallic" butter. **The U. S. sections are positively guaranteed never to rust.** No other separator manufacturer gives you a printed non-rusting guarantee.

Yet, United States Cream Separators with this big exclusive improvement are sold at **no higher prices** than other separators without it.

It is time well spent to learn from your U. S. dealer or us more about the exclusive U. S. non-rusting feature.
